A MONTHLY MAGAZINE DEVOTED TO THE PROMOTION OF TRUE CULTURE. ORGAN OF
THE CHAUTAUQUA LITERARY AND SCIENTIFIC CIRCLE.

VOL. IV.

OCTOBER, 1883.

No. 1.

Chautauqua Literary and Scientific Circle.

President—Lewis Miller, Akron, Ohio.

Superintendent of Instruction—Rev. J. H. Vincent, D.D., New Haven, Conn.

Counselors—Rev. Lyman Abbott, D.D.; Rev. J. M. Gibson, D.D.; Bishop H. W. Warren, D.D.; Rev. W. C. Wilkinson, D.D.

Office Secretary—Miss Kate F. Kimball, Plainfield, N. J.

General Secretary—Albert M. Martin, Pittsburgh, Pa.

REQUIRED READING

FOR THE

Chautauqua Literary and Scientific Circle for 1883-4.

OCTOBER.

GERMAN HISTORY.

By REV. W. G. WILLIAMS, A. M.

I.

The student of history has need of divisions. By their aid alone can he hope to have command of the facts and events with which history in so large part deals. It is well therefore to begin the study of any particular history by noting such changes, such epoch-making events as may form partition walls of boxes in which may be placed our classified information.

The history of Germany has been variously divided into periods by the different authors. That which we have adopted here has the sanction of the majority and will be found exceedingly natural, and hence simple and convenient. The student should memorize it thoroughly, being assured that though a very *general* history of itself, nevertheless it is more than many of supposed information could tell of the history of this wonderful people.

DIVISION OF THE HISTORY OF THE GERMANS INTO TEN PERIODS.

First—From the most ancient times to the conquests of the Franks, under Clovis (A. D. 486).

Second—From conquests of Clovis to Charlemagne (511-768).

Third—Charlemagne to Henry I. (768-919).

Fourth—Henry I. to Rodolphus of Hapsburg. The Saxon, Swabian, and Hohenstaufen houses (919-1273).

Fifth—Rodolphus I. of Hapsburg to Charles V. (1273-1520).

Sixth—Charles V. to Peace of Westphalia (1519-1648).

Seventh—Peace of Westphalia to French Revolution (1648-1789).

Eighth—French Revolution to Peace of Paris (1789-1815).

Ninth—Peace of Paris to Franco-Prussian War (1815-1870-1871).

Tenth—From Franco-Prussian War to present time.

THE PRIMITIVE POPULATIONS OF GERMANY, THEIR ORIGIN, CUSTOMS, RELIGION, ETC.

"Germany, or Deutschland, occupies a large part of Central Europe. Speaking roughly, it now reaches from the Alps to the Baltic and the North Sea, and from the valleys of the Rhine and the Maes to the Danube as far as the March and the Mur,

and to the Prosna and the Lower Niemen. The country is mountainous in the south, hilly in the center, and flat in the north, where it forms part of the great plain which takes in the whole of north-eastern Europe. The western part of this plain takes in the country between the Teutoburg Wood and the North Sea. As it passes eastward it widens till it reaches from the Erz and Riesen Mountains to the Baltic. A part of South Germany slopes toward the east, and is watered by the Danube; but the general slope of the country is toward the north. Among the rivers flowing northward are the Rhine, the Ems, the Weser, the Elbe, the Oder, and the Vistula."—*Sime.*

"Germany has varied very much in extent at different times. This is due partly to the fact that it has no clearly-marked natural boundaries on the east and west, but chiefly to the peculiarity of its position. It is the central country of Europe. Being surrounded by most of the leading nations of the Continent, the Germans have been involved, more than any other people, in the general history of Europe. Of all their neighbors, the Scandinavians are most nearly allied to the Germans. Both are branches of the Teutonic race. But the Germans are also connected, although not so closely, with the other surrounding peoples. All, if we except the Magyars or Hungarians, who are Turanians, belong to the great Aryan family."—*Sime.*

"Ancient authors mention several German tribes, as well as their dwelling places, with greater or less precision. Several of them also speak of the chief tribes, among which the single septa united themselves. But their statements are not sufficiently unanimous or precise to give us that clear view which we would so willingly obtain. The origin of the Germanic nations, therefore, like that of all others, is uncertain. To assign to them a distinct historical origin is to make an assertion without evidence, though it is now indisputably established that the Teutonic dialects belong to one great family with the Latin, the Greek, the Sanscrit, and other European and Asiatic tongues. All the positive knowledge that we have of the German nations, previous to their contact with the Romans, is exceedingly vague and mere conjecture."—*Menzies.*

"The Romans first heard the name 'Germans' from the Celtic Gauls, in whose language it meant simply *neighbors*. The first notice of a Germanic tribe was given to the world by the Greek navigator Pytheas, who made a voyage to the Baltic in the year 330 B. C. Beyond the amber coast, eastward of the mouth of the Vistula, he found the Goths, of whom we hear nothing more until they appear, several centuries later, on the northern shore of the Black Sea. For more than two hundred years there is no further mention of the Germanic races; then, most unexpectedly, the Romans were called upon to make their personal acquaintance."—*Bayard Taylor.*

"At the time of their first contact with the Romans, these Germanic tribes had lost even the tradition of their Asiatic origin. They supposed themselves to have originated upon the soil where they dwelt, sprung either from the earth or descended from the gods. According to the most popular legend, the war-god Tuisko, or Tiu, had a son, Mannus (whence the word *man* is derived), who was the first human parent of the German race. Many centuries must have elapsed since their first settlement in Europe, or they could not have so completely changed

the forms of their religion and their traditional history."—*Taylor.*

MANNERS AND CUSTOMS.

"The early Germans were noted for their love of feasting, which was carried to such excess that they would sometimes spend whole days and nights at table, drinking and gaming, in consequence of which they often quarreled and fought so that a convivial meeting frequently terminated in bloodshed. They gambled with dice, as Tacitus, with astonishment, informs us, in a sober state and as a serious occupation, and with so much eagerness for gain, that when they had lost all they hazarded their freedom, and even their very persons, upon the last cast. The loser freely delivered himself up to slavery, although even younger and stronger than his adversary, and patiently allowed himself to be bound and sold as a slave; thus steadfastly did they keep their word, even in a bad case. 'They call this good faith,' says the Roman writer. There were various circumstances under which a German might forfeit his liberty, such as marrying a bondwoman, or of not being able to pay his debts; but the generality of the slaves were captives taken in war.

"The Germans did not all sit down at the same table, but each man had his own seat and board, which were of a very rough description, being merely a wooden stool and table, furnished with drinking horns, wooden bowls, spoons, and platters. Each person of rank had his servant behind him to hold his shield and spear. He kept his sword by his side, for on no occasion would a German part with his arms, which was a proof that he expected to have frequent need of them.

"The wives and daughters of the Germans, we are told, shared in all the public entertainments, for however rude and fierce these people might be in other respects, they were distinguished, even in the most barbarous ages, for their attention and respect to the female sex, whom they consulted on the most important affairs, and by whose opinions they were very often guided. The feasts of the Germans, like those of the Gauls and Scandinavians, were always attended by a number of bards, several of whom were attached to the family of every chief, and were treated with the highest respect. They played on the harp and flute, and when they sang of war, the company took part in the concert by clashing their swords against their shields.

"The Germans, in very remote ages, were dressed in skins of wild animals, and afterward in a coarse kind of linen, made by the women; but as they intermixed more with the Gauls, they learned from them to make a finer sort of linen, and woolen also, and as soon as they were acquainted with these useful arts, spinning and weaving became the principal occupations of German women, and a more civilized costume was adopted than that which was made from the skins of the elk and reindeer. These animals, in the time of Julius Cæsar, were very numerous in the forests of Germany, from which, however, they have long since disappeared.

"The Romans justly considered the German nation as an aboriginal, pure, and unmixed race of people. They resembled themselves alone; and like the specifically similar plants of the field, which, springing from a pure seed, not raised in the hot-bed of a garden, but germinating in the healthy, free, unsheltered soil, do not differ from each other by varieties; so, also, among the thousands of the simple German race, there was but one determined and equal form of body. Their chest was wide and strong; their hair yellow, and with young children it was of a dazzling white. Their skin was also white, their eyes blue, and their glance bold and piercing. Their powerful gigantic bodies, which the Romans and Gauls could not behold without fear, displayed the strength that nature had given to this people; for, according to the testimony of some of the ancient writers, their usual height was seven feet. From their earliest youth upward they hardened their bodies by all devisable means. New-born infants were dipped in cold water, and the cold bath was continued during their whole lives as the strengthening renovator, by both boys and girls, men and women. The

children ran about almost naked, and effeminate nations wondered how those of the Germans, without cradles or swaddling bands, should grow up to the very fullest bloom of health.

"Cæsar, Tacitus, and Suetonius, with many others, have pointed to one and the same characteristic of the Germans, as the secret of their power and prosperity. The Kelt had everywhere yielded to the eagles of Rome, while the Teuton everywhere checked their flight. Amazed, and even alarmed, at those tall, fair-haired, blue-eyed enemies, who had to be conquered with gold instead of steel, Tacitus examines the reasons of their prowess, and finds it in the soberness of their blood, in their reverence for women and for the laws of nature, in their deference to parental authority and their marriages of maturity. 'Chastity is a custom with them,' says the 'De Moribus Germanorum,' and a passage to the same effect might be cited from Cæsar. Those southern soldiers and statesmen saw, in truth, with a terrible sense of overhanging fate, that race of hardy, chaste, home-loving, free and fearless barbarians, of whom the Emperor Titus said, 'Their bodies are great, but their souls are greater.' The tone of Tacitus is that of a man who bitterly feels how much greater, after all, as a moral being, the barbarian may be than the civilized man, when civilization recognizes no higher aim than material splendor, and that utility which subserves material wants. Other civilizations than that of the Empire may read a lesson in those brief pages where the philosopher of a worn-out world records his impression of the races from which the world was hereafter to be reconstituted."

—*Menzies.*

"The three principal vices of the Germans were indolence, drunkenness, and love of gaming. Although always ready for the toils and dangers of war, they disliked to work at home. The women ruled and regulated their households with undisputed sway. They were considered the equals of the men, and exhibited no less energy and courage. They were supposed to possess the gift of prophecy, and always accompanied the men to battle, where they took care of the wounded, and stimulated the warriors by their shouts and songs. They honored the institution of marriage to an extent beyond that exhibited by any other people of the ancient world. Those who proved unfaithful to the marriage vow were punished with death."—*Taylor.*

RELIGIOUS BELIEFS AND USAGES.

"The worship of the ancient Germans coincided with their natural character, and consequently was much more simple and elevated than that of other peoples. Although uncultivated, they carried in their hearts the sentiment of an infinite and eternal power, and they regarded it as an affront to the divinity to enclose it within walls, or to represent it under human form. They consecrated to it the woods and forests as a spacious temple of which nature itself erected the pillars, and to which the immensity of the heavens formed the roof.

"The ancient Germans adored, like the Persians, the sun and fire, but they regarded Wodan as their supreme god. They called him also Alvater, father of all things. Their most beneficent goddess was the mother of the earth (Hertha). The Germans attached great importance to divinations and prognostics. The crow and the owl signified misfortune; the cuckoo announced long life. They discovered the future by means of the branches of fruit trees (runes). Various signs were cut upon each rod, and afterwards the rods were thrown upon a white cloth; then the priest, or father of the family, offered up a prayer to the divinity, and thrice chose from among the rods those which were to give the divine revelations. The clairvoyants were held in high estimation, and history has preserved some of the names of those to which the belief of the people had given a great influence over the decision of public affairs."—*Menzies.*

"The people had their religious festivals at stated seasons, when sacrifices—sometimes of human beings—were laid upon the altars of the gods in the sacred groves. Even after they became Christians, in the eighth century, they retained their

habit of celebrating some of these festivals, but changed them into the Christian anniversaries of Christmas, Easter, and Whitsuntide.

"Thus, from all we can learn respecting them, we may say that the Germans, during the first century before Christ, were fully prepared by their habits, laws, and their moral development, for a higher civilization. They were still restless, after so many centuries of wandering; they were fierce and fond of war, as a natural consequence of their struggles with the neighboring races; but they had already acquired a love for the wild land where they dwelt, they had begun to cultivate the soil, they had purified and hallowed the family relation, which is the basis of all good government, and finally, although slavery existed among them, they had established equal rights for free men.

"If the object of Rome had been civilization, instead of conquest and plunder, the development of the Germans might have commenced much earlier and produced very different results."—*Taylor*.

[To be continued.]

PHYSICAL SCIENCE.

I.—THE AIR.

When we begin to look attentively at the world around us, one of the first things to set us thinking is the air. We do not see it, and yet it is present wherever we may go. What is this air?

Although invisible, it is yet a real, material substance. When you swing your arm rapidly up and down you feel the air offering a resistance to the hand. The air is something which you can feel, though you can not see it. You breathe it every moment. You can not get away from it, for it completely surrounds the earth. To this outer envelope of air, the name of *atmosphere* is given.

The air is not a simple substance, but a mixture of two invisible gases, called nitrogen and oxygen. But besides these chief ingredients, it contains also small quantities of other substances; some of which are visible, others invisible. If you close the shutters of a room, and let the sunlight stream through only one chink or hole into the room, you see some of the visible particles of the air. Hundreds of little motes, or specks of dust, cross the beam of light which makes them visible against the surrounding darkness, though they disappear in full daylight. But it is the invisible parts of the air which are of chief importance; and among them there are two which you must especially remember—the vapor of water and carbonic acid gas. You will soon come to see why it is needful for you to distinguish these.

Now what is this vapor of water? You will understand its nature if you watch what takes place when a kettle boils. From the mouth of the spout a stream of white cloud comes out into the air. It is in continual motion; its outer parts somehow or other disappear, but as fast as they do so they are supplied by fresh materials from the kettle. The water in the kettle is all the while growing less, until at last, if you do not replenish it, the whole will be boiled away, and the kettle left quite dry. What has become of all the water? You have changed it into vapor. It is not destroyed or lost in any way, it has only passed from one state into another, from the liquid into the gaseous form, and is now dissolved in the air.

Carbonic acid gas is also one of the invisible substances of the atmosphere, of which, though it forms no more than four parts in every ten thousand, yet it constitutes an important ingredient. You will understand how important it is when you are told that, from this carbonic acid in the air, all the plants which you see growing upon the land extract nearly the whole of their solid substance. When a plant dies and decays, the carbonic acid is restored to the air again. On the other hand, plants are largely eaten by animals, and help to form the

framework of their bodies. Animals in breathing give out carbonic acid gas; and when they die, and their bodies decay, the same substance is again restored to the atmosphere. Hence the carbonic acid of the air is used to build up the structure both of plants and animals, and is given back again when these living things cease to live. There is a continual coming and going of this material between the air and the animal and vegetable kingdoms.

You know that though you can not see the air you can feel it when it moves. A light breeze, or a strong gale, can be just as little seen by the eye as still air; and yet we readily feel their motion. But even when the air is still it can make itself sensible in another way, viz: by its temperature. For air, like common visible things, can be warmed and cooled.

This warming and cooling of the air is well illustrated by what takes place in a dwelling-house. If you pass out of a warm room, on a winter's day, into the open air when there is no wind, you feel a sensation of cold. Whence does this sensation come? Not from anything you can see, for your feet, though resting on the frozen ground, are protected by leather, and do not yet feel the cold. It is the air which is cold, and which encircles you on all sides, and robs you of your heat; while at the same time you are giving off or radiating heat from your skin into the air. On the other hand, if, after standing a while in the chilly winter air, you return into the room again, you feel a sensation of pleasant warmth. Here, again, the feeling does not come from any visible object, but from the invisible air which touches every part of your skin, and is thus robbed of its heat by you.

Now, how is it that the atmosphere should sometimes be warm and sometimes cold? Where does the heat come from? and how does the air take it up?

Let us return again to the illustration of the house. In winter, when the air is keen and frosty outside, it is warm and pleasant indoors, because fires are there kept burning. The burning of coal and wood produces heat, and the heat thus given out warms the air. Hence it is by the giving off or radiation of the heat from some burning substance that the air of our houses is made warmer than the air outside.

Now, it is really by radiation from a heated body that the air outside gets its heat. In summer, this air is sometimes far hotter than is usual in dwelling-houses in winter. All this heat comes from the sun, which is an enormous hot mass, continually sending out heat in all directions.

But, if the sun is always pouring down heat upon the earth, why is the air ever cold? Place a screen between you and a bright fire, and you will immediately feel that some of the heat from the fire place has been cut off. When the sun is shining, expose your hand to its beams for a time, and then hold a book between the hand and the sun. At first, your skin is warmed; but the moment you put it in the shade, it is cooled again. The book has cut off the heat which was passing directly from the sun to your hand. When the atmosphere is felt to be cold, something has come in the way to keep the sun's heat from directly reaching us.

Clouds cut off the direct heat of the sun. You must often have noticed the change of temperature, when, after the sun has been shining for a time, a cloud comes between it and the earth. Immediately a feeling of chilliness is experienced, which passes off as soon as the cloud has sailed on, and allowed the sun once more to come out.

The air itself absorbs some of the sun's heat, and the greater the thickness of air through which that heat has to make its way, the more heat will be absorbed. Besides this, the more the rays of heat are slanted the weaker do they become. At noon, for example, the sun stands high in the sky. Its rays are then nearest to the vertical, and have also the least thickness of air to pass through before they reach us. As it descends in the afternoon, its rays get more and more slanted, and must also make their way through a constantly increasing thickness

of air. Hence the middle of the day is much warmer than morning or evening.

At night, when the sun no longer shines, its heat does not directly warm the part of the earth in shadow. That part not only receives no heat from it, but even radiates its heat out into the cold sky. Hence night is much colder than day.

Then, again, in summer the sun at noon shines much higher in the sky with us, or more directly overhead, than in winter. Its heat comes down less obliquely and has less depth of air to pass through, and hence is much more felt than in winter, when, as you know, the sun in our part of the world never rises high even at mid-day.

If we were dependent for our warmth upon the direct heat of the sun alone, we should be warm only when the sun shines. A cloudy day would be an extremely cold one, and every night as intensely frosty as it ever is in winter. Yet such is not the case. Cloudy days are often quite warm; while we are all aware that the nights are by no means always very cold. There must be some way in which the sun's heat is stored up, so that it can be felt even when he is not shining.

In summer the ground gets warmed; in some parts, indeed, becoming even so hot at times that we can hardly keep the hand upon it. In hot countries this is felt much more than in this country. Soil and stones absorb heat steadily, that is to say, soon get heated, and they soon cool again. When they have been warmed by the sun, the air gets warmed by contact with them, and keeps its heat longer than they do; so that even when at night the soil and stones have become ice-cold, the air a little above is not so chilly. On the other hand, when the surface of the ground is cold, it cools the air next it. The ground parts easily with its heat, and a vast amount of heat is in this way radiated at night from the earth outward into the cold starry space. Much more heat, however, would be lost from this cause did not the abundant aqueous vapor of the atmosphere absorb part of it, and act as a kind of screen to retard the radiation. This is the reason why in hot climates, where the air is very dry—that is, contains a small proportion of the vapor of water—the nights are relatively colder than they are in other countries where the air is moister. In like manner, clouds serve to keep heat from escaping; and hence it is that cloudy nights are not so cold as those which are clear and starry.

The atmosphere, then, is heated or cooled according as it lies upon a warm or cold part of the earth's surface; and, by means of its aqueous vapor, it serves to store up and distribute this heat, keeping the earth from such extremes of climate as would otherwise prevail.

The air lying next to a hot surface is heated; the air touching a cold surface is cooled. And upon such differences of temperature in the air the formation of winds depends.

Hot or warm air is lighter than cold air. You have learned how heat expands bodies. It is this expansion of air, or the separation of its particles further from each other which makes it less dense or heavy than cold air, where the particles lie more closely together. As a consequence of this difference of density, the light warm air rises, and the heavy cold air sinks. You can easily satisfy yourselves of this by experiment. Take a poker, and heat the end of it in the fire until it is red-hot. Withdraw it, and gently bring some small bits of very light paper, or some other light substance, a few inches above the heated surface. The bits of paper will be at once carried up into the air. This happens because the air, heated by the poker, immediately rises, and its place is taken by colder air, which, on getting warmed, likewise ascends. The upward currents of air grow feebler as the iron cools, until, when it is of the same temperature as the air around, they cease.

This is the principle on which our fire-places are constructed. The fire is not kindled on the hearth, for, in that case, it would not get a large enough draft of air underneath, and would be apt to go out. It is placed some way above the floor, and a

chimney is put over it. As soon as the fire is lighted, the air next it gets warmed, and begins to mount, and the air in the room is drawn in from below to take the place of that which rises. All the air which lies above the burning coal gets warmer and lighter; it therefore flows up the chimney, carrying with it the smoke and gases. You will understand that though a bright blazing fire is a pleasant sight in winter, we do not get all the heat which it gives out. On the contrary, a great deal of the heat goes up the chimney; and, except in so far as it warms the walls, passes away and warms the outer air.

What happens in a small way in our houses takes place on a far grander scale in nature. As already pointed out, the sun is the great source of heat which warms and lightens our globe. While the heat of the sun is passing through the air, it does very little in the way of warming it. The heat goes through the air, and warms the surface of the earth. You know that in summer the direct rays of the sun are hot enough to burn your face, and yet, if you put even a thin sheet of paper over your head, enough to cut off these rays, the sensation of burning heat at once goes off, although the same air is playing about you all the time.

Both land and water are heated by the sun's rays, and the same change in the air then takes place which we find also at our firesides. The layer of air next the warmed earth becomes itself warmed. As it thereby grows lighter it ascends, and its place is taken by colder air, which flows in from the neighborhood to take its place. This flowing in of air is wind.

One of the most important ingredients in the air is the vapor of water. Let us try to see, first of all, how it gets into and out of the air. And in this case, as before, you will find that great questions in science often admit of being simply and readily illustrated by the most familiar things.

You may have noticed that on very cold nights the windows of sitting-rooms, or crowded public halls, are apt to be found streaming with water on the inside.

Now, in such cases, where does the moisture come from? Certainly not out of the glass. It is derived from the vapor of water present in the air. This word vapor is often used to describe some kind of visible mist or fog. But these visible forms of moisture are not properly vapor in the sense in which the term is used in science. The aqueous vapor of the air is always invisible, even when the air is saturated with it, and only when it passes back into the state of water do you actually see anything.

When the invisible vapor dissolved in the air becomes visible, as in mists, clouds, dew, or rain, it is said to be condensed, and this process of liquefaction is called condensation.

The quantity of vapor which the air can contain varies according to temperature, warm air being able to hold more than cold air.

As the air is cooled, its power of retaining vapor diminishes. When it becomes colder than the temperature at which it is able to keep its supply of vapor dissolved, the excess of vapor is condensed and becomes visible. The temperature at which this takes place is the point of saturation, or dew-point.

Perhaps you may ask how it is that the vapor so universally present gets into the atmosphere, and where it comes from. If you pour a little water into a plate, and set it down in the open air, you will note in the course of a day or two, that the water has sensibly diminished. The air has drunk up part of it, and will drink up the whole, if the water is allowed to stand long enough. What takes place from a small quantity of water goes on from every surface of water on the face of the earth, from every brook and river and lake, and from the great sea itself. Water is constantly passing off into vapor, which is received and retained by the air. This process is called evaporation, and the water which passes off into vapor is said to evaporate.

Since warm air can hold more vapor than cold air, evaporation must be more vigorous in sunshine than at night, and during summer than during winter.

On a dry, bracing day, evaporation goes on rapidly, because the air has not nearly got all the quantity of vapor it can hold in solution. On a damp day, however, when the air contains about as much vapor as it can hold at that particular temperature, evaporation is quite feeble, or ceases altogether. This varying capacity of the air for vapor is the reason why laundresses find so much difference between days, in the ease with which they can have their clothes dried.

After sunset, when the sky is clear, you know that the grass gets wet with dew. In the morning you may see mists hanging over woods, and streams, and hills, and gradually melting away as the sun mounts in the sky. At all times of the year you may watch how clouds form and dissolve, and form again, ever changing their size and shape as they move through the air. Now these are all examples of the condensation of vapor. Let us see how the process takes place.

Condensation, as we have seen, results from a cooling of the air. When vapor is condensed, it does not at once take the form of running water. The cold glass brought into the warm room has first a fine film of mist formed upon it, and then by degrees the clear drops of water come. In reality mist is made up of exceedingly minute particles of water, and it is the running together of these which makes the larger drops. So in nature on the great scale, when condensation occurs the vapor first appears as a fine mist. This is always the result of cooling; so that, whenever you see a mist or cloud forming, you may conclude that the air in which it lies is being cooled.

Dew is the name given to the wetness which we notice appearing in the evening, or at night, upon grass, leaves, or stones, or even sometimes on our hair. In the morning you have, no doubt, often watched the little dewdrops sparkling upon the foliage and the delicate threads of gossamer. Now this wetness does not come out of the leaves or stones, nor out of your hair. It is all derived from the air by condensation, exactly as we see the film of mist form upon the cold tumbler in the warm moist air of a room. In fact, that film of mist was really dew, and all dew is formed in the same way, and from the same cause.

At night, when the sky is clear, the earth radiates heat rapidly; that is to say, it gives off into cold space a great part of the heat which it has received from the sun during the day. Its surface consequently becomes cold, as you may have felt when you put your hand upon leaves or stones after nightfall. The layer of air next the cooled ground is chilled below its point of condensation, and the excess of vapor is deposited as dew upon the grass, twigs, stones, and other objects. Hence it is that the temperature at which this condensation begins to take place is called the dew-point.

Another way in which a cold surface of the earth may produce condensation is shown by what takes place among mountains. When a warm moist wind blows upon a chill mountain top, the air is cooled, and its vapor becomes visible in the form of a mist or cloud. You can often see that the cloud is quite solitary, and even shapes itself to the form of the ground, as if it were a sort of fleecy cap drawn down over the mountain's head. This is often well marked in the morning. As day advances, the ground, warmed by the sun, no longer cools the air, and hence the mist is gradually re-absorbed into the atmosphere. But by and by, at the coming of night, when the ground is once more cooled by radiation, if there should be vapor enough in the air, the mist will re-form, and the mountain put on his cap again.

Cold air, as well as cold ground, condenses the vapor of warmer air. If you watch what goes on along the course of a river, you will often see examples of this kind of condensation. The ground on either side of the river parts with its heat after sundown sooner than the river itself does, and consequently cools the air above it more than the air above the river is cooled. So when this colder air from either side moves over to take the place of the warmer damp air lying on and rising from the river, condensation ensues in the form of the mist or river-fog, which

so commonly hangs at night and early morning over streams.

A cloud is merely a mist formed by the cooling of warm moist air, when it loses its heat from any cause, such as expansion during ascent, or contact with currents of cooler air. If you watch what goes on in the sky, you may often see clouds in the act of forming. At first a little flake of white appears. By degrees this grows larger, and other cloudlets arise and flock together, until at last the sky is quite overcast with heavy clouds, and rain begins to fall. The vapor which is thus condensed in the air has all been obtained by the evaporation of the water on the earth's surface. It rises with the warm air, which losing its heat as it ascends, and coming too in contact with colder layers of the atmosphere, can not hold all its vapor, and is obliged to get rid of the excess, which then condenses into cloud.

On a summer morning the sky is often free from cloud. As the day advances, and the earth gets warmed, more vapor is raised; and as this vapor, borne upward by the ascending air-currents, reaches the higher and colder parts of the atmosphere, it is chilled into the white fleecy clouds which you see forming about mid-day and in the afternoon. Toward evening, when less evaporation takes place, the clouds cease to grow, and gradually lessen in size until at night the sky is quite clear. They have been dissolved again by descending and coming in contact with the warm air nearest to the earth. Again, you have often noticed that clouds move across the sky. They are driven along by upper currents of air, and of course the stronger these currents are the faster do the clouds travel. In this way the sky is sometimes completely overcast with clouds which have come from a distance.

You are well aware that rain always comes from clouds in the sky. When the sky is clear overhead, no rain falls. Only when it gets overcast does the rain come. You can watch a dark rain-cloud gather itself together and discharge a heavy shower upon the earth. When a cold glass is brought into a warm room, you will remember that the film of mist formed upon the glass is found by degrees to gather into drops, and trickles down the cold surface. Now the mist on the glass and the cloud in the sky are both formed of minute particles of water, separated by air. It is the running together of these particles which gives rise to these drops. In the one case, the drops run down the cold glass. In the other case, they fall as drops of rain through the air. Rain, therefore, is thus a further stage in the condensation of the aqueous vapor of the atmosphere. The minute particles of the cloud, as condensation proceeds, gather more moisture round them, until at last they form drops of water, too heavy to hang any longer suspended in the air. These then fall to the earth as rain-drops.

But there is another important form in which the moisture of the clouds may descend to the surface of the earth. When the weather is cold enough, there fall to the ground not drops of rain, but flakes of snow.

If you bring snow indoors, it soon melts into water. If you expose this water for a time it evaporates. Snow, water, and aqueous vapor are thus only different forms of the same substance. We say that water can exist in three forms—the gaseous, the liquid, and the solid. Snow is an example of the solid condition.

On a frosty night pools of water are covered with a hard, transparent crust, of what is called ice. You may break this crust into pieces, but if the cold continues, a new crust will soon be formed with bits of the old one firmly cemented in it. And the greater the cold the thicker will the crust be, until perhaps the whole of the water in the pools may become solid. If you take a piece of this solid substance, you find it to be cold, brittle, and transparent. Brought into a warm room it soon melts into water, and you may drive off the water as before into vapor. Ice is the general name given to water when it is in the solid state, such forms as snow and hail being only different appearances which ice puts on. Whenever water becomes colder than a certain temperature it passes into ice, or freezes, and this temperature is consequently known as the freezing-point.

The upper layers of the atmosphere are much colder than the freezing-point of water. In the condensation which takes place there, the clouds do not resolve themselves into rain. The vapor of the up-streaming currents of warm air from the earth's surface is condensed and frozen in these high regions, and passes into little crystals, which unite into flakes of snow. Even in summer the fine white cloudlets which you see floating at great heights are probably formed of snow. But in those countries, such as ours, where in winter the air even at the surface is sometimes very cold, the snow falls to the ground, and lies there as a white covering, until returning warmth melts it away.

Besides rain and snow, the moisture of the air takes sometimes the form of hail, which consists of little lumps of ice like frozen rain; and of sleet, which is partially melted snow. But rain and snow are the most important, and it is these two forms which we must follow a little further.

Before doing so, let us gather together the sum of what has been said about the aqueous vapor of the air. We have learned that, as every sheet of water on the face of the globe evaporates, the air is full of vapor; that this vapor is condensed into visible form, and appears as dew, mist, and cloud. We have learned further, that the vapor of which clouds are formed is resolved into rain and snow, and, in one or other of these forms, descends to the earth again. There is thus a circulation of water between the solid earth beneath and the air above. This circulation is as essential to the earth in making it a fit habitation for living things, as the circulation of blood is in keeping our bodies alive. It mixes and washes the air, clearing away impurities, such as those which rise from the chimneys of a town. It moistens and quickens the soil, which it renders capable of supporting vegetation. It supplies springs, brooks, and rivers. In short, it is the very mainspring of all the life of the globe. So important a part of the machinery of the world deserves our careful consideration. Let us next attend, therefore, to what becomes of the rain and the snow after they have been discharged from the air upon the surface of the earth.

[To be continued.]

SUNDAY READINGS.

SELECTED BY REV. J. H. VINCENT, D.D.

[October 7.]

"TENDENCIES TO ERROR."

By REV. WILLIAM FRASER, LL.D.

"Let no one, upon a weak conceit of sobriety or an ill-applied moderation, think or maintain that a man can search too far, or be too well studied in the book of God's word, or in the book of God's works—divinity or philosophy—but rather let men endeavor an endless progress or proficiency in both; only let them beware that they apply both to charity and not to arrogance; to use, and not to ostentation; and again, that they do not mingle or confound these learnings together."—*Bacon*.

Many have lost their early faith in the Bible and are following its guidance with faltering footstep. Between them and hitherto accepted truths the sciences have been placing apparently insurmountable obstacles. The trustful simplicity with which they once read the sacred record has almost perished. Inferences by the man of science, conflicting with the interpretations of scripture by the theologian, have rudely shaken their most cherished convictions. They are not infidels, they are not skeptics, for doubt is distasteful to them, they long for more definite expositions and a firmer faith.

Such, possibly, may be some of you. In the midst of such discussions as are at present in progress, perplexity is not unnatural. Your most anxiously sustained investigations have hitherto only multiplied difficulties, and a sense of responsibility alone constrains you to linger over conclusions from which your judgment recoils. This hesitancy of belief may be at the outset disheartening; yet it may be inseparable from that clearness of insight and that force of character which, in the end, commonly create the stablest convictions, and evoke adequate

proof to shield them. To shun or to denounce you because you can not acquiesce in what we believe is inconsistent, not only with the lessons of philosophy, but with his example to "bear witness to the truth."

What is your duty, with the natural sciences on the one hand, appealing so largely to your reason, and the scriptures on the other hand, appealing so constantly to your faith? Obviously, to depreciate neither, but to welcome both the sciences and the scriptures, to ascertain their harmony, to note their differences, and to accept all the treasures of truth which they may bring. Indifference is inexcusable as is excessive zeal, and apathy as antagonism.

The Bible, free to us as are the fields of science, challenges the severest scrutiny. It is the boldest of books, and demands the application of every test. As it is the most comprehensive history in the world, and gives amplest scope for research; as its earliest records are the oldest in existence, and its latest prophecies shed light far into the future; as it touches depths and reaches heights which no other book can approach; as it brings into closest connection the visible and invisible, natural law and supernatural force, the condition of man and the character of God, it is exposed to assaults which no other book can bear.

Systematic and persistent study is required at your hand, that you may estimate aright not only the facts and arguments brought against the Bible, but those also which are adduced in its favor. The task may be arduous, but this price is not too great for the settlement of questions so momentous; and if the solution of some of them may have to be for a season postponed, yours will be the satisfaction which the conscientious improvement of every opportunity invariably fosters.

Different lines of investigation may be profitably followed, but we may suggest the following as exhaustive, or nearly exhaustive, of the most prominent questions which modern research has raised.

As the Bible is confessedly related to the natural sciences, archæology, history, and modern civilization, let it be placed successively in the midst of their facts, and let us see to what extent its statements can bear their light.

There are many questions which none of us can honestly avoid; and while some may remain unsettled, the unbiased review of those solutions which have been already offered, and which have been generally accepted, will be found to confirm scripture instead of confuting it.

1. As to science. Have astronomy and geology given evidence for or against the eternity of the visible universe? Has biology determined the origin of life? Whence it is? Have comparative anatomy and physiology, psychology and ethics, established more than one origin for the human race? Are the incidental allusions in scripture contradicted or confirmed in natural science?

2. As to archæology. Can the Bible confront prehistoric revelations? Antiquity is pouring over the oldest records, increasing light. Ruins, monuments, inscriptions, parchments, have been emitting their wondrous testimonies, parallel with scripture histories. Assyria, Egypt, Palestine, Greece, Rome, in their histories, revolutions, and domestic episodes, have all been interwoven with the statements of scripture as with those of no other book. To what purpose has historic criticism dealt with the sacred page? Is the Bible yielding or is it growing brighter in the crucible of archæology?

3. As to modern history and civilization. By its claim to uplift and bless the human race, the Bible is separated from all other books. It proposes to revolutionize man's moral history, here, and to prepare him for a future whose course it in part delineates. Has it failed, or is it failing? Has it been enfeebled by the lapse of ages? Has it become effete amid changes which have given intellect new instruments and reason new spheres? Has it lost its former hold of the human mind, and is it sinking amid the tumult of bitterly conflicting opinions? Has ever tribe

been found which it could not raise and enlighten? Or has ever civilization outshone, in any land, its intellectual and moral splendor?

4. As to the supernatural. If the Bible is the book which it professes to be, and which we hold it is, the ordinary and the extraordinary, the natural and the supernatural, must be associated in its character and history. What is the warrant which men of science adduce for repudiating the supernatural while they accept the natural? And by what reason does the Christian apologist attempt to preserve their connection? Is there no evidence around us in the contrasts of barbarism and civilization, as well as in the histories of nations, in their relation to prophecy? And are there no facts in the strangely revolutionized lives of thousands in the Christian church, which proclaim the singular moral force of the word of God?

[October 14.]

Assuming that you are willing to follow such a course of study as we have sketched, either to remove doubts which may be lingering in your own mind, or to aid some brother in his struggle to win the repose which you have gained, we shall, at the outset, offer some suggestions as to the spirit and the method by which your work should be characterized. It is of much importance to know, what is, and what is not, within our reach

1. Do not assume the possibility, in the present state of our knowledge, of demonstrating a perfect agreement between science and scripture, or rather between the inferences of the philosopher and the interpretations of the theologian. Much remains to be ascertained before that result can be realized. The natural sciences are confessedly incomplete; some of them are only in their infancy, and can teach us little. Many years may pass before they can be brought into perfect accord with the Bible. As the facts of natural science have not been all ascertained and classified, as its laws have not been all recognized, and as the inferences of to-day may be modified by the discoveries of to-morrow, it is absurd to be demanding immediate evidence of a perfect agreement between science and scripture. Apparent contradictions are, at the present stage unavoidable. There must first be an exact and exhaustive examination of all those points at which the scriptures and the sciences touch each other; for so long as a single fact or a single law remains unknown, some important or essential truth, intimately related to the Bible, may be concealed. While the natural sciences continue incomplete, natural theology must necessarily have an imperfect foundation. As confessedly dependent on what is incomplete, natural theology can have neither the comprehensiveness nor the definiteness which characterizes supernatural theology, as dependent on what is now complete and unvarying. We can not force the legitimate yet somewhat incoherent teachings of the one book—the works of God—of which but a few leaves have been separated, scanned and paged, into perfect harmony with the teachings of the other book, whose revelation of truth has been finished, accredited, and closed.

2. Wait patiently, while you work persistently, for the solution of difficulties which may be continuing to press upon you. The experience of the past is an encouragement for the future. The sciences have again and again become their own interpreter, and rejected erroneous inferences. Many examples might be given, but one or two may in the meantime suffice. Human skeletons were found in what seemed old limestone, on the northeast coast of the mainland of Guadeloupe; and after bold attacks on the Bible, which were met by some very weak and irregular defenses, it was ascertained that the whole was a mistake, that the limestone was of very recent formation, that the skeletons were of well-known Indian tribes, and agitation ceased. A similar commotion was raised when the supposed imprints of human feet on limestone had been figured and described in the *American Journal of Science*; and Christians met strange infidel hypotheses by feeble assertions, until Dr.

Dale Owen proved the imprints to have been sculptured by an Indian tribe. Thereafter, for a season, the scientific inquirer and the theological student prosecuted their respective investigations in peace. There are important lessons for us in these, and in many similar facts. Christian apologists have often egregiously erred, not only in hastily accepting statements as to supposed facts, but in admitting the validity of the reasoning which has been eagerly founded on them, and in making a fruitless attempt to twist scripture into harmony with what science itself has subsequently disowned. Facts ill observed, and afterward misstated, have drawn many of our best and most candid students into unnecessary collision with biblical critics; and, after much heat in controversy, and the waste on both sides of much intellectual energy, the obstacle lying between them has unexpectedly vanished in the fuller light of science. The evil to be deplored is, that after the errors have disappeared their influence remains. The imprint often lingers after the counterfeit die has been broken.

3. There is a constant tendency on the part of discoverers to invest new facts with a fictitious interest, and those who are hostile to the Bible eagerly parade them for the discomfiture of Christians. Every fact is to be welcomed, but it is to be treasured up only that it may be adjusted to other facts, and become in part the foundation of a new truth. Isolated and unexplained facts have been too often unceremoniously dragged in to give testimony against some scripture statement, and have too easily been held sufficient to push aside those accumulated evidences to its truth, which history, or science, or both, had indisputably established. It is not, indeed, surprising that the faith of many young men has failed, when they have observed the too ready acquiescence of prominent Christian writers in theories which necessitate the abandonment of some of the impregnable fortresses which have been raised by exact scholarship around those portions of scripture which had longest been exposed to the fiercest assaults. Were this method common, no permanent foundation could be laid, and progress in any science would be impossible. Is it not absurd to be displacing cornerstones, and disowning, at random, first principles? No system of philosophy, no science, not even mathematical, the exactest, and in one sense the most permanent of all the sciences, could have any weight or make the least progress if subjected to such changes in both its principles and their applications, as have marked the history of Bible assaults, concessions and defenses. When facts, which are utterly inexplicable are presented, we should retain the fact in science and also the relative statement in scripture, assured that in due time the solution will come.

[October 21.]

4. Neither accept nor offer apologies for the Bible. It has, of late, become common on the part of those who are alarmed by the temporary triumphs which scientific investigation has given to those who are avowedly hostile to the Bible, to demand that its propositions be altogether disassociated from both science and philosophy, on the plea that the Bible was not given to teach either the one or the other. The proposal is plausible, but it is really unnecessary, for although not given to teach physical science, the Bible can not contradict either its facts or its legitimate inferences. The word of God can not be regarded as by any possibility contradicting the just lessons of his works. Like every other book, the Bible must bear all the light that can fall on its pages; and it must not only stand the tests of criticism and history, but vindicate all its claims as the "more sure word of prophecy." Otherwise, appeals for leniency are profitless. True, in its highest connections, the Bible is unapproachable by other books; it is easily distinguishable from them all; yet in its human relations it must submit to all the ordinary appliances of scholarship. No apologies can justify a single error in either its science or its history, and its propositions are obviously inadmissible if they contradict human reason; they may be above, but they can not be opposed to it.

5. Akin to an easy escape from difficulties, through apologies for the Bible, is the tendency to glide into conclusions directly hostile. The prevailing activity of the age is so unfavorable to leisurely investigations as to facilitate the subtle advances of error. While many writers of the present day are as pre-eminently gifted, and as distinguished in the different departments of learning, as those of any preceding age; and while their reasonings and their conclusions are borne by the daily and the serial press to every man's door, multitudes think and decide by substitute. They want leisure, and trust to others. Rapidity of locomotion, the chief physical feature of our time, betokens also its intellectual tendencies. Men read cursorily and decide rapidly. The daily newspaper is making book-study rarer than hitherto. It is felt in ten thousand instances to be distasteful or difficult. The subtle influence of the daily newspaper is telling on our thoughtfulness. We really seem to be approaching the fulfillment of Lamartine's prediction, "Before this century shall have run out, journalism will be the whole press, the whole of human thought. Thought will not have had time to ripen, to accommodate itself into the form of a book. The book will arrive too late; the only book possible soon, will be a newspaper."

As one result of this process, truth and error are often imperceptibly mingled. So swift is the transition from one fact and inference to another, that truth and error, like different colors blent into one by rapid motion, become so much alike, that few can separate them. Thus with every advance of truth, error is wafted forward. The seeds of future tares and wheat are being profusely scattered. It can not be denied, that while to almost every man's door are daily wafted accurate records of passing history, of the discoveries of science, of the triumphs of art, and of the generalizations of philosophy, the same messengers no less sedulously exhibit, now faintly and now in the strongest light, every difficulty connected with the Bible, both real and imaginary, the boldest objections of historic criticism, the theories of speculative philosophy, the apparent contradictions of science and scripture, and the saddening conflicts of professing Christians. The constant diffusion of such influences does tell in the long run, not only on less active minds, but on the most energetic, and it renders easier of acceptance every erroneous conclusion.

But this incessant activity is a symptom of health. It augurs good. Rightly directed, it may strengthen character while it develops mental power, and gives a more exquisite appreciation of the just and true. But remember that everything depends on this rightness of direction; and to secure this, unfailing caution is required. The wind and tide which, rightly used, would hasten the voyager to his harbor, may, if unheeded, strand him on an unexpected shore; and those subtle forces, and those under-currents, which should have aided in guiding us to a satisfying intellectual and moral repose, may, through the thoughtlessness or the indolence that at the outset disregarded a slight divergence from the truth, almost but not altogether imperceptible, destroy our happiness through the shipwreck and the ultimate abandonment of our Christian faith.

6. Another common tendency in the wrong direction claims your attention. It manifests itself in repugnance to controversy or discussion in every form. Many shrink from it as unseemly, and seek escape in either solitude or study. While peace is in itself desirable, it is not always attainable. You cannot escape conflict by letting go the Bible; nor can you traverse any fields of science without entanglement in the intellectual struggles of disputants whose reasonings have sometimes but little of the calmness of philosophy. Nor is this to be regretted. The repose of meditation is not so bracing as the discipline of occasional contest for the truth.

[October 28.]

There are other advantages. The attrition of discussion often reveals and beautifies truths which would otherwise have

remained unrecognized. Apathy or silence may shelter error without preserving truth. Intellectual indolence, bad for the world, is still worse for the Church. The highest life is demanded by the Bible, and, therefore, also the greatest activity. From intellectual warfare, the sciences and the scriptures have nothing to lose, but everything to gain. On Christian or skeptic, on prophet true or false, the Bible never enforces silence. It seals no thinker's lip. "The prophet that hath a dream, let him tell a dream; and he that hath my word, let him speak my word faithfully. What is the chaff to the wheat? saith the Lord." In the field of thought, nothing save the chaff perishes. Lost truths spring up again; and, beneath their spreading branches, vitiated reasoning, unsound criticism, and erroneous conclusions, ultimately decay as briars beneath the spreading oak.

There are those also who deplore discussion only because it raises questions hostile to the scriptures, and alarms the weak. This anxiety, though laudable, is fruitless. Vital questions are already discussed on all hands, and in every variety of aspect. There are disadvantages, but they are generally inseparable from the progress of truth.

It will be admitted on both sides, that while the extension of exact knowledge contracts the sphere of superstition, it enlarges at the same time the sphere of skepticism. Superstition may be displaced without Christianity becoming its substitute; there may be a high and an attractive civilization, based on science and its applications, which, in acknowledging the intellectual and moral supremacy of the Bible, and nothing more, may for a season destroy credulity, only to give fuller scope to no-belief, and to evoke ultimately an opposition to the Bible hitherto repressed or unknown. For such results we must be prepared; they are collateral, not essential or direct. They are, in fact, the price which we pay for our intellectual freedom. We are neither to falter nor hesitate because the increasing light, which is dissipating ignorance and extending the boundaries of truth, is at the same time indirectly opening to error a wider field for the distribution of her forces, revealing new weapons for her armory, and enabling her to seize and for a season to retain, positions hitherto unknown and unassailed. In the history of the physical sciences, and of archæological discovery, error has often rushed to the battlements of truth, and, seizing some detached or imaginary facts, has wielded them against the Bible, until the sciences have themselves expelled her, and repudiated her reasoning. Such agitation is not to be deplored; it conducts to stability, it evokes more good than evil, and not unfrequently has it happened that the superstition which long benumbed the Church, and the infidelity which aroused her, have yielded to the unexpected sway of some Bible truth, when a more definite meaning has been given to some natural law or Providential dispensation.

Those misunderstand the character of the Bible who suppose its safety lies in keeping it as far as possible from the rigorous investigations and the exact conclusions of science or philosophy. Such a method is indispensable. To pursue truth in one department, implies, or should imply, not only a love of truth in every department, but also a resolute purpose to discover and dislodge every error. Which of the sciences, as preserved from controversy, is entitled to cast the first stone at the others, or their students? "Philosophy and literature," says Lord Kinloch, in an admirable work, "while professing to pursue truth in the composure of unruffled seclusion, and to be desirous of having it elicited by the healthy excitement of friendly debate, will protest against the dishonor of soiling their hands, or disarranging their robes in the turmoil of heated controversy; and least of all will they consent to be defiled with the mire or exposed to the perils of religious strife. This plea is false in fact, as it is futile in philosophy. It is in fact false; for literary and philosophical controversies have neither been few in number nor wanting in a keen and rancorous spirit. And, admitting that religious contentions have been still more

rancorous and embittered, it is only what might be reasonably expected, on account of the higher interests at stake. The plea is, moreover, worthless on philosophical principles; for it eviscerates the distinction between truth and error of all meaning and value. Better not to admit the distinction at all, than, having admitted it in one instance, deny it in another; or, what is worse, depreciate its significance even to thought, and that too in the most important of its applications. All argument and all effort are forever at an end, unless truth,—yea, all truth,—be precious; so precious, that in the legitimate pursuit of it we may and ought to put forth our utmost strength; and in defense of it, when found, incur the utmost hazard."

Do not be discouraged by apparently insurmountable obstacles. The boldest assertions and the most plausible reasonings need not disturb you. Difficulties seemingly insuperable have, in the past, suddenly vanished in the light of unexpected discoveries; and every science, you may rest assured, will hereafter show strength enough and light enough to purify its own temple and be its own interpreter. The past may be held to be prophetic of future solutions; and the sciences will be found not only correcting the mistakes and the arrogance of many of their students, but rebuking the too hasty concessions of Christian apologists, and either directly or indirectly revealing, at the same time, the impressiveness and the majesty of scripture truth.

POLITICAL ECONOMY.

By G. M. STEELE, D.D.

I.

I. DEFINITIONS—UTILITY OF THE SUBJECT.

1. Social science comprises the statement and explanation of the natural laws which govern men in their mutual relations. Political economy is the application of that portion of those laws which pertain to the production and distribution of wealth. Now we are not to be discouraged by this term *wealth*, as though the subject were one which concerns only rich men, and in which a poor man could have no interest. The man who has a little property, worth only one or two hundred dollars, is just as really a possessor of wealth as one who has one or two millions; and to be able to acquire and rightly use these small fortunes is, in the aggregate, of more importance than the acquisition and management of the greater riches of the few.

2. But what is meant by *wealth*? For the present it is enough to say that *it comprises all things which have value*. A more complete definition will follow by and by. What, then, do we mean by *value*? This, too, has many forms of definition, but they for the most part have one element in common. The general notion concerning it is that it has reference to the amount of one commodity that may be equitably given in exchange for a designated amount of another; this is a correct notion. Thus a bushel of wheat may be exchanged for two bushels of oats, or a cord of wood for twenty yards of cloth. That is, the value of a bushel of wheat is that of two bushels of oats, and the value of twenty yards of cloth is the same as that of a cord of wood. It is thus seen to be a *relative* term, and not indicative of any quality of any one thing considered by itself. But in all instances of relationship there must be some ground of the relation. Let us try to determine what it is in this case. A superficial thinker might decide that it is *money*, from the fact that value is generally estimated in money. But money is itself in the same relation to all other commodities in this respect as they are to one another, and its value rests upon the same basis.

3. The chief element in value, and that constitutes its original standard, is the *cost of production*; and by *cost* is meant the amount of labor involved. *Labor is the voluntary effort put forth by man to secure some desired object*. But when we say this, a little caution is needed. We are not to infer that the

present value of an article is estimated by the amount of labor required at the time of its production, especially if that was a long time ago. A hundred years since, it required the labor of a man for days to produce a yard of cotton cloth. A dozen yards of better cloth can now be produced by the same amount of labor; of course the present value of the latter is superior to the present value of the former, even if this were as good as new. It is the labor that would be required to *reproduce* or replace an article which determines its value.

4. But there is another element which is essential to value; this is *utility*. It comprises all those qualities in an object which make it available to gratify any desire. It will readily be seen that there are objects which have utility and at the same time are without value. They are such objects as cost nothing; that is, such as involve no labor in their acquisition. Thus air, and sunshine, and rain, have no value; but they are of immeasurable utility. Value is often in the inverse ratio of utility. Iron is a far more useful metal than gold, but gold is vastly more valuable than iron. Still, though utility may exist where there is no value, there can be no value where there is no utility; because no one would put forth effort for that which could not gratify any desire; and it is the ability to gratify desire that constitutes utility. Sometimes utility becomes the paramount element in determining value; but ordinarily it is subordinate to the cost of production. When the article is one for which there is a very great demand, and of which there is a great scarcity, the value may increase many times beyond the cost. In such case the utility rather than cost rules. But where the demand is readily and fully met by the supply, the cost controls.

5. But valuable things can not be produced very largely without tools, implements, and various contrivances. These constitute *capital*. *Capital is the result of previous labor reserved and employed in further production*. This implies self-denial. A man can not consume what he has secured by labor and at the same time preserve it to aid in additional production. Hence he must restrain his desires if he would save something for this purpose. This capital is sometimes called pre-existent labor. The point to be observed is that its existence is due, not to labor alone, but to *abstinence* as well. The two elements in the cost of production are labor and abstinence, and we may combine these in the one term, *sacrifice*. Sacrifice and utility, then, are the two essential conditions of value; and we may complete our definition of value by saying that *value is man's estimate of the amount of sacrifice requisite to the attainment of a desired object*.

6. Hence, if wealth comprises all valuable objects, and if every desirable object which involves sacrifice has value, it would be a proper definition to say that *wealth consists of all those objects and qualities useful to man, the attainment of which involves sacrifice*. This includes not only material objects and qualities, but also all those human powers acquired by sacrifice, which enable man to master nature. This is not admitted by many writers. But Mr. Carey states, in a broad way, that "Wealth is the power to command the always gratuitous services of nature." When man is at his weakest nature does nothing for him. Every infant, if dependent on nature alone, would inevitably perish. So in the infancy of society, it is only by the most strenuous exertion that a precarious existence is secured. But with every increment of power in man, nature multiplies her services. They are not bought but freely given, and given as soon as man is able to command them. In the most advanced civilization the forces of nature have become so subservient to man that in thousands of cases one can accomplish what a score, or sometimes even a hundred, could not formerly have done. It is this increase of power more than that of material commodities which constitutes the real wealth of the world.

7. From this it follows that the proper subject of political economy is MAN. The laws pertaining to the underlying science

are found in the nature and character of man—in his tastes, his desires, in the motives influencing him and in the limitations to which he is subject. The results to be achieved are his prosperity and freedom, his mastery over nature, and his happiness. Here, then, is the prime reason why every person who aspires to any intelligence at all should have some acquaintance with this subject. It has to do more than any other study with his temporal welfare, and with the welfare of society, without the prosperity of which his individual prosperity will suffer.

8. A second reason is implied in the meaning of the terms used. Economy is from a Greek compound signifying *husbandry*. It has reference to the prudent management by a householder of his means so as to secure the largest measure of prosperity for his family. It does not mean parsimony, nor even mere frugality; that is, it does not consist in mere abstinence for the sake of saving. It is rather a wise use of means and forces, so as to make them as effective as possible. There is an old proverb which says, "There is more in calculation than in hard work," and though sometimes perverted in the interest of human laziness, it is nevertheless full of philosophy. It is this "calculation" which such a study greatly aids.

9. *Political* economy, as the term implies, has reference to man in society,—to "the body politic." The social element in man is as imperative as any part of his constitution. Man's greatest need is *association*. The solitary individual is only a minute constituent of man in man's relation to the main purposes of life. No man is complete in himself. He must be supplemented by others, generally by many others, and he must find a large part of his own completeness in this association. Each has something that others lack, and we are designed to be sources of mutual supply to our several wants.

Here emerges another vital fact. *Individuality* is as indispensable as association. A superficial thinker might regard these characteristics as antagonistic. The fact is so far otherwise that each is really dependent on the other. Men must *differ* in order to be of any use to one another. It is the difference that makes the individuality. Mutual aid is the object of association. Hence the greater the difference, the greater the individuality; and the greater the individuality, the greater the association. No man would associate with another unless the one had something which the other lacked. But for this there would be no commerce. Two farmers producing nothing but wheat would have nothing to exchange with each other. Two men of precisely the same mental possessions, habits and attitudes, would never be companions for each other.

On the other hand it is only by association that individuality becomes the most highly developed. Only by such development do the differences among men become great and numerous. In the lower grades of humanity there is comparatively little difference between individuals, and there is little association. It is only in advanced civilization that a strongly marked individuality exists, and that we find those numerous differences which make the mutual dependence the greatest. Here is a potent reason for the study of this subject. It is impossible to estimate the power of association in production alone. It is known in a general way that the combination of men gives greatly increased results as compared with those of men working separately. Yet it is not nearly realized that a hundred men properly associated in an industrial enterprise will often effect two or three hundred times as much as all the very same men working separately.

10. Again, this subject intimately concerns man in his governmental relations. For governments must furnish many of the conditions for the best economical results. Then, too, the great moral enterprises of the age, and of all ages, have to do with the principles here involved; education, pauperism, vicious social usages, the dangerous classes, have to be considered, and can only rightly be considered in the light of these truths. It is wonderful how closely this study is connected with all the great interests of humanity. Whole communities

which have been impoverished and demoralized by neglecting some of the obvious principles of political economy, have revived and prospered under their application. Portions of our own country are examples of both these kinds of effects, and that, too, within the memory of men now living.

We shall follow the usual plan of the division of the subject under the heads of *production, consumption, exchange and distribution*.

II. PRODUCTION—LABOR.

1. *Production is the creation of value by rendering the utilities of nature available to man.* The creation, it will be noticed, is not of matter but of value. There are two great agencies which must co-operate in production—*nature* and *man*. Man furnishes labor; nature furnishes materials and forces. The former would be useless without the latter. There must be soils, and mines, and trees, and animals, or no matter how much labor there may be, there can be no grain, nor fruit, nor metals, nor lumber; no houses and no meat, nor hides nor leather. So also there may be all kinds of material, but without labor they are of no available service to man.

2. But nature furnishes not only materials but also forces to aid man in his productive efforts. The more obvious and palpable of these are gravitation, especially in falling water, wind, the explosive property of gunpowder and dynamite, the expansive power of steam, magnetism, electricity, and the forces of vegetation. There are also numerous passive powers, or properties of matter which, when adapted by man, give him much advantage; such are the mechanical powers of the lever, inclined plane, wheel and axle, pulley and wedge, and those qualities of the metals which render them capable of taking an edge for cutting purposes, as also malleability, ductility, elasticity, etc. It is a beneficent fact of nature that she furnishes these materials and forces gratuitously. She is not churlish nor parsimonious in this respect. The more we avail ourselves of her help, the more ready she is to help us; and the greater the advantage we obtain, the more lavishly she bestows her gifts upon us.

It is thus seen that labor consists not in creating things but in *moving* them; that is, in effecting changes. It directs the natural forces to the service of man, and it is in this that production consists. It can move materials into position where these forces can act upon them with the desired effect. Thus an agricultural laborer can effect such changes in the soil as are requisite to the growth of corn; he can place the seed in the ground, but he can not make the crop. It is as impossible for him to create a kernel of grain as to create a planet. Labor may move the fuel to the fire-place and properly dispose it for kindling. It may move a match, which by a previous movement has taken fire, to the prepared fuel; but all this would be useless but for the conditions and forces which nature furnishes.

3. The application of labor to production is of two kinds, *direct* and *indirect*. The direct changes effected by labor may be embraced under the three heads of *transmutation, transformation, and transportation*. The first comprises elementary changes, as when under required conditions ingredients of the soil and of the atmosphere are changed into grain and vegetables, and fruit. The second is where there is simply a change in the form of the material, as when boards are made into a table, or leather into shoes. The third implies merely a change of place, as when coal in a mine, where it has no value, becomes valuable by being brought within reach of those who desire it for fuel.

4. The greater part of labor is indirect; in some cases so much so that its relation to the product is unseen. For instance, the man who makes your shoes is not the only laborer concerned in that product. Some previous labor produced the leather, and before that some labor produced the hide from which the leather was made; some persons made the tools, some the house or shop, and some provided sustenance for the shoemaker. All these are conditions, without which no shoes can

be made, and all who provide them furnish a part of the labor on which the product of the shoes depends.

Of this indirect labor there are several kinds. (1) Those who provide the materials, and there may be many grades of these; (2) those who furnish the implements and the machinery; (3) those who supply the sustenance and shelter, and raiment for the laborers; (4) the government agencies for protecting the workman; (5) organizers and managers of business enterprises, without whom production would often fall far short of what it now accomplishes; (6) the labor of raising children who are subsequently to become laborers; (7) all those engaged in the work of education, by which men are prepared for the most efficient work—this includes not only teachers, but writers, clergymen, etc.; (8) professional men, who devote themselves to matters essential to the interests of the community and thus not only save the time of the laborers, but often their property and their health, and their lives; (9) inventors and discoverers, who ascertain new conditions of more efficient production. These are the principal, though there are also others.

READINGS IN ART.

I.—SCULPTURE: ITS VARIETIES AND MATERIALS.

All work cut out in a solid material, in imitation of natural objects, is called sculpture. Thus carvings in wood, ivory-stone, marble, metal, and works moulded from wax and clay, come under the head of sculpture.

But sculpture, as we are about to consider it, is to be distinguished by the term *statuary* from all carved work belonging to ornamental art and glyptics. It must be borne in mind, however, that the sculptor does not ordinarily carve his work directly out of the marble; he first makes his statue, or bass relief, in clay or wax. This method enables him to "sketch in clay" and perfect his work in this obedient material. Michael Angelo, and many great masters could dispense with this and carve at once the statue from the block. The modeling in clay is, however, generally the primary work. The "model," as it is called, is afterward moulded, and by means of this mould a cast of the original clay statue, or bas-relief, is taken by the use of liquid plaster. The clay model is, therefore, like the original drawing of a painter—a master work.

The model completed, most of the carving is done by a skilled laborer, the sculptor taking it up to give the finish, which a master-hand alone can bestow. The copying of the model into marble is accomplished by means of a method of mechanical measurement, or "pointing." The model and the block of marble are both fastened to a base called a "scale-stone," to which a standard vertical rod can be attached at corresponding centers, having at its upper end a sliding needle, so adapted by a movable joint as to be set at any angle and fastened by a screw when so set. The master sculptor having marked the governing points with a pencil on the model the instrument is applied to these and the measure taken. The standard being then transferred to the block-base, the pointer, guided by his measure, cuts away the marble, taking care to leave it rather larger than the model, so that the general proportions are kept, and the more important work is then left for the master hand.

The character of work is influenced by the nature of the material in which the sculptor carves; the harder the stone the more difficult to give it the pliant forms of life. It is remarkable that the most ancient and perfect Egyptian statues should have been formed of very hard stones; and, as the ancient Egyptians were not acquainted with steel, they must have been dependent upon bronze, of various degrees of hardness, for their cutting tools. These works are remarkable for their excellence, both of form and proportion, and in the finish given to the details of feature, the dress, and the ornaments.

Assyrian sculpture was in softer stones, limestones and ala-

baster; only small objects, such as seals, being worked in hard stones.

Greek and Roman sculptors made many statues and bas-reliefs in hard stones, such as basalt, granite, and porphyry. The extreme difficulty of such work may be understood when it is seen that the ordinary method of the chisel and mallet, in the most skillful hands, would be quite unavailing in this hard material. The treadle-wheel, the drill, and the file, are brought to aid the chisel, and even these require the use of emery upon the wheel of the lapidary, in the manner in which the hardest stones are cut.

Clay modeled and dried in the sun, or hardened by the fire, was naturally one of the early forms in which sculpture was developed. At once ready to hand, and easily modeled, it was adopted for the same reasons that made clay convenient for the ordinary vessels of every-day use. We find countless numbers of these baked, or sun-dried clay figures. They have escaped destruction because of the little value of the material and because they resist decay. The Egyptians and Assyrians applied a vitreous glaze to terra-cotta objects, which made them more decorative and more durable.

Terra-cotta was chosen by many sculptors to preserve the spirit and freedom of the original. Although some shrinking under the action of the fire must be allowed for, yet what is well baked is certain to possess the excellence of the fresh clay. It escapes the chances of over-finish, which too often befalls marble and bronze.

Another form of sculpture to be noticed is called *chryselephantine*, on account of the combined use of gold and ivory; the nude parts of the figure being of ivory, probably with color applied to the features and the drapery of gold. The statue was substantially but roughly made in marble, with wood, perhaps, upon it; the ivory being laid on in thick pieces.

Statues of wood, of various kinds, were made by the most ancient sculptors. Many small figures in wood, the work of the Egyptian carvers, are to be seen in the museums, and the mummy cases show the practice of carving the head, while the trunk is left only partly shaped out of the block.

Bronze was one of the most important forms of ancient statuary. It must be remembered that bronze is an entirely different alloy from brass, the former being an alloy of copper and tin, while brass is of copper and zinc. Small proportions of gold, silver, lead, and iron, were mixed with the bronze by ancient metal-workers to give various colors to their work; thus a blush of shame was produced by allowing the iron in the bronze to rust. Plutarch mentions a face which was pale, the sculptor having mixed silver with the bronze.

The primitive bronze-workers, before they arrived at the knowledge of casting, began by hammering solid metals into shapes. The *toreutic* art, although not definitely known at present, was probably that of hammering, punching, and chiseling plates of metal, either separately or with a view of fixing them upon stone or wood. Both the solid hammered work and the hollow-plate work is mentioned by the authorities. The hollow statues were built up in pieces, fastened together with nails, rivets, and dove-tails, and it is not improbable that some system of welding was practiced.

The casting of metals in moulds must have followed the discovery that they could be melted. As the sculptor improved in his art of modeling he would be able to make better moulds. He would soon observe that the solid statue was not only very costly, but so very heavy that the whole figure would collapse from sheer weight.

This trouble was corrected by the discovery of a contrivance for casting metals in a hollow mould. It was done pretty much as it is at the present day, by fixing within the mould a *core*, which did not touch the sides, except at certain small points necessary for support. The space between this and the surface of the mould was to be filled by the molten metal.

There is still another method, less common in modern times, but employed by the ancients, for some of their smaller works. This is when a wax model is encased in clay or plaster of Paris and the molten metal then poured into it to melt the wax, and take the form of the work precisely as it left the hand of the sculptor. The original model is thus destroyed and the bronze takes its place. Some very large and important works have recently been cast in this method, but with the core. In bronze casting with a core, this contrivance must be made with great care. The mould, which is obliged to be formed of pieces fitted together, in order that the model may be taken out, is first well soaked in oil, then melted wax is applied to the inner side of the moulded parts in such thickness as may be required in the metal of the completed statue. But as a hollow metal statue would not be strong enough to support its own weight, a sort of skeleton of iron bars is made to take the general form of the figure, and this strong frame-work is firmly fixed within the mould. We have then the mould, with its wax lining, enclosing the iron skeleton, or *armature*, as it is called, with an opening left in the proper place to allow of pouring in the liquid plaster of Paris mixed with pounded brick, which fills the space about the armature. Therefore, if at this stage, the mould were taken to pieces again, the sculptor would behold his statue as one of apparently solid wax. Practically this is done in order that he may satisfy himself of the success of his work, and correct it where necessary. The model is then again placed in the mould preparatory to casting.

Galvano-plastique, or the use of electricity, to deposit a thin layer of metal in a pure state upon a model, is an important invention or application of science to art.

Having described the various materials and methods employed in sculptured art, we are ready to classify the different forms adopted and arrange them under the proper terms.

Sculpture in relief is the first division. There are four varieties. *Bas-relief*, or *basso-relievo*, is the term used when the work projects from the plain surface, the forms being rounded as in nature. If the work is very little raised, the forms being not so projecting as in nature, it is called *flat-relief*, or *stiacciato*. If more raised, but not free from the ground in any place, it is *half-relief*, or *mezzo-relievo*. If the relief is still higher it becomes *full-relief*, or *alto-relievo*, in which parts of the human figure are entirely free from the ground of the slab. In *sunk-relief*, or *cavo-relievo*, the work is recessed within an outline, but still raised in flat relief, not projecting above the surface of the slab. Much of the renaissance and modern sculpture combines the first-named kinds of work on different planes in degrees of distance, with some under-cutting. The beauty and character of bas-relief depend much upon the representation of outline.

Statuary proper is sculpture in the round. The statue is therefore seen on every side.

Statues are, (1) standing; (2) seated; (3) recumbent; (4) equestrian.

Statues are classed into five forms as to size: Colossal, above the heroic standard; heroic, above six feet but under the colossal; life-size; small life-size; statuettes, half the size of life and smaller.

To know the proper proportions of the figures is a matter of the utmost value in all sculpture, even more so than in painting, as the statue is measurable on every side and in every direction. It would have been impossible for the ancient Egyptians to carve out of the living rock their tremendous figures unless they had arrived at a rule of proportion for their figure. Without this their colossi would have been only rude monsters. Such a rule they had discovered and laid down in a canon, as it is called, similar to that which was followed by the Greek sculptors after them, and especially made known by Polyclethus, whose name it received. Though there is some doubt about the precise terms of the canon, there can be no doubt that it

had for its unit of measurement some part of the human figure. The version of Vitruvius Pollio is supposed to be the correct one. He says: "Nature has so composed the human body that the face, from the chin to the top of the forehead, and the roots of the hair, should be a tenth part; also the palm of the hand from the wrist-joint to the tip of the middle finger; the head from the chin to the highest point, an eighth; from the top of the chest to the roots of the hair, a sixth."

The rule of ten faces, or eight heads, derived from this, has remained to the present time. Several sculptors of a later period, who have given much attention to the subject of proportion, differ slightly from the canon of Polyclethus, though it is commonly accepted.

That strict rules of symmetrical proportion should be followed is necessary in all statuary, but especially in that which serves as a decoration for architecture. The knowledge of the figure acquired by eminent sculptors inspired them with admiration for the beautiful, and enabled them to express in the creation of their art an ideal of grand beauty, which was guided by a taste and feeling which rarely failed to direct them aright. It was the greatest sculptor of modern times, Michael Angelo, who said that the sculptor should carry "his compasses in his eye." Some one comments on this that, "Sculptors, and painters especially, dread the rule of geometry. They regard rule as a fetter upon their invention, not dreaming that this great man (Michael Angelo), before he expressed himself thus, had for so long a time had the compasses in his hand." This points to a profound truth in all practical art, that no man can be a great artist unless he have the power of drawing in the true proportions of the beautiful.

Having pointed out the leading points in the technic of sculpture, we take up its history, beginning naturally with the earliest forms as found in Egypt.

The Egyptians, inhabiting a flat, uniform country, of pure and salubrious climate, working as sculptors before a written language was invented, carved their colossal sphinx almost entirely out of the living rock; an amazing example of symbolic sculptural representation, combining the human with the brute form of the lion. The date of this first great work is probably earlier than that of the earliest pyramids—that built by Chofu, King of Memphis, the Cheops of Herodotus, and the larger one by Nef Chofu, his son. M. Renan, speaking for M. Mariette, states that a tablet was found by him recording that Nef Chofu did certain repairs to the sphinx; so that since it required repairs, it must already have existed for a considerable time. All small barbaric or archaic work of the ancient Egyptians in sculpture has perished in the vast lapse of time. But this one monument, raised at least 4,000 years before the Christian era, stands to prove, with its companion pyramids, the wonderful power of conception, the energy and practical skill which characterized the early Egyptians. What they lacked in ideas of beauty, they made up for by the simple grandeur in the colossal size and perfection in execution.

The intention of producing a monument to last forever was shown in an equally striking manner in the construction of the pyramids, and with an exercise of science and skill even more remarkable.

Egyptian art, in the form of architecture, was, after the pyramids of Ghizeh, further developed about 1650 B. C., under Osirtesen I., who built the oldest of the temples at Thebes. Columns and obelisks were then invented, and the *cavi relievi* were largely used. Statuary, however, did not advance until after the Phœnician Shepherd Kings—a body of wandering Arabs, so called, who conquered Upper Egypt for a time—were driven out by Amosis, King of Thebes, about 1450 B. C.

Passing over Amunothph I. and his successor Thothmosis I., of whom there is a fine statue in the Turin Museum, we come to Thothmosis II., whose reign marks a period of vast development, as he married Nitocris, the last Queen of Memphis, capital of Lower Egypt, and thus united the two kingdoms,

about 1340 B. C. The great avenue of sphinxes, leading to the temple of Karnak, was made in her reign, and there is a statue of Thothmosis II., a seated figure seven feet nine inches high, in good proportions, of about seven heads high, the fingers and toes straight, not showing the knuckles, and the legs sharply chiseled at the shins, not showing the small bone on the outside of the leg, as in the statues of the later time of Amunthoph III. (about 1260 B. C.).

The famous colossus, called the musical Memnon, one of the two still standing in the desert near Thebes, more than fifty feet high, is of this period. These statues are not in good proportion, being too short in the waist. The two fine lions, carved in red granite, belonging to this time, which Lord Prudhoe brought over and presented to the British Museum, are remarkable as examples of fine typical treatment of the lion. They show much grandeur of feeling, and, compared with the modern naturalistic sculpture of lions, they are superior as examples of monumental art.

In 1170 B. C. reigned Ramses II., the greatest of the Egyptian kings, under whom was invented all the wonderful adaptation of the lotus and papyrus plant to the design of columns, as seen in the famous colonnade of the hall of Karnak. His statue, in the Turin Museum, is in the finest style of ancient Theban art; it is a seated figure carved out of a block of black granite, and is not colossal, being only five feet seven inches high. The point to be noticed in this statue is the effort at action, which is not seen in earlier works. The right hand is raised to the breast holding the short sort of crosier of the god Osiris; the left hand resting on the knee, strongly clenched. The colossal statue of Ramses, as Osiris, may be taken as examples, with that of the Memnon, in the British Museum, of the sculpture of this time. The large sphinx in the Louvre bears the name of Ramses II. The four-seated colossi, carved out of the living rock at the entrance of the great temple of Abou Simbel in Ethiopia, represent the same king. They are between sixty and seventy feet high, and wonderfully well sculptured, but the proportions are not so good as in some smaller statues, as they are six heads only in height, and short in the waist and thick in the limbs, showing no attempt at any close or correct imitation of nature. They look straight before them with a calm smile of confident power and contentment. These statues, and others which are to be seen in the museums, are not equal to those of the time of Amunthoph III., previously referred to; they are not so well carved, and the features are heavy, with thick noses and lips, while the limbs are clumsy, and without any attempt at accurate modeling.

It will be observed, therefore, that Egyptian sculpture may be classed broadly into three styles. (1) the Egyptian proper, reaching its finest period in the reign of Amunthoph III; (2) the Ethiopic Egyptian; (3) the later Egyptian, leading to the decline of that style of sculpture. Of the first it should be noticed that the general proportions of the figure were more accurately considered than the relative proportions of hands and feet to the limbs, which are generally incorrect. There are, however, some examples of excellent proportion, as in a colossal arm and fist in the British Museum. This arm belonged to a statue of Thothmes III., and came from Memphis. It is about ten feet long. The fist also came from Memphis, and measures four feet across. The heads of statues of this period are of the pure Coptic type, with a nose somewhat aquiline, and the lips comparatively thin. The eyes, however, were always carved in full in profile representations; the feet, one in advance of the other on the same plane. The details of form at the knuckles and legs are well indicated.

In the Ethiopic-Egyptian statues, general proportion is lost sight of; the figures become dumpy, being only six heads high; the limbs are clumsy and wanting in modeling; the hands and feet stiff and not marked by details at the joints; nor do they show the small bone of the leg. The heads are more of the Negro type, with turned-up noses and thick lips.

In the later Egyptian it is remarkable that with more attempt to imitate nature in the modeling of the muscles, the forms of the trunk and limbs become unnaturally puffed. More is added in symbolic attributes; heads of the cat, the hawk, and the ape, are placed on the human body; the dress is more elaborate, that of the head especially, on which a disc for the sun was often placed, as on the god Osiris. From the fall of Thebes, about 1000 B. C., to the conquest of Egypt by the Persians, 523 B. C., sculpture became more and more degraded, and soon lost its original style of simplicity and grandeur of form.

After some two centuries of rule, the Persians were conquered by Alexander the Great, 332 B. C., but there are no statues of Greek style of this date found in Egypt; under the Ptolemies, his successors for 300 years, new temples of inferior but still Egyptian style were built, such as those at Philæ, Edfou, and Denderah, and many statues were made, but nearly all have been destroyed, and there is not one of any king or queen of the Ptolemies.

After Egypt became a Roman province, in 38 B. C., Egyptian sculpture, in a debased form, was still continued upon the decoration of the temples, but the statues were then in the hands of Greek artists. Still later, there is the well-known statue of Antinous as an Egyptian, the work of a Greek sculptor of the time of the Emperor Hadrian (A. D. 117-138).

Assyrian sculpture is a discovery of recent times, first made in 1842-3 by Botta, the French consul at Mosul on the banks of the Tigris, and almost simultaneously by Mr. Layard, who though he had seen the ruins of Nineveh in 1840 did not get permission to examine and excavate till 1845. The sculptures differ widely from any in Egypt in being nearly all in bas-relief and high relief. There are very few statues, carved in the round, that stand either with a support practically or on the legs. There are no colossi nearly approaching in size the Egyptian and Greek colossal statues, none being higher than eighteen feet, while as we have seen sixty feet was a moderate height for an Egyptian or Greek colossal figure, and some were higher. The colossal human-headed bulls and lions with wings, at the portals of the king's palace, are in high relief on huge slabs, one on each side, facing outwards, and one on each side on the wall, with the head turned to look to the front. It does not appear that any principal figure was set up in an interior, either of these compound animals, or of any deity or king. No colossal seated figures like the Egyptian statues have been found. The standing figures carved in relief differ entirely in the expression of the countenance and motive of the figure from the Egyptian. They have all some action; the king grasps a captured lion, or as chief priest he walks with his staff which he holds firmly, while the left hand rests on the hilt of his sword. It is true that the legs are on one plane, and the feet in a position that could not support the body; still the intention to show action and life is there. There is none of the desire to express majestic, calm, eternal repose and content which is so characteristic of Egyptian sculptured statues. Throughout the great number of slabs in the British Museum and in the Louvre there is a very vigorous descriptive power displayed in carving figures of men, horses, chariots, battles, sieges of cities, hunting scenes, processions, rivers with men swimming on inflated skins, with fish and boats; implements, weapons, chairs, baskets, trees, birds, buildings, with a close resemblance to the real objects that is very distinctive of the Assyrian style. The quadrupeds and birds are much better done than the human figures; the character of some of the mules is faithfully given, and there is much feeling for nature in some of the lions in the hunting-scenes. There is no doubt, also, that this naturalistic realism was carried further by painting the sculptures. In none of these painted reliefs, however, is there anything of the careful carving and delicate delineation of the Egyptian *cavi reliev*; they are all boldly done, and with a good deal of skill, but by hands that would seem to have been self-taught, and at liberty

to represent as they pleased so that the conventional attributes and symbolic objects were duly made clear. There is scarcely any regulated use of typical forms; and in the proportions of the figures especially there is no rule. The principal figures are about $6\frac{1}{2}$ heads high, and in others the heads are often larger, while the arms and legs are out of all proportion gigantic, the muscles being exaggerated into masses at the calf and knee, and the shin-bone absurdly prominent. All truth seems to have been sacrificed for the sake of conveying a violent look of immense strength. The battle scenes remind us of some of the puerile representations by mediæval workmen of a poor style, or the debased Roman work seen on sarcophaguses. The Assyrians, unlike the Egyptians, were "mighty hunters," consequently horses were favorites with the Assyrian carvers, as they were with the Greek sculptors afterwards; they seldom have more than one fore-leg and one hind one, but their heads are carefully carved, and all the trappings show the same intention to obtain exact resemblance as is displayed in the dress and ornaments of the kings and other figures. It is important to observe that these sculptures are very equal in merit; there is no sign of improvement and little of falling off. As to the date of these sculptures, they are much later than all the Egyptian work of the finer style.

It may be concluded that the Assyrian palaces, with their sculptured walls, took a much shorter time to build than the Egyptian, as they were built of sun-baked bricks, with ornamental slabs below, and wooden beams and columns above, all which structures have perished leaving only the stone slabs. The soft nature of the stone, which is a kind of grey alabaster, extremely suited to carving in the manner employed, afforded the facility that influenced the style and enabled the carvers to indulge their inclination for realistic detail. They do not appear to have sought for fine colored hard stones as the Egyptians did, nor do they show the same desire to make their work monumental and enduring.

Assyrian sculpture was always archaic, though at the same time more vigorous in what might be called graphic sculpture, and truer in imitation of nature than Egyptian, which rarely attempted action in the figure or facial expression. There is, however, no alliance between the two styles, and there was never likely to be, as the Assyrians were not a people of poetic and abstract ideas, but of facts, circumstances, and action. They thought of the present glory, and did not trouble themselves about the future. The same characteristics will partly account for the absence of any kind of reference to a future state. The tree of life with the priest ministering before it and holding fruit is to be seen; but it is remarkable that no sepulchral monuments have been found; no tomb or mark of regard in any shape for the welfare of the dead hereafter has been discovered.

Bearing in mind that the Assyrians were never a statue-making people, and never attempted to follow the example of the Egyptians—do we find them influencing the sculptural art of any other people in work like that of the Assyrians? This question is answered at once by the remains found at Persepolis, where there are to be seen similar winged and human-headed lions and bulls, and sculptured slabs, but no statues either in the round or in alto-relievo.

The ruins of the palaces of Cambyses, Darius, and Xerxes, the date of which is from 560 B. C. to the conquests of Alexander the Great (331 B. C.), show only sculptural remains left, after all the soft brick walls and the wooden beams and rafters have long perished. Persian sculptural art since those days never advanced to the dignity of statuary, but like its Assyrian predecessor stopped short where Greek art began to develop. The same is to be observed of that ramification of the Assyrian arts which is to be traced in the building of the temple of Jerusalem under Solomon, which, however, was some five centuries before the time of Cambyses, and about the same length of time after the settling of the Israelites in the Delta of the Nile

(1550 B. C.). The law of Moses was sufficient to prevent any sculpture in the likeness of living things; but the cherubim, with their wings, seem to have been borrowed from the Assyrians. The temple was, no doubt, built of stone and cedar-wood after the manner of the Assyrians, and with a profusion of ornament in carving, of valuable marbles, wood, and embossed work in precious metals.

The colossal sculptures in the rock-cut temples of India, whether taken as derived from the Assyrian centre or not, may be classed with that style as semi-barbaric and naturalistic, with a superadded symbolism which only led to the most extravagant deformities of the human figure to express the power and attributes of a deity. Statuary proper never existed in any shape of beauty like the human form, throughout Persia, India, and China, and there is no sign of any disposition amongst the Asiatics to learn the art from their European conquerors; it is not in their nature.

SELECTIONS FROM AMERICAN LITERATURE.

MODERN STATE OF ANCIENT COUNTRIES.

By GEORGE SANDYS.

The parts I speak of are the most renowned countries and kingdoms; once the seats of most glorious and triumphant empires; the theaters of valor and heroic actions; the soils enriched with all earthly felicities; the places where Nature hath produced her wonderful works; where arts and sciences have been invented and perfected; where wisdom, virtue, policy, and civility, have been planted, have flourished; and, lastly, where God himself did place his own commonwealth, gave laws and oracles, inspired his prophets, sent angels to converse with men; above all, where the Son of God descended to become man; where he honored the earth with his beautiful steps, wrought the works of our redemption, triumphed over death, and ascended into glory; which countries, once so glorious and famous for their happy estate, are now, through vice and ingratitude, become the most deplored spectacles of extreme misery; the wild beasts of mankind having broken in upon them, and rooted out all civility, and the pride of a stern and barbarous tyrant possessing the thrones of ancient and just dominion. Who, aiming only at the height of greatness and sensuality, hath in tract of time reduced so great and goodly a part of the world to that lamentable distress and servitude, under which (to the astonishment of the understanding beholders) it now faints and groaneth. Those rich lands at this present remain waste and overgrown with bushes, receptacles of wild beasts, of thieves, and murderers; large territories dispeopled or thinly inhabited; goodly cities made desolate; sumptuous buildings become ruins; glorious temples either subverted or prostituted to impiety; true religion discountenanced and oppressed; all nobility extinguished; no light of learning permitted, nor virtue cherished; violence and rapine insulting over all, and leaving no security except to an abject mind, and unlooked-on poverty; which calamities of theirs, so great and deserved, are to the rest of the world as threatening instructions. For assistance wherein, I have not only related what I saw of their present condition, but, so far as convenience might permit, presented a brief view of the former estates and first antiquities of those peoples and countries; thence to draw a right image of the frailty of man, the mutability of whatever is worldly, and assurance that, as there is nothing unchangeable saving God, so nothing stable but by his grace and protection.

THE DESIGN OF THE NEW ENGLAND PLANTATIONS.

By the REV. COTTON MATHER.

There were more than a few attempts of the English to people, to settle and improve the parts of New England which were to the northward of New Plymouth, but the designs of those

attempts being aimed no higher than the advancement of some worldly interests, a constant series of disasters confounded them, until there was a plantation erected on the nobler designs of Christianity, and that plantation, though it has had more adversaries, perhaps, than any one upon earth, yet, having obtained help from God, it continues to this day. There have been very fine settlements in the northeast regions, but what is become of them? I have heard that one of our ministers, once preaching to a congregation there, urged them to approve themselves a religious people from this consideration: that otherwise they would contradict the main object of planting this wilderness, whereupon a well-known person, then in the assembly, cried out: "Sir, you are mistaken, you think you are preaching to the people at the Bay; our main end was to catch fish." Truly 'twere to have been wished that something more excellent had been the main end of the settlements in that brave country, which we have, even long since the arrival of that more pious colony at the Bay, now seen dreadfully unsettled, no less than twice, at least, by the sword of the heathen, after they had been replenished by many hundreds of people who had thriven to many thousands of pounds, and all the force of the Bay, too, to assist them in maintaining their settlements. But the same or like inauspicious things attended many other endeavors to make plantations, on such a *main end*, in several other parts of the country, before the arrival of the Massachusetts colony, which was formed on more glorious aims.

REMARKS ON THE CATALOGUE OF PLANTATIONS.

(1) There are few towns to be now seen on our list but what were existing in this land before the dreadful Indian war which befell us twenty years ago; and there are few towns broken up within the then Massachusetts line by that war but what have revived out of their ashes. Nevertheless the many calamities which have ever since been wasting the country have so nipped the growth of it, that its later progress hath held no proportion with what was from the beginning; but yet with such variety that while the trained companies of some towns are no bigger than they were thirty or forty years ago, others are as big again.

(2) The calamities that have carried off the inhabitants of our several towns have not been all of one sort. Pestilential sicknesses have made fearful havoc in divers places, where the sound have not perhaps been enough to tend the sick, while others have not had one touch from the Angel of Death, and the sword hath cut off scores in sundry places, when others, it may be, have not lost a single man by that avenger.

(3) 'Tis no unusual, though no universal experiment, among us, that while an excellent, laborious, illuminating ministry has been continued in a town, the place has thriven to admiration; but ever since that man's time they have gone down the wind in all their interests. The gospel has evidently been the making of all our towns, and the blessings of the Upper have been accompanied with the blessings of the Nether Springs. Memorable also is the remark of Slingsby Beibel, Esq., in his most judicious "Book of the Interests of Europe:" "Were not the cold climate of New England supplied by good laws and discipline, the barrenness of the country would never have brought people to it, nor have advanced it in consideration and formidableness above the other English plantations exceeding it much in fertility and other inviting qualities."

(4) Well may New England lay claim to the name it wears, and to a room in the tenderest affections of its mother, the nappy island. For as there are few of our towns but what have their namesakes in England, so the reason why most of our towns are called what they are, is because the chief of the first inhabitants would thus bear up the names of the particular places there from whence they came.

(5) I have heard an aged saint, near his death, thus cheerfully express himself: "Well, I am going to heaven, and I will there tell the faithful who are gone long since from New-Eng-

land thither, that though they who gathered in our churches are all dead and gone, yet the churches are still alive, with as numerous flocks of Christians as were ever among them." Concerning most of the churches in our catalogue, the report thus carried unto heaven, I must now also send through the earth; but if with "as numerous," we could in every respect say as gracious, what joy to all the saints, both in heaven and on earth, might be from thence occasioned.—*Magnalia Christi Americana*.

EXTRACTS FROM "ESSAYS TO DO GOOD."

By the Rev. COTTON MATHER.

To take a poor child, especially an orphan left in poverty, and bestow a liberal education on it, is an admirable charity, yea, it may draw after it a long train of good, and may interest you in all the good done by him whom you have educated. Hence, also, what is done for schools, for colleges, and for hospitals is done for the general good. The endowment and maintenance of these is at once to do good to many.

But alas, how much of the silver and the gold is buried in hands where it is little better than if conveyed back to the mines whence it came. How much of it is employed to as little purpose as what arrives at Hindoostan, where a great part of it, after some circulation, is by the Moguls lodged in subterraneous caves never to see the light again. The Christian whose faith and hope are genuine, acts not thus.

Sometimes elaborate compositions may be prepared for the press, works of great bulk, and of greater worth, by which the best interests of knowledge and virtue might be considerably promoted, but they lie, like the impotent man at the pool of Bethesda, in silent neglect, and are likely to continue in that state, till God inspires some wealthy persons nobly to subscribe to their publication, and by this generous application of their property to bring them abroad. The names of such noble benefactors to mankind ought to live as long as the works themselves live; and when the works do any good, what these have done towards the publishing of them, ought to be "told for a memorial of them." He urges gentlemen of leisure to seek "some honorable and agreeable employments," and says, "I will mention one: The Pythagoreans forbade men's eating their own brains, or keeping their good thoughts to themselves." The incomparable Boyle observes that as to religious books in general, "those that have been written by laymen, and especially by gentlemen, have (*cæteris paribus*) been better received and more effectual than those published by clergymen." Mr. Boyle's were certainly so. Men of quality have frequently attained such accomplishments in languages and science that they become prodigies of literature. Their libraries also have stupendous collections approaching toward Vatican or Bodleian dimensions. It were much to be wished that persons of wealth and station would qualify themselves for the use of the pen, as well as of the sword, and deserve this eulogium: "They have written excellent things." An English person of quality in his treatise entitled "A view of the soul," has the following passage: "It is certainly the highest dignity, if not the greatest happiness of which human nature is capable in the vale below, to have the soul so far enlightened as to become a mirror, conduit or conveyor of God's truth to others." It is a bad motto for a man of capacity to say, "My understanding is unfruitful." Gentlemen, consider what subjects may most properly and usefully fall under your cultivation. Your pens may stab atheism and vice more effectually than other men's can. If out of your tribe there come those who handle the pen of the writer, they will do uncommon execution. One of them has ingenuously said, "Though I know of some *functions*, yet I know no *truths* of religion that like the shew-bread belong to the priests alone." * * *

To do good is a sure and pleasant way effectually to bespeak God's blessings on ourselves. Who so likely to find blessings as the men who are blessings? While we work for God,

he certainly will work for us, and ours—will do for us more than we have done for him; "more than we can ask or think." A good action is its own reward.

But what shall be done for the good man in the heavenly world? His part and work in the city of God are at present incomprehensible to us, but the kindness which his God will show him in the strong city will be truly marvelous. The attempts which the Christian has made to fill this world with righteous things, are so many tokens for good to him, that he shall have a portion in that world wherein shall dwell nothing but righteousness. He will be welcomed with "Well done, good and faithful servant."

I will conclude with a declaration which I will boldly maintain. It is this: Were a man able to write in seven languages, could he daily converse with all the sweets of the liberal sciences to which the most accomplished make pretensions; were he to entertain himself with all ancient and modern history; and could he feast continually on the curiosities which the different branches of learning may discover to him, all this would not afford the ravishing satisfaction which he might find in relieving the distresses of a poor, miserable neighbor, nor would it bear any comparison with the heartfelt delight which he might have by doing service to the kingdom of our great Savior in the world.

SPIRITUAL KNOWLEDGE.

By JONATHAN EDWARDS.

There is a kind of taste of the mind, whereby persons are guided in their judgment of the natural beauty, gracefulness, propriety, nobleness, and sublimity of speeches and action, whereby they judge, as it were, by the glance of the eye, or by inward sensation, and the first impression of the object; so there is likewise such a thing as a divine taste, given and maintained by the Spirit of God, in the hearts of the saints, whereby they are in like manner led and guided in discerning and distinguishing the true spiritual and holy beauty of actions; and that more easily, readily, and accurately, as they have more or less of the Spirit of God dwelling in them. And thus "the sons of God are led by the Spirit of God, in their behavior in the world."

A holy disposition and spiritual taste, where grace is strong and lively, will enable a soul to determine what actions are right and becoming Christians, not only more speedily, but far more exactly, than the greatest abilities without it. This may be illustrated by the manner in which some habits of mind, and dispositions of heart, of a nature inferior to true grace, will teach and guide a man in his actions. As for instance, if a man be a very good natured man, his good nature will teach him how to act benevolently amongst mankind, and will direct him, on every occasion, to those speeches and actions which are agreeable to rules of goodness, than the strongest reason will a man of a morose temper. So if a man's heart be under the influence of an entire friendship, and most endeared affection to another, though he be a man of an indifferent capacity, yet this habit of his mind will direct him, far more readily and exactly, to a speech and deportment, or manner of behavior, which shall in all respects be sweet and kind, and agreeable to a benevolent disposition of heart, than the greatest capacity without it. He has, as it were, a spirit within him, that guides him; the habit of his mind is attended with a taste by which he immediately relishes that air and mien which is benevolent, and disrelishes the contrary, and causes him to distinguish between one and the other in a moment, more precisely, than the most accurate reasonings can find out in many hours. As the nature and inward tendency of a stone, or other heavy body, that is let fall from aloft, shows the way to the center of the earth more exactly in an instant than the ablest mathematician, without it, could determine, by his most accurate observations, in a whole day. Thus it is that a spiritual disposition and taste teaches and guides a man in his behavior in the world. So an em-

inently humble, or meek, or charitable disposition, will direct a person of mean capacity to such a behavior, as is agreeable to Christian rules of humility, meekness and charity, far more readily and precisely than the most diligent study and elaborate reasonings of a man of the strongest faculties, who has not a Christian spirit within him. So also will a spirit of love to God, and holy fear and reverence toward God, and filial confidence in God, and an heavenly disposition, teach and guide a man in his behavior.

It is an exceedingly difficult thing for a wicked man, destitute of Christian principles in his heart to guide him, to know how to demean himself like a Christian, with the life and beauty, and heavenly sweetness of a truly holy, humble, Christ-like behavior. He knows not how to put on these garments; neither do they fit him.

The saints in thus judging of actions by a spiritual taste, have not a particular recourse to express rules of God's word, with respect to every word and action that is before them, the good or evil of which they thus judge: But yet their taste itself, in general, is subject to the rule of God's word, and must be tried by that, and a right reasoning upon it. As a man of a rectified palate judges of particular morsels by his taste; but yet his palate itself must be judged of, whether it be right or no, by certain rules and reasons. But a spiritual taste of soul mightily helps the soul in its reasonings on the word of God, and in judging the true meaning of its rules: As it removes the prejudices of a depraved appetite, and naturally leads the thoughts in the right channel, casts a light on the word of God, and causes the true meaning, most naturally, to come to mind, through the harmony there is between the disposition and relish of a sanctified soul, and the true meaning of the rules of God's word. Yea, this harmony tends to bring the texts themselves to mind, on proper occasions; as the particular state of the stomach and palate tends to bring particular meats and drinks to mind, as are agreeable to that state. "Thus the children of God are led by the Spirit of God" in judging of actions themselves, and in their meditations upon, and judging of, and applying the rules of God's holy word: And so God "teaches them his statutes and causes them to understand the way of his precepts;" which the Psalmist so often prays for.

But this leading of the spirit is a thing exceedingly diverse from that which some call so; which consists not in teaching them God's statutes and precepts, that he has already given; but in giving them new precepts by immediate inward speech or suggestion, and has in it no tasting the true excellency of things, or judging or discerning the nature of things at all. They do not determine what is the will of God by any taste or relish, or any manner of judging of the nature of things, but by an immediate dictate concerning the thing to be done; there is no such thing as judgment or wisdom in the case. Whereas, in that leading of the spirit which is peculiar to God's children, is imparted that true wisdom and holy discretion, so often spoken of in the word of God; which is high above the other way, as the stars are higher than a glow worm; and that which Balaam and Saul (who sometimes were led by the spirit in that other way) never had, and no natural man can have without a change of nature.

[End of Required Reading for October, 1883.]

MAN is only a reed, the weakest plant of nature, but he is a thinking reed. It is not necessary that the whole universe should be in arms to crush him. A vapor, a drop of water is sufficient to put him out of existence. But even though the universe could crush him to atoms, man would still be more noble than that which kills him, because he is conscious that he is dying, and of the advantage which the universe has over him; the universe knows nothing.—*Pascal.*

NOTHING is so dangerous as an ignorant friend; a wise enemy is worth much more.—*La Fontaine.*

WHERE LIES THE MUSIC?

By ALICE C. JENNINGS.

["When Paganini once rose to amuse a crowded auditory with his music, he found that his violin had been removed, and a coarser instrument substituted for it. Explaining the trick, he said to the audience, "Now I will show you that the music is not in my violin, but in me."—CHAUTAQUAN for December, 1882.]

An artist once, whose magic could command
That sound its deepest secrets should unfold,
Had found his instrument by evil hand
Exchanged for one of meaner, coarser mould.

Yet, like the clashing tongue of vibrant bells,
The hindrance but a greater power revealed.
"See, I will show thee that the music dwells
In *me*, and not the instrument I wield."

He turns, and sweetly, grandly, at his call,
The violin its richest music flings.
The instrument is naught—the player all—
The power is in the touch, and not the strings.

A coarse, rude instrument, this world, at best:
Its strings made tense by selfishness and pride;
If by its discords music be expressed,
The music in our fingers must reside.

Remember this: in tune keep heart and hand,
And to earth's music thou shalt hold the key,
And from its discords sweetest tones command,
Unknown and unimagined, save by thee.

WAVERLEY NOVELS.

By WALLACE BRUCE.

When Walter Scott, one morning before breakfast, while looking for fishing-tackle, came upon his long neglected manuscript of Waverley, and decided to publish it, he baited his hook, so to speak, with a plump literary angle-worm, and carefully concealing himself, dropped it cautiously into one of the quiet and almost stagnant pools which here and there break the flow of the eighteenth century.

Not to carry the figure further he wakes up one morning to find the "Author of Waverley" famous; but no one knew *who* the "Author of Waverley" was. Romances, relating alike to the history of Scotland, England, France, Switzerland and Palestine, covering a wide range of life and character, with a varied record of eight hundred years, followed each other so rapidly that the reading world opened its eyes in wonder, until the "great unknown" was finally regarded the "great magician." His books, as they came wet from the press, were literally devoured by the story-loving people of England and Scotland, and packages, shipped across the Atlantic, were regarded the most valuable part of the cargo. I have heard elderly people of New England speak of anxiously waiting for the next ship which was to bring to their hands a new novel by the "Author of Waverley." Never before had the pen of any man awakened such responsive interest in his own generation. The publication of Waverley marked a new era in romantic literature.

During the eighty years that have followed that publication mankind has had its hopes, longings, ambitions and jealousies mirrored in works of fiction. Hundreds, ay, thousands of novels—most of them unworthy of their high lineage—have contended with each other for the world's approbation; writers without number have flooded the century with romance; but through all these years Walter Scott stands the acknowledged

master, the purest-hearted, the noblest-minded of them all; the man who could say upon his death-bed: "I have not written one line which I would wish blotted."

No words of re-invitation are necessary to those who have once read the pages of Sir Walter, but it will be a "consummation devoutly to be wished" if I can turn the coming generation of your readers away from the sickly sentiment of the day to the works of him, whose influence, like that of King Arthur of the Round Table, inspires the soul with

"High thoughts and amiable words,
And courtliness, and the desire of fame,
And love of truth, and all that makes a man."

Some years ago, while preparing a lecture on "The Landmarks of Scott," I found myself confronted with twenty-six novels and five well-known poems, besides innumerable essays and histories, all demanding at least a passing word. I saw that two minutes devoted to each would more than fill my lecture hour, and leave no room for the frame-work, viz: Loch Katrine, Loch Lomond, the Trosachs, Melrose, Edinboro, the Yarrow, the Ettrick, the Tweed, and the Border Country, where the Percy and the Douglas fought. It then occurred to me that Scott had unconsciously prepared a panoramic history of Europe from the time of the Crusades to the year 1812. Acting upon this suggestion I examined the novels and poems and found to my great delight, that with here and there an absent link of fifty or a hundred years the chain was almost perfect. I condensed the prominent features of eight hundred years, tracing their connection with Scott's graphic pictures into a pen-sketch of ten minutes, and I have been gratified to see that this idea of chronological order has been recently followed by one of the leading New York publishers. It is my object in a series of articles to elaborate this historical sequence from the time of "Count Robert of Paris" (1094) down to "St. Ronan's Well" (1812), and to point out in passing some of the beauties of the great author.

If the reader of these articles will follow with me the romances to which I refer, I think he will say, at the close of the series, that he has found in the Waverley Novels a vivid picture of the events and customs of Europe, from the days of the crusades down to a time within the memory of men still living. M. Augustin Thierry, one of the most philosophical essayists of France, has eloquently said: "There are scenes of such simplicity, of such living truth, to be found, that notwithstanding the distance of the period in which the author places himself, they can be realized without effort. It is because in the midst of the world which no longer exists, Walter Scott always places the world which does, and always will exist; that is to say, human nature, of which he knows all the secrets. Everything peculiar to the time and place, the exterior of men, and aspect of the country and of the habitations, costumes and manners, are described with the most minute truthfulness; and yet the immense erudition, which has furnished so many details, is nowhere to be perceived. Walter Scott seems to have for the past that second sight, which, in times of ignorance, men attributed to themselves for the future. To say that there is more real history in his novels on Scotland and England than in the philosophically false compilations, which still possess that great name, is not advancing anything strange in the eyes of those who have read and understood "Old Mortality," "Waverley," "Rob Roy," the "Fortunes of Nigel," and the "Heart of Mid Lothian."

Allison says in his essay on Chateaubriand, published in *Blackwood's Magazine*, March, 1832: "We feel in Scott's characters that it is not romance, but real life which is represented. Every word that is said, especially in the Scotch novels, is nature itself. Homer, Cervantes, Shakspeare, and Scott, alone have penetrated to the deep substratum of character, which, however disguised by the varieties of climate and government, is at bottom everywhere the same; and thence they have found a

responsive echo in every human heart. He has carried romance out of the region of imagination and sensibility into the walks of actual life. He has combined historical accuracy and romantic adventure with the interest of tragic events; we live with the heroes, and princes, and paladins of former times, as with our own contemporaries; and acquire from the splendid coloring of his pencil such a vivid conception of the manners and pomp of the feudal ages, that we confound them, in our recollections, with the scenes which we ourselves have witnessed. The splendor of their tournaments, the magnificence of their dress, the glancing of their arms, their haughty manners, daring courage, and knightly courtesy; the shock of their battle-steeds, the splintering of their lances, the conflagration of their castles, are brought before our eyes in such vivid colors, that we are at once transported to the age of Richard and Saladin, of Charles the Bold and Philip Augustus."

The four novels, which deal with the history of the Crusades, are "Count Robert of Paris," "The Betrothed," "The Talisman," and "Ivanhoe." It is a singular fact that the one occupying the first place in chronological order was written last, and hardly completed by the author when he died. "Ivanhoe" is, without doubt, the great favorite. I have often thought that "Ivanhoe" bears the same relation to Scott's novels that "The Merchant of Venice" does to the dramas of Shakspeare. "Old Mortality," and "Hamlet," may show deeper insight; but neither Scott nor Shakspeare ever surpassed the two I have associated in dramatic interest. The three novels which precede "Ivanhoe" in point of time will give us a complete knowledge of the times and manners of the Crusades, and lead us, as it were, from one picture-gallery to another, until we come to the master-piece of the great artist.

"Count Robert of Paris" opens with a description of the court of Alexius Comnenus—a wily monarch, who had ample need of all his strategy in dealing with foes that menaced him from every side: the Franks from the west, the Turks from the east, the Scythians from the north, the Saracens from the south. The wealthy city on the Bosphorous, enriched by the spoils of nations, whose golden gate symbolized the wealth and magnificence of seven hundred years of prosperity, was on the great highway of travel, where, so to speak, the "cross-roads" of Europe met, and presented a tempting prize to the restless and barbarous hordes from the shores of the Caspian to the German Ocean. "The superb successor of the earth's mistress," decked in borrowed splendor, gave early intimations of that speedy decay to which the whole civilized world, then limited within the Roman Empire, was internally and imperceptibly tending. Intrigue and corruption in the palace had compelled the Greek sovereigns of Constantinople, for many years, to procure foreign soldiers to quell insurrections and defend any traitorous attempt on the imperial person. These were known as Verangians—a word signifying barbarians—and formed a corps of satellites more distinguished for valor than the famed Prætorian Bands of Rome.

The second chapter of the book reveals the hatred and jealousy existing between these foreign soldiers and the crafty civilians. The Verangian, to whom the reader is introduced, is an Anglo-Saxon too proud to bow his head to a Norman conqueror, a wanderer from his father-land, a soldier in search of better fortune, soon to discover by lucky chance among the crusaders the fair Bertha of his early love. Upon this slender thread the novelist hangs the romantic elements of the story. But Count Robert of Paris is in no sense a love drama; in fact it can hardly be termed a romance. It is rather a historic sketch, placing in sharp contrast the wild enthusiasm of western Europe, her castles of rude masonry, her mud hovels, her rude simplicity, with the over-refined manners and tapestried chambers of the eastern court hastening to its decay. It is living Europe confronting the dead centuries.

The third chapter introduces us to a richly furnished drawing room, where the Princess Anna Commena—the first lady his-

torian—sits reading to a sleepy group her prolix history of the glory of her father's reign. At this gathering Scott brings together with great art all the leading actors of the drama; the Emperor Alexius and his wife Irene; Nicephorous Briennius, the intriguing son-in-law, husband of the fair historian; the crafty philosopher Agelastes; Achilles Tatius, master of the guards, and the faithful Verangian. This is the real commencement of the story, and to this gathering the news is announced of another body of the great Crusade, consisting not of the ignorant or of the fanatical like those led on by Peter the Hermit, but an army of lords and nobles marshaled by kings and emperors. Against this mass of steel-clad warriors the East had no power to oppose save the inherent cunning and strategy of Comnenus. Craft and wealth meet stupidity and avarice. The more powerful chiefs of the Crusades are loaded with presents, feasted by the emperor with the richest delicacies, and their thirst slaked with iced wine; while their followers are left at a distance in malarial districts, and intentionally supplied with adulterated flour, tainted provisions, and bad water. Neglected by friends and insulted by foes, they contracted diseases and died in great numbers "without having once seen a foot of the Holy Land, for the recovery of which they had abandoned their peace, their competence, and their native country. Their misfortunes were imputed to their own wilfulness, and their sickness to the vehemence of their own appetites for raw fruits and unripened wines." By promises of wealth and long-practiced arts of diplomacy, the Emperor Comnenus at last even induces the leaders of the crusade individually to acknowledge him—the Grecian Emperor—originally lord paramount of all these regions, as their liege lord and suzerain.

Scott takes advantage of this historical fact to draw one of his matchless pictures, which in color and incident rivals the best pages of his more dramatic romances; and it is here that Count Robert, when the emperor left his throne for a single moment, dismounted from his horse, took the seat of royal purple, and indolently began to caress a large wolf-hound, which had followed him, and which, feeling as much at ease as his master, reposed its grim form on the carpets of gold and silk damask which tapestried the imperial footstool. It was a picture of modern liberty looking worn-out despotism in the face. That sublime audacity revealed the mettle of the race which was to make individual conscience supreme; and his haughty and fearless speech was the prologue of Magna Charta, the Bill of Rights, and the Declaration of Independence. We must pass over the meeting in the garden of Agesilaus, the entertainment at the palace, the drugged cup, the dungeon experience of the count, and his miraculous release, the fortitude and virtue of his Countess Brenhilda, the meeting of the Verangian with Bertha in the garden of the philosopher, the treachery of Briennius, his imprisonment and death-decree, and many other incidents of interest, for the remaining space of this article must be given to a brief consideration of "The Betrothed;" but the reader will be happy to know that, after the conquest of Jerusalem, Count Robert of Paris returned to Constantinople *en route* to his native kingdom. Upon reaching Italy the marriage of the Verangian and Bertha was celebrated in princely style; and on his return to England a large district, adjacent to the New Forest, near the home of his ancestors, was conferred upon him by William Rufus, where it is presumed they spent their declining years in peace and happiness.

"The Betrothed" opens with the year 1187—the time of the Third Crusade—when Baldwin, Archbishop of Canterbury, preached the crusade from castle to castle, from town to town, awaking the inmost valleys of his native Cambria with the call to arms for the recovery of the Holy Sepulcher. As a connecting link between the stories we will say that the soldiers of the First Crusade, after years of hardship and suffering, at last accomplished their vows. Antioch and Jerusalem yielded to their arms, the Holy Sepulcher was redeemed from infidels.

Those who returned to their homes recounted their triumphs and all Europe was aglow with new zeal. Forty-five years later, in the year 1142, a Second Crusade was organized against the impending dangers which threatened Palestine and Jerusalem. The warlike West was again in arms; but this crusade was more unfortunate than the first. The crusaders were again compelled to endure the outrages and perfidies of the Greek. As in the First Crusade, the Christian armies dragged in their train a great number of children, women, and old men, who could do nothing toward victory but greatly augmented the disaster of defeat. The piety and heroism of the First Crusade had degenerated into a love of show and military splendor. "That which was still more injurious to discipline," to quote from the admirable "History of the Crusades," by J. F. Michaud, "was the depravity of manners in the Christian army, which must be principally attributed to the great number of women that had taken arms and mixed in the ranks of the soldiery. In this crusade there was a troop of Amazons, commanded by a general, whose dress was much more admired than her courage," and whose gilded boots procured her a name which we will not copy from the historian's pages. Forty years of struggle pass away in Palestine, and at the time of the opening of our story Henry the Second of England, Richard the First, and Philip of France, determine on renewing the Holy War. Moved by the eloquence and enthusiasm of Baldwin, there is a general cessation of hostilities between the Welsh princes and their warlike neighbors on the Marches of England. But one castle, known as the Garde Doloureuse, was not so fortunate. Its owner was Raymond Berenger. The hand of his daughter was asked in marriage by one of the Welsh chieftains. The compliment was declined. Raymond Berenger, in accordance with a rash promise, gave battle upon the plain and was slain. The castle was assaulted, but faithfully defended by an honest Fleming, inspired by the heroism of the orphaned daughter. Before the battle, Scott gives us a fine picture of the Welsh bards, and an admirable idea of life in the mountain fastnesses of Wales. His description of the defense of the castle is so graphic that we seem to walk the ramparts with the soldiers, and listen to the counsel of its defenders. Hugo De Lacy, Constable of Chester, arrives in time to raise the siege of the castle, and at once lays siege to the heart of the fair Eveline, to whom it seems she had been promised, when a child, by her father. From a sense of duty, rather than love, she accepts his proposal. She visits her Saxon aunt—a cruel and demented relic of the house of Baldringham; and is compelled to sleep in a haunted chamber, known as the "Room of the Red Finger." The picture of Saxon life here presented is in strong contrast with the life of the Norman nobles. The century that had followed the Norman invasion of England had irritated wounded pride. Overcome by superstition and terror, Eveline sees in her dreams the spectre, and hears the fatal couplet, which gives name to the romance:

"Widowed wife and married maid,
Betrothed, betrayer, and betrayed."

Eveline goes from her aunt's to the abbess of a convent, a near relative, and Hugo De Lacy, having signified his intention of going to the Holy Land, asks a remission of his vow for two years; but the rigid prelate Baldwin was inexorable: "The advancement of the crusade was the chief business of Baldwin's life, and the liberation of the Holy Sepulcher from the infidels was the unfeigned object of all his exertions. The successor of the celebrated Becket had neither the extensive views, nor the aspiring spirit of that redoubted personage; but on the other hand, saint as the latter had become, it may be questioned whether, in his professions for the weal of christendom, he was half so sincere as was the present archbishop."

The interview between De Lacy and Baldwin shows the great power of the Church in the eleventh and twelfth centuries. He was compelled to leave Eveline before wedlock had united them indissolubly, and the first line of the couplet:

"Widowed wife and married maid," seemed already in the course of fulfillment. Hugo de Lacy sets sail for Palestine with these good-by words: "If I appear not when three years are elapsed let the Lady Eveline conclude that the grave holds De Lacy, and seek out for her mate some happier man. She can not find one more grateful, though there are many who better deserve her."

Eveline returns to the castle of her father; the care of the country against Welsh invasion is assigned to Damian de Lacy, who had already by acts of bravery won the esteem of Eveline. The days and months of indolent castle life wear slowly away, with the occasional visit of a strolling harper, or a hawking expedition near the castle, which Scott, with his love for outdoor amusements, enters into with apparent relish. On one of these excursions Eveline is made prisoner by a party of Welsh soldiers, and she is led away blindfolded through the recesses of the hills. She is rescued by Damian de Lacy, who however is seriously wounded, and taken against the advice of friends to the castle. Unfounded rumors poison the minds of the people, the castle is attacked by the king's forces, led on by a traitor of Hugo's family. Damian is taken prisoner and condemned to death. More than three years had passed away, and now Hugo returns in poverty, and completely broken in spirit. Damian is released, and Hugo waives his claim to the hand of Eveline, and Damian wins one of the noblest women that Scott has made immortal in the world. So much for the brief outline of the story, which reveals the manner of life on the Welsh borders during the time of the Third Crusade. The two novels which follow, "The Talisman" and "Ivanhoe," portray even in more vivid colors the sufferings of the crusaders in Palestine, and the every day life of Merrie England.

THE IVY.

By HENRY BURTON.

Pushing the clods of earth aside,
Leaving the dark where foul things hide,
Spreading its leaves to the summer sun,
Bondage ended, freedom won;
So, my soul, like the ivy be,
Rise, for the sunshine calls for thee!

Climbing up as the seasons go,
Looking down upon things below,
Twining itself in the branches high,
As if the frail thing owned the sky;
So, my soul, like the ivy be,
Heaven, not earth, is the place for thee.

Wrapping itself round the giant oak,
Hiding itself from the tempest's stroke;
Strong and brave is the fragile thing,
For it knows one secret, how to cling:
So, my soul, there's strength for thee,
Hear the Mighty One, "Lean on me!"

Green are its leaves when the world is white,
For the ivy sings through the frosty night;
Keeping the hearts of oak awake,
Till the flowers shall bloom and the spring shall break;
So, my soul, through the winter's rain,
Sing the sunshine back again.

Opening its green and fluttering breast,
Giving the timid birds a nest;
Coming out from the winter wild,
To make a wreath for the Holy Child;
So let my life like the ivy be,
A help to man and a wreath for Thee!

—Good Words.

C. L. S. C. COMMENCEMENT.*

CLASS OF 1883.

A special dispensation of weather seemed to have been prepared for the accommodation of the second graduating class of the Chautauqua Literary and Scientific Circle on Saturday. A bright warm day was benevolently shaded and cooled by nature's great sunshade of cloud during all the out-door exercises, and promptly upon the entry of the multitude under the cover of the Amphitheater it began to rain to still further cool the air. Everything was opportune, and the surroundings faultless.

The management terrestrial was equally good. There were four different processions, in five divisions, moving from different rendezvous in the grounds and converging and articulating with each other. Each of them started on time "to a tick," got to and dropped into place, and everything moved with the smoothness and precision of a well-adjusted machine. The program, as prepared, was carried out to the letter and second.

The attendance was as immense, the feeling as good as the day and management. The unprecedented crowd of the night before was augmented in the morning by boat-loads and train-loads, and when the signal-bells for beginning the day's movement sounded the avenues were thronged.

Punctually at the hour the "Guard of the Gate," H. S. Field, J. J. Covert, Miss E. E. Tuttle, W. H. Rogers, Charles B. Wood, S. J. M. Eaton, Miss Myrtle Hudson, A. M. Martin, J. G. Allen, A. M. Mattison, and the "Guard of the Grove," Miss Annie E. Wilcox, A. Wilder, Miss M. F. Wells, Miss E. Irvin, Miss Eleanor O'Connell, E. C. Norton, Mrs. E. Howe, De Forest Temple, Mrs. Isaiah Golding, George Seebrick, in charge of Marshal S. J. M. Eaton, formed at the cottage of Lewis Miller (Auditorium), the right resting on Hedding Avenue.

The keys of the Golden Gate having been delivered by President Miller to the Messenger, Rev. A. H. Gillet, the division marched up Hedding Avenue to Clark, and out Clark to the Hall of Philosophy, and were distributed to their proper positions in charge of the inclosure of St. Paul's Grove.

The second division, consisting of fifty-two little girls, the youngest, Jennie Templeton, four years of age, heading the procession, beautifully garlanded and bearing artistic baskets laden with flowers to their very brim, conducted by Mrs. Frank Beard, superintendent, assisted by Miss M. E. Bemis, Miss Minnie Barney, Messrs. Garret E. Ryckman, and W. H. Burroughs, and Miss Blanche Shove, was formed at the Children's Temple, the right resting on Clark Avenue. The "Society of the Hall in the Grove," (the graduates of the class of 1882, C. L. S. C.) were thus escorted by this beautiful company of prospective Chautauquans through Clark Avenue to Hedding, down Hedding to Simpson, through Simpson to Park Athenæum, through Park Athenæum to Lake Avenue, to Dr. Vincent's cottage.

The sixth division, consisting of the graduates of the class of 1883, and the graduates of the class of 1882, who had not last year passed through the Golden Gate, and under the Arches, met at the gate of St. Paul's Grove, on Merrill Avenue, each provided with a ticket, a garnet badge, and a copy of the commencement service. A portion of the Guard of the Grove stood within the gate, and a portion stood in waiting without. The Messenger stood at the portal, holding the keys of the gate. The Guard of the Gate took their places in order, near the Messenger, while the leaders of the graduating class, Rev. H. C. Farrar, chairman, and Rev. George C. Wilding, took their stations, one on the right and the other on the left of the gateway, that at a given signal the class might read responsively the form of service provided. The classes were arranged in parallel columns stretching from the portal itself to the middle of Miller Avenue, a block and a half.

At precisely 9:45 the Chautauqua Band, headed by Frank Wright, Marshal, marching up Lake Avenue, reached the cottage of Dr. Vincent. Here the banner of the C. L. S. C., with the "Guard of the Banner," Mrs. M. Bailey and Mrs. Delos Hatch, were escorted to their places in the line. Four little children, Chippie Firestone, Edna McClellan, Nellie Mallory and Bobbie Davenport were conducted to their places as "streamer bearers," while the beautiful fabric itself was borne by Mr. W. E. H. Massey and Mr. Will Butler. The Superintendent of Instruction, Dr. Vincent, took his place in the line.

The procession took its order of march, moving through Lake Avenue to Haven Avenue, and up Haven to the Hall of Philosophy, which it entered, and the band departed to escort thither "The Chautauqua Procession." (Division V.) This division formed at the Hotel Athenæum, Frank Wright, Marshal, the right resting on the north main front of the hotel, in the following order:

Band.

Chautauqua Board of Trustees, led by Lewis Miller, Esq., President.
The Faculty and Students of the "Chautauqua School of Languages,"
J. H. Worman, Marshal.

The Normal Alumni, carrying their banners for the various years since 1874, Frank Beard, Marshal.

The members of the classes of the C. L. S. C. for the years 1887, 1886, 1885, 1884, Mr. Copeland, Marshal.

The guests of the Assembly, Rev. Frank Russell, Marshal.

The procession, thus constituted, moved at ten o'clock from the piazza of the Hotel Athenæum, across the north side of the Park Athenæum, to Lake Avenue, out Lake Avenue to Cookman Avenue, up Cookman to Clark, halting on Cookman, the right resting on Clark, in open order, the Hall of Philosophy being on its right flank.

At this time the entire neighborhood of the "Hall in the Grove" was filled with interested crowds of spectators, whose eyes saw for the second time the "Recognition Services" of the immense class in the "People's University."

More than a hundred and fifty of the "Society of the Hall in the Grove" (graduates of the preceding year), entered the Hall, and were seated in its western side.

Precisely at ten o'clock, as the booming of the great bell at the Point indicated the hour, the members of the Class of 1883, with such members of the Class of 1882 as had not last year passed the Arches, standing at the gate of St. Paul's Grove, read responsively the devotional services, Rev. George C. Wilding acting as precentor of the first section, and Rev. H. C. Farrar as the precentor of the second section.

The "Messenger," Rev. A. H. Gillet, in slow and solemn utterance gave the announcement as follows:

I come to inform all candidates for enrollment in the "Society of the Hall in the Grove" that the hour appointed for your reception has arrived; the Hall has been set in order; the Path through the Grove has been opened; the Arches under which you must pass have been erected; the Key which will open this Gate has been placed in my hands. And to you who, as members of the CHAUTAUQUA LITERARY AND SCIENTIFIC CIRCLE, have completed the four years' Course of Reading, and now hold in your hands a pledge of the same, I extend, in the name of the authorities, a welcome into St. Paul's Grove, under the First Arch—and let the watchman guard carefully the Gate.

After the announcement by the Messenger, he turned and opened the gate. The first to enter was Mr. Miner Curtis, an invalid, borne in a wheeled carriage by the advance members of the class of '83, and accompanied by his wife and son, who were graduates of last year.

Having entered the Gate, and the Gate having been closed, the class proceeded very slowly toward the Hall, passing the second and third Arches. As they walked up the beautifully decorated way, the "Choir of the Hall in the Grove" stationed at the fourth Arch, and led by Prof. C. C. Case, sang "A Song of To-day:"

* At Chautauqua, Saturday, August 18, 1883.

"Sing peans over the Past!
We bury the dead years tenderly."

At the entrance to the Hall stood the Superintendent of Instruction to welcome the coming class, and as they passed by the Arch nearest the Hall, the fifty-two little girls standing in double columns, scattered the way of the coming graduates with the beauteous flowers, emblematic of the flower-strewn paths of intellectual light which they may hope to tread in the coming years.

On entering the building the "Society of the Hall in the Grove" received their brothers and sisters with the most marked tokens of good cheer, waving their handkerchiefs and vocally expressing the kindly feeling of the seniors of the year agone.

At precisely 10:20 the "C. L. S. C. Glee Club," Prof. W. F. Sherwin, conductor, led the classes (which filled the Hall to repletion), as they sang

"A sound is thrilling thro' the trees
And vibrant thro' the air."

After the reading of the responsive services came the "Recognition," by the Superintendent of Instruction, Dr. J. H. Vincent, as follows:

Fellow Students of the Chautauqua Literary and Scientific Circle of the Class of 1883:

DEARLY BELOVED—You have finished the appointed and accepted course of reading. You have been admitted to this sacred Grove. You have passed the Arches dedicated to "Faith," "Science," "Literature" and "Art." You have entered in due form this Hall, the center of the Chautauqua Literary and Scientific Circle; and now, as Superintendent of Instruction, in behalf of my associates, the counselors, who are this day absent, I greet you, and hereby announce that you, and your brothers and sisters absent from us this day, who have completed with you the prescribed course of reading, are accepted and approved graduates of the "Chautauqua Literary and Scientific Circle," and that you are entitled to membership in the "Society of the Hall in the Grove." The Lord bless and keep thee; the Lord make his face to shine upon thee and be gracious unto thee; the Lord lift up his countenance upon thee, and give thee peace.

I may say on behalf of the only counselor who is on the ground, Dr. Lyman Abbott, that his indisposition renders it unsafe for him to be here, but at my cottage he will join the procession, and go with you to the Amphitheater. We will now unite in singing

"Bright gleams again Chautauqua's wave,
And green her forest arches."

During the singing of the ode, according to the direction of the Superintendent of Instruction, the class of 1882, under the marshalship of W. A. Duncan, quietly marched from the Hall in double column, taking their position on Haven, Clark, and Cookman avenues, that the graduating class might pass through their ranks at the close of the service of recognition.

The Superintendent of Instruction, Dr. Vincent, Lewis Miller, the Messenger, the Secretary of the C. L. S. C., preceded by the children (flower bearers) and the Banner of the C. L. S. C., headed the procession, which passed out of the south side of the Hall, around Clark to Cookman Avenue, and passed down through the opened ranks of the classes of the C. L. S. C., from whom they received constant marks of recognition and affection, the classes in some cases waving their Chautauqua salute to the Chief as he passed by.

When the head of the procession reached the cottage of Dr. Vincent, a halt was made for a few moments, during which Dr. Lyman Abbott, one of the counselors of the C. L. S. C., and the orator of the day, took his place in the ranks.

As the procession marched up the long walk to the north door of the Amphitheater, immense throngs filled all the available standing room on the slopes of the ravine, and the "Blooming of the Lilies" (the Chautauqua salute) was given by

all the opened ranks of the classes as the head of the procession passed through.

The Chautauqua Band, stationed at the entrance of the north gate, discoursed sweet music during the passage of the long cortege.

All the officers, invited guests, members of the board of Chautauqua trustees, officers and members of the Chautauqua School of Languages, the Normal Alumni, and the various classes of the C. L. S. C., passed into the great Amphitheater, when the ropes were dropped, and sooner than we write it, all the remaining seating space was filled to overflowing.

The platform was filled with distinguished Chautauquans and others; the organ gave forth its sweet harmonies under the manipulation of Prof. Andrews; the Chautauqua Banner of the C. L. S. C. was stationed in full view of the vast throng; and after the devotional exercises Dr. Vincent introduced Dr. Lyman Abbott, who delivered the Commencement oration, as follows:

THE DEMOCRACY OF LEARNING.

Fellow Chautauquans :—I see in some of your eyes triumph. You have run in four years a race with uncertainty whether you could ever reach the goal. You have carried on your work under difficulties and discouragements, such as are never known to him who has perfect and continual leisure for the pursuit of studies; but in the midst of employments which were incessant and imperative in their demands upon you; and your courage, your patience, your hope, have vanquished the obstacles, and you are here to-day to receive the outward sign and symbol of your inward victory. In other eyes I see expectation. You have commenced a course and you are hopeful of achieving a result, which has been made possible to you within the last few years, that the fruits and results of study might be yours though you could not give yourself to a life of study, still less to the persistent and professional pursuit of scholarship. In other eyes I see desire dimmed by fear and doubt; you do not know whether this great realm is open to you or not; you wish that you could be assured that it is. Is this all a mistake? Is your triumph a false one, your expectation a delusive one, your hope and your desire one impossible of attainment? This is so asserted. There are not a few in our times who are of the opinion that learning is of necessity only for the few, or at all events if the many can enter a little upon the realm, they must always live upon the border and never can enter into the heart of the country.

I desire, if I may this morning, to meet and to answer this objection of skepticism, and to show that learning is within the possible reach to-day of the great body of industrious, hard-working, perplexed, and driven people of America; that it is not the privilege of the few; that it is the prerogative of the many. I desire to show you that we are entering into an epoch which I may call the "Democracy of Learning." We have already entered into the epoch of democracy in religion. The time has gone by, at least for all Protestant people, of believing that religion is for the few, or that even the higher and larger privileges of religious life are for the few. It has been established for all those who believe in an open Bible and in the universal religion of Jesus Christ that the innermost sanctuary of the temple is for every one. The great wall that before separated the court of Israel from the court of the priests has been broken down; there is but one court. The great veil that hung between the holy of holies and the court of the priests has been torn asunder, and every one of us is not only priest but high-priest, free to enter into the very holy of holies. And we have entered into the epoch of democracy in public affairs. The time has gone by when political power belonged to the few, and political intelligence was believed to be the prerogative of the few. We have come into an epoch in which political power is lodged in the hands of the great masses of the people; and it is lodged there because we believe that, on the whole, political intelligence is lodged in the hands of the great masses of the

people. I desire to show you this morning that we are entering upon an epoch of the Democracy of Learning, in which the highest and best fruits of scholarship are also the privilege and the prerogative of the many. When we have entered upon that land, then we shall be ready to enter upon the last and the completest phase of the triumphant democracy, the Democracy of Industry. Then, when intelligence shall be universally diffused, and when all men shall have the power at least of acquiring the largest and the best and the ripest fruits of knowledge and of intelligence, we shall come into that epoch in which no longer the few will control the industries of the many, but in which industry will be the controlling power, and wealth will be its servant.

I have a three-fold object this morning—I desire in the first place to show you that the fruits of learning are fruits which hang on the lower boughs of the tree where we may all pluck them; to show you not only that, but that the ripest and the best fruits of learning hang there. I desire to show you that it is not necessary that men should go through a college course and should have four years of leisure and of quiet for college study in order to reap the best fruits of a college education. The *process* of investigation must always be carried on by the few. The *results* of education may be, yea! are already becoming the property of the many. Only a few explorers can bear the perils of the Arctic Sea and investigate the mystery of the North Pole; but we can all have the fruits of their investigation. Only a few men can labor and toil in the great libraries searching out the course and progress of history and its sacred events, but we can all have the garnered fruits of their toil and their industry. Not only may we pluck a single blossom, and here and there a single half-ripened fruit from this tree; but the ripest, the best, that which has hung the longest in the sun-light, that whose cheeks are painted the most rosy red, and whose heart has in it the most saccharine juice, that is ready to-day to fall into our open palm if we will but extend it.

In endeavoring to show you this, I shall also necessarily ask you to consider with me what are the ripest and best fruits of learning. What is the object of education? It is not an end, it is a means to an end. It is a great pity that our colleges do not understand this better; for if they did better comprehend that education is a means, and that the end lies behind, fewer students would come out with empty diplomas when the college course is ended.

And incidentally I shall hope also to answer one argument which is sometimes used, and oftener, I think, lies secretly in the minds of people, against a popular and universal education. Some satirist has said that "Ignorance is the mother of devotion." If that were true, we might well doubt whether universal education is worth the price we should have to pay for it. If it were true that God held out in one hand devotion to us and in the other hand education, and said, "You must choose between these two; if you become educated you must be skeptical, if you would be devoted you must remain ignorant"—it would be a difficult question for most of us to decide whether we would have intelligence without piety or piety without intelligence. I shall show you that it is not learning, but a little learning which is a dangerous thing; and that if our work is thorough, the broader the culture, the profounder the piety.

For our purpose this morning, learning may be divided into four provinces: literature, history, science and philosophy, to which must be added in any complete topography of the realm, pure mathematics. By pure mathematics I mean arithmetic, algebra, geometry, logarithms, the calculus and the like. But pure mathematics is simply an instrument by which the scientific mind reaches certain results. I shall not therefore consider this department at all; it is not necessary for our purpose. Some one must look through the telescope, some one must know how to use the spectroscope in order to tell us what is the size of the sun and its constituent elements; but we do not need

to examine the telescope or the spectroscope. Some one must be skilled in pure mathematics in order to tell us how many miles the sun is distant from our own earth, but we may take the result without going through the process. This instrument must always be left in the hand of the specialist. I wish to show you that all that is best, highest and most important in literature, history, science and philosophy lies within the power of your acquisition. I wish to show you the spirit with which you must study, and the purpose with which you must acquire it; and I wish to show you that if you acquire in that spirit and with that purpose you can not but gain in your religious nature.

I. In the first place, then, what is literature, and why do we study it? Literature is the expression of human life, in its innermost experiences, and in its outward forms. Sometimes it is the expression of social life, sometimes of the intellectual life, sometimes of the emotional life; but always and everywhere literature is a mirror held up either before society or before the human heart; no, not a mirror, but the sensitized plate in a photographic apparatus; and the picture, now of society, now of the brain, now of the palpitating heart with its fears, hopes, joys and experiences, is given upon the plate; and literature is the picture brought out for us to examine. To study literature is not to study language. Language is merely the instrument which we use for the study of literature. To study literature is to study life—life in its outward semblance or life in its inward experiences. It is to study the life of the community and of society as we study it in Thackeray; or it is to study the life of the brain and the thought as we study it in Plato and Bacon; or it is to study the life of the inward emotions as we study it in Tennyson or Wordsworth. Now, in order to study life as it is portrayed in literature it is not necessary to know the original language in which that life was portrayed. Some one must have studied the Greek language in order to bring Homer to our intelligence; some one must have studied Latin and brought Horace within our horizon; some one must have studied French and brought Moliere within our knowledge; some one must have studied Italian in order to introduce Dante to our acquaintance; but it is not necessary for us to do so. Some one must have taken the negative and printed the picture on the paper for us; but we need not all be photographers in order to get the picture for our own enlightenment. I hold a silver dollar in my hand. Some one must have gone to the mines and dug out the ore with a pick; some one must have put it under the great stampers and beaten it out in the stamping mill; some one must have put it in the sieve and shaken it and shaken it until the grosser dross was washed away; some one must have put it into the furnace and heated it until the finer dross was eliminated; some one must have carried it to the mint and put the stamp of the United States authority upon it; but we need not all be miners digging in the mines; we need not all be workers in the stamping mill; we need not all be toilers in the furnace room; we need not all be masters or mechanics in the mint. The money was coined by those who have wrought for us, and to whom our gratitude is due, but the coin is ours; it is not merely for those who worked in producing it.

I hold in my hand an extract from Taine which expresses that which I desire to express better than I can perhaps express it myself. Let me read it: "What is your first remark on turning over the great leaves of a folio, the yellow sheets of a manuscript, a poem, a code of laws, a confession of faith? This, you say, did not come into existence all alone, it is but a mould like a fossil-shell, an imprint, like one of the shapes embossed in stone by an animal which lived and perished. Under the shell there was an animal; and behind the document there was a man. Why do you study the shell, except to bring before you the animal? So you study the document only to know the man. The shell and the document are lifeless wrecks, valuable only as a clue to the entire and living existence. We must get hold of this existence and endeavor to re-create it. It

is a mistake to study the document as if it were isolated. This were to treat things as a simple scholar, to fall into the error of the bibliomaniac."

You do not need to have traversed the ocean beach or climbed the mountain-top and gathered the shells; you may go into the museum where they have already been gathered, and study their history there. You do not need, with dictionary and grammar, to work out the secrets of the language; you may take the products of those who have thus wrought, and learn the man that lies behind the document.

Not only is it not necessary that a man should study language in order to study literature; in innumerable cases the study of the language has absolutely interfered with the study of the literature. In innumerable cases, men at college have ground away, day after day, and month after month, and year after year, over cases and nouns and parts of speech, and rules of syntax and rules of grammar—working only at the grammar, and utterly oblivious of the great light that lay behind it. Mr. Adams, of Massachusetts, has recently told us how hard a man may study Greek and how little he may know of it after he gets through with it, for he assures us that he does not know the Greek alphabet to-day, although he studied Greek six years, four years before college and two in it. I confess I should not have thought it possible for a man to have studied so much and yet know so little when he got through; but I am very certain of this, that my own experience reflects the experience of many college students. I learned more of Homer—of his life, of his character, of the lessons he has to teach, of the man himself—from reading in the "Ancient Classics for English Readers," the Iliad and the Odyssey, and from reading Bryant's translation, than I ever received from reading Homer himself in the original Greek in my college class. That which is highest, and supremest, and best in literature, you may obtain without a college education. You may learn the life, you may learn the man, you may learn the sacred truth; and you can not do that without broadening your sympathies and developing your charity. When you have read Homer and Virgil and Horace; when you have read Dante and Milton; when you have read Molière and Shakspeare; when you have read Wordsworth and Tennyson, and when, out of all this reading, you have gathered their fruits, you will find this to be true, that, though you have one picture of Greek life, one of Italian life, one of French life, one of English life, one portraying the life of four centuries before Christ, and one portraying the life of eighteen centuries after; yet in all these languages, in all these epochs, in all these civilizations the great heart of hope and joy and love and fear and reverence and faith was one. And you will learn to know that humanity, in all its nationalities, in all its epochs, in all its civilizations,—aye, and under all the varied forms of its religions, true and false—that humanity is one in all its brotherhood, and one in its great Father in heaven.

II. What is the object of studying history? What is history? It is not a mere record of dates, not the mere annals of actions, not merely the account of what men have performed or what nations have wrought. A man does not know history because he can recite glibly, beginning with Alfred the Great and coming down to the present time, the dates of the chief events and the chief epochs in English history. History is the record of God's dealing with the human race. History is the account of the great laws under which this human race has been evolved from its lowest condition to its highest condition. As the tree grows from the seed planted in the ground—first the little bud peering above the surface, then the stalk, and then the branches, and by and by the completed oak; as the child grows from the babe in the cradle, taking on one new faculty and one power after another till he comes into as yet incompleated manhood—for the completion of manhood lies afar off in the dim, distant and invisible future—so the nations of the earth, and so the whole race of man has been developed from

the seed to the oak and from the babe in the cradle to manhood in its maturity; and to read history is to read the process of this development.

What, for example, is English history? To know English history is to know that in the Bible, way back years and years before the birth of Christ—fourteen centuries before—were planted all the seeds of a free representative government; to know that in the Mosaic statutes is to be found the outline of a perfect political economy; to know that the Mosaic commonwealth had in it all the elements of those institutions which have made America a free nation; popular suffrage, representative assemblies, political government divided into three departments, executive, legislative, and judicial; a carefully framed system of laws, with a carefully framed system of penalties, a universal system of education, and a religion that was national. To know history is to know that Alfred the Great was a devout believer in the Bible as the word of God, that he studied it and found in this Old Testament, fourteen centuries before the birth of Christ, these seeds of a free government buried and forgotten. It is to know that he gathered them out of this old book, as men have gathered wheat seeds out of old mummies in the tombs of Egypt, and planted them in the more fertile soil of an Anglo-Saxon community. It is to know how the Anglo-Saxon Witenagemote grew to be an English Parliament; it is to know how the people came to be represented in it under Simon de Montfort; and how they came to be supreme in it under Charles the First, and Cromwell. It is to know how the nation was at first a congeries of conflicting tribes, partially brought together by Alfred the Great, and consolidated together under one national sovereignty by William the Conqueror, and growing thence into unity under successive statesmen, until these latter days, when William Gladstone, the greatest statesman of them all, is perfecting the Christian unity of the empire by Christian justice and equity. It is to know how, in the earlier history of this nation, the Pope of Rome assumed authority and control over the nations. It is to know how, through the centuries, the war went on between the Anglo-Saxon love of liberty and this claim of the Church of Rome; how it was begun under Augustine, continued under Thomas à Becket, brought to the beginning of the end under King Henry the Eighth, until finally under Elizabeth the bonds that bound England to Rome were severed forever, and England was made free from every foreign prince and potentate. It is to know how this seed—the sovereignty of the people in the nation, the sovereignty of the nation against the anarchy of feudalism, and the liberty of the nation against the Pope—grew into a tree, as yet but a young sapling; it is to know how then God carefully dug this sapling up, and transported it three thousand miles across the ocean and planted it in the yet more fertile soil of America. It is to know that because of the battle and bloodshed, and the long suffering endured on that soil, to-day there floats over us the banner of liberty and justice. The seeds were there in that old Bible, the culture was there in that English history; the fruit we rejoice in here to-day.

One does not need to work in the Spanish libraries with Prescott, nor in the Dutch libraries with Motley, nor among the old manuscripts of the British museum with Froude, nor among the pamphlets of English literature with Macaulay, in order to gather for himself these highest and supremest fruits of historical learning. The processes of historical research must always be carried on by the few; we must always have in this country some men who have leisure to pursue them. Alas for us, if the time ever comes when we grow careless or indifferent respecting our colleges or universities, and the kind of culture which they give; but they give culture that the cultured may give us fruit. The few garner; the heaviest are for all.

Nor is it possible for one thus to study the history of the human race, to see how, little by little, liberty has grown, education has grown, humanity has grown, and not grow himself in faith in an overruling Providence, and in hope in the Supreme God

As the broad, comprehensive, interior study of literature will give breadth of sympathy, so the broad, comprehensive, and large study of history will give hope. When the fog covers the ocean, and the mariner befogged knows not where he is, and can not tell whence his course has been, nor where it shall be, he sometimes goes aloft and from the top-mast, looking above the fog, discerns the coast in the distance and the entrance into the harbor. In history we rise out of the fog that environs all in the lower level; we look above the fog and over it, and know then the courses we have traced, and see the harbor and the haven not far before us.

III. What is science, and for what purpose do we study it? I use, of course, the word science in its restricted sense, meaning natural science. For two purposes. Nature is a vast and wonderful machine; its mechanism may well arouse both our astonishment and our admiration. If you have a watch that keeps time so that it does not vary more than two or three minutes in a year you are proud of it, and if you should by chance have a watch that did not vary more than one minute in a year you would be a remarkably humble man if you did not boast of it to your acquaintances. But in the heavens the sun and the planets round it have been keeping time for the centuries, and as yet astronomy has not detected an appreciable variation in its time. What a wonderful mechanism is this! If an inventor should construct a furnace which would keep us warm in winter and cool in summer, no manufacturer would be able to supply the orders. But you have within you a furnace such that although you may go from the land of the Esquimaux with the thermometer 40° below zero, to the tropics with the thermometer 110° above zero, this furnace does not allow the habitation in which you dwell to vary more than four or five degrees. What a wonderful mechanism is this nature which we study! And we study this mechanism partly that we may use it, that we may lay hold on these great forces of nature and make them subservient to our will by understanding the laws which regulate and govern them. But nature is more than a machine; nature is also a book, and a wonderful book, written all over in hieroglyphics that require study for their apprehension. It is more than a mechanism. It is a revelation; and it reveals wondrous things to him who knows how to read it aright. Edison and Morse, Copernicus and Newton—they have interpreted nature on the one side; but Wordsworth, and Longfellow, and Bryant—they have interpreted nature on the other, and the one class of interpretations is as valuable as the other. We study nature as a mechanism that we may know how to use it; we study nature as a book that we may know how to read it.

Now, all that which is most valuable in nature, as a mechanism, we lay hold of and use without going through the labor necessary in the original examination by the first investigator. We do not need to understand the laws of heat and steam to use them; some one has learned the laws, and has brought fire and water together and has pronounced a nuptial blessing over them, and a child has been born of the marriage, and we take steam for our slave without knowing the ritual which married the father and mother. Some one must have learned how to reach his hand to the cloud, and bring down the electricity, make it run our errands and serve the purpose of our illumination; but we do not need to know the processes in order to sit under the light. Not only is it true that the mechanical uses that come from natural sciences we get without going through the processes, but the literary and spiritual we get also. Others have been turning over the pages of this marvelous book and have been reading it to us, and unconsciously, unknowingly, almost without the sense that we have been learning anything, we have learned great lessons in this book of nature. Scientists on the one side and theologians on the other have put science and religion into antagonism with one another. But they are sister teachers of the race; science has received all its life from the late comprehended revelation of the first

chapter of Genesis that nature is man's servant, not his god; and theology has learned some of its profoundest lessons from the book of nature which science has interpreted. Consider for one moment what a fundamental religious lesson we have learned in the school-room of science almost without knowing that she was our teacher. The ancient Hebrews believed that Palestine was the world; all the rest was a mere outlying district environing it, the back yard as it were. The Mediterranean was the Great Sea, the little pond of Galilee was the Sea of Galilee, the sun and moon and stars were torches for man's illumination—that was their conception of the universe. With that conception it is not strange that they had an equally insignificant and unworthy conception of the God of the world, a conception against which the inspired writers were continually struggling, and from which they were continually endeavoring to lift the people up. When the Philistines fought against the Israelites and captured the ark of God they were in triumph. "We have captured God," they thought; and the Israelites were almost equally in despair, for they also half thought that Jehovah had been carried off a prisoner. Now, science, even more than revelation, has been enlarging our conceptions of this universe. The Holy Land, a province about as large as Vermont, is no longer the earth; the Atlantic and the Pacific are the great seas; this globe on which we live is but one of the smaller globes of the planetary system; and the great planetary system itself is but a smaller one of the great planetary systems which are circling around some vast and distant sun. Science has taught us too that all this universe is linked together, bound together by a common law, bound together by a common order of phenomena. It has investigated the sun and the stars, it has analyzed their light, it has shown us that the substances of these bodies are identical with the substances of ours. It has taught us the unity of nature, it has taught us the vastness of nature. There are stars in the firmament which you can see with the naked eye, on which if a man were standing with a telescope fine enough and powerful enough to see what is transpiring on this globe, and should look through it to-day, he would see not this congregation assembled under this roof, but the first outbreaking of the revolution, so long does it take light to traverse from our globe to the stars, light that takes but eight minutes to travel from the sun to the earth. There are stars so distant that he would see not Chautauqua gathered here to-night, but the crucifixion of Christ taking place on the hill of Calvary; stars so distant, that with a telescope powerful enough to carry the message of this world to his sight, he would see Abraham coming out of the land of his idolatry into the promised land; stars so distant that he would see this earth first taking on its brightness in the birth-day of its glory. So vast is our universe that the mind can not attempt to comprehend its majestic distances. It is not theology, it is not religion, it is not even the Bible that has unfolded this vastness; it is science. It is impossible that men who have once learned anything of this greatness of creation, or anything of this unity of creation, should ever bow down again before idols of wood and stone. So long as men thought that the laws of the material universe were antagonistic and anarchic, that the universe was made up of warring tribes and provinces, so long it was not strange that they should worship many gods. So long as they thought that it was a little province on which they lived, the boundaries of which they could themselves measure with their tape-line, they might well worship before images they had formed with their utterances or with their hands. But to-day you might burn every Bible in the land, you might burn every church and Sunday-school house, you might put all the priests and ministers in America on the great bonfire, and consume them as well, and then you might erase from every mind every lesson that had been learned from church or Sunday-school, from priest or minister, and this nation could not go back to idolatry, unless it went back to the utter barbarism of utter ignorance. That which is highest and supremest in science you can learn without

becoming a scientist; and you can not learn it without learning the large reverence that is the very foundation of religion.

IV. What is philosophy? The study of philosophy is the study of the laws which govern the spiritual realm, as the study of natural science is the study of the laws which govern the natural and the physical realm. It is not studying Hegel, and Kant, and Schleiermacher; it is not studying Hickock or Hopkins; it is not studying what philosophers have thought—they are the mere translators, the mere "ponies." Philosophy is the law of humanity, either social or individual. The study of philosophy is the study of the laws which God has ordained for the binding of men together into a common organism, or for the government of their individual lives. Men believed that the foundation of the State was a compact, and that each citizen gave up something of his rights for the common welfare; they believed that the foundation of the Nation was a compact in which each State gave up something which it had of right to secure the advantage of a commonwealth. So believing, they concluded that any State might withdraw from its allegiance, and they might have easily concluded that any individual might withdraw from his allegiance. It is only as we learned that we are born into the government and made a part of the State from the beginning by the ordinance of God, that we have learned what is the bond that has bound the nation together. Revolting from the Romish doctrine that marriage is a sacrament, Protestantism has been teaching for years that it is merely a civil contract. We are reaping the result of this false teaching. To-day in Puritan Connecticut, the minister can not tie the marriage bond much faster than the courts across the street can dissolve it. We have yet to learn that marriage is more than a civil contract, that it is an ordinance of God; that he who made man and woman made them that these twain should become one flesh, and made the home to be the first Church and the first State. When we have learned that, we shall have learned the foundation of the home as we have learned the foundation of the State. To study philosophy is to study the laws which govern society in its organism. All text-books are only instructions to teach us how to study life itself, which is the great text-book. To study philosophy is also to study the laws which govern the individual. It is to know that God has made you body, soul and spirit; that he has given you a physical organism, wonderful, but simply a mechanism in your hands; that he has given you a mental power wonderful in its reason's qualities, but with its partial parallels in the animals about you; it is to know that far above the body and the mind is the spirit—reverence, and love, and hope, and a living faith—that makes you one with God, and that points you to your eternal habitation. This it is to study mental and moral philosophy. It is to know how to read the secrets of your own soul. It is to know how to read the inner life of the souls of others. Books will help; scholarship will help; but the great book is the human soul, and we need not have scholarship to read that book. Burns and Shakspeare were not great scholars; but no scholar ever surpassed Burns and Shakspeare in the reading of the human soul.

No one ever exerted so profound an influence on the life of humanity as Jesus of Nazareth. You may think that Jesus was simply a man; you will not doubt that from the teachings of Jesus have gone forth an influence greater by far than went forth from Plato, or Socrates, or Confucius, or Buddha. You may think with me that he was the Son of God; you surely will not doubt the potency of the influence that proceeded from the incarnate Son of God. Jesus, the son of the carpenter, what did he know of literature, of science, of philosophy? Rather, what knowledge did he employ? He was thoroughly familiar with the literature of his day—that is, the Bible; but he never displayed or employed any critical or literary knowledge respecting it. He never discussed questions of authorship, he never debated questions of origin or date, he did not touch that which lay on the surface. He read the interior and spiritual truth. He saw in

that which to their mind was a mere annal, and a mere law the beating heart of the inspired prophet telling of God. He tore off the wrapping and made the world see it. He plucked from the psalm of David this bud, "The Lord is my shepherd, I shall not want," and in his hand it blossomed into the parable of the Good Shepherd. He plucked from the psalm of David this utterance, "Like as a father pitieth his children," and in his hand it blossomed into the parable of the Prodigal Son. He knew the life back of literature. He invented no machine, gave no hint of any, suggested no steam engine, no steam boat, no electric light. What he *knew* I say not. I may say what he used, and knowledge of nature as a mechanism he never used; but he looked into nature as a book, read her teachings, and interpreted them; in the sower going forth to sow, in the fisher gathering his fish from his net; in the bird's song in the air he heard the sweet note of trust; in the flowers blossoming from the ground he read the sweet promise of God's providing care. Things which men having eyes saw not and ears heard not he brought to their vision and their hearing. He propounded no scheme of political philosophy, none of psychology, or theology, but he taught that "One is your father, even God in heaven, and ye all are brethren;" and the great laws that are to bind together, rather the one great law of order, the law of love, this law he expounded. The son of the carpenter lived that he might teach, among the other lessons, this lesson of the democracy of learning; that learning, in its higher and more valued forms, is for the mechanic busy at his bench, for the smith grimy with toil at his forge, for the mother busiest of all, with hands and brain and heart filled with her children.

Kings of the earth have fought that they might hold the power in their own hands, and the many might be subject to them. The people have risen, and grown strong, until at last they have trampled the king and the army under their feet, and have rushed into the citadel and the palace and taken possession, and the citadel of oppression and the palace of luxury have become the temple of liberty. The priests have fought long that they might keep the people out of the temple and hold the mysteries of religion an exclusive possession. But the people have surged up against the priests and trampled them under foot, and occupied the temple of religion. The temples of learning are open; the kings of learning stand at the door, and with their scepters beckon you to come and share their coronation and their crown. The priests of learning bid you come, that they may open to you the mysteries of literature. For in the republic of letters there is no aristocracy but that of service. And they only are great who have learned how best to serve their fellow-men.

The triumph that I read in your eyes is not a false triumph. You have plucked the first fruits, and all the other brightest and best are before you for your plucking. The expectation that I read in your eyes is not a delusive expectation. The fruit is yours. The desire that I read in your eyes is not a cheating desire. The aspiration that burns within you for learning may have its gratification. You have no money? Literature is cheap. You have no time? You have as much time as Schliemann had, who stood in the long line before the postoffice and studied his Greek while waiting for the letters. You have as much time as Mary Somerville had, who wrote the volume which gave her a princely reputation among astronomers, while tending with motherly care the children in the nursery pulling at her skirts. The forces of nature come out of the ground and offer themselves to you to do the drudgery which aforetime was left to human hands, that you may have time to learn the truth of God, and the works of God, and the will of God. We stand to-day on the mountain height. We look just across the valley. The Jordan is no longer overflowing its banks, but is a narrow and shallow stream. The promised land lies there in all its richness and brilliance, and God's providence utters its promise to us Americans in this nineteenth century: "Be strong and of good courage; be not afraid, neither be thou dismayed; for

the Lord thy God has given thee this land for a possession forever."

Another immense audience assembled in the Amphitheater at two o'clock to listen to the addresses delivered to the graduating class by President Lewis Miller, and Dr. J. H. Vincent.

ADDRESS OF PRESIDENT LEWIS MILLER.

Chautauquans.—In these days of popular education, it may be profitable to examine the different sources of culture and development. First among these are books—the treasures that lie hidden in them may well awaken our inquiry and admiration, may well be worth the many hours of toil spent in preparing the mind, so that it can converse with the masters of the past and present. I do not wonder at hunger after the hidden treasures of books, for in them are power, wealth and pleasure. We need but watch the interested audiences that gather in this Amphitheater, to realize the power there is in the rostrum, how in all ages peoples have been confirmed or changed in their opinions by that mere persuasive power of words. Your mind now runs over the histories you have studied, and you recall the orators who, through the power of speech alone, have revolutionized empires, advanced or checked civilization. What pleasure to the mind and heart, to be able in our leisure hours to sit with Herodotus, Macaulay, Motley, Bancroft, and a host of others, and hear them tell their historic stories! or with David, Homer, Shakspeare, Whittier and Bryant, and let them fill our minds with the beautiful and soothing words of poetry! Does not art, in a still more condensed form, give us the history of the nations of the past? Does it not give us a clearer idea of thought? What descriptive words could give us so clear a view of the golden candlestick, around which clusters so much of interest to the Bible student, as can be had by a look at the plaster mould of the arch of Titus, in the Museum? What more rapidly moulds, and more powerfully influences, the present age than do the pictures on the walls, and the books in the libraries of our homes?

May I venture to bring before your mind that other phase of art, known as the mechanic art? That art, on which the educator has placed so small an estimate that when an apparently dull boy is found in the school or family, he is turned over to it, in the notion that stupidity can here find subsistence and compensation.

Now, give this art the power to express itself in words and in the fine arts, and I will bring back to you the days of Raphael and Michael Angelo, in which thought was expressed in words and on canvas and stone, in such purity that the student in the schools of to-day is carried back to these times, to study the perfection and beauty of expression. In the line of a better educated labor lies the settlement of the great labor question. Will it be as Garfield suggests, for Chautauqua to provide not only for the leisure, but secure the leisure by some system of education that will make it possible?

If by any means the mental energies can be combined with the muscles, the product of labor will be greatly increased, and the time producing the same quantity lessened. Struggling labor hardly sees that in the short space of about thirty years the time has been lessened from thirteen and fourteen hours to ten hours per day, and the wages enhanced from fifty and seventy-five cents per day to an average of two dollars per day. In most of the prominent manufacturing establishments throughout the North we are at a near approach to a reduction of time to eight hours—and may God speed the day. Take the advance in quantity of products for ten years only, and by the aid of machinery, and more intelligent labor, we have gained more than two hours. Why should not labor get its due proportion? We are fast turning the drudgery of labor to pleasure. You need but visit the dish-washing and laundry-rooms at the Hotel Athenæum to witness the truth of what I state.

Some years ago I made an estimate of the number of inhabitants it would require to do by hard labor that which was done at that time by twelve thousand inhabitants by the use of steam and water power. It reached the enormous number of three hundred thousand inhabitants. From this we may learn that it will not be a great hardship to give to labor more leisure and more pay, not rashly as by strikes, but by prudent and gradual measures.

Ah, the wealth of nations rests in this art! The power to subdue forests and belt empires with railroads and telegraphs, and ignore distance is in its hands.

This art sends forth its missionary in its manufactured products to all quarters of the globe; every different product is a copy of a volume on some subject, carrying with it some Christian's impress and prayer. So true is this that it needs no great expert to tell an article made by Christian hands from that made by heathen.

This power of the individuality impresses with interest and wonder. How readily thoughts in words are detected from others, even on the same subject. Every workman of a manufactured article in some such sense makes his individual impress on the work he performs, and it is as readily told. The Christian, liberty-loving intelligence is pressed into every article and sent forth on its mission of preaching the gospel to every creature, even gaining entrance where the missionary is refused. With this truth in mind, with what renewed pleasure must the liberated laborer make still greater impress of his individual mind. This thought can be carried into all that we do. Our walk, our talk, and the expression of our faces all enter into our products of whatever kind. How important that it should be imbued with the spirit of intelligent Christianity.

Class of '83, you have only opened the doors to wider range, to fields of greater usefulness. All about you lie sleeping elements to be quickened into activity. Have your accumulated mental development well stored, and constantly add more. The purpose of the study was more to create an appetite for knowledge than to give a thorough or finished education.

We are glad as officers of the C. L. S. C. to present you with diplomas having places for many seals. May there be no laxity of effort until the crowning seal will emblazon over the whole its rays.

The Rev. Dr. Vincent said:

A large number of salutations from members of the C. L. S. C. have been received, some of them breathing a simple prayer of benediction on the Circle and its officers, others testifying to the value of the Circle to them intellectually, socially, and spiritually; many are too long to read at this time, but every line has been carefully read by the Superintendent of Instruction, and a few of the sentences are here reported:

From Sacramento, Cal.: "We long to be with you at the Assembly; but since we can not be, be assured that as we read of Commencement Day our hearts beat in sympathy with those of the C. L. S. C."

From Washington, D. C.: "Hearty thanks for so splendid an opportunity of living more abundantly, as I have enjoyed through the noble conception and sensible management of the C. L. S. C. I hope to add many of its seals to my diploma."

From St. Paul, Minn.: "The day in which '83 passes through the Golden Gate you, who are present amidst the jubilee, will most likely forget the distant ones; but I for one will put on my C. L. S. C. badge, take out two faded maple leaves, kept in remembrance of last summer, and in imagination march with the proud class under the Arches, while I will pray the good Lord to bless Chautauqua."

From Brooklyn, N. Y.: "The salutation, as recorded in Malachi iii:16, 'Then they that feared the Lord spake often one to another, and the Lord hearkened and heard it; and a book of

remembrance was written before him for them that feared the Lord and thought upon his name."

From San Francisco: A New Yorker writes: "I found THE CHAUTAUQUAN on a planter's table in the Sandwich Islands, and learned of a circle in Honolulu."

A member writes: "The royal road to learning is no *terra incognita*. Our *route en roi* is called *via Chautauqua*."

From Amsterdam, N. Y.: A poem closes:

"I would like very much to Chautauqua to go;
It would certainly give me great joy;
But my duties are such that I linger at home;
I've a year-old Chautauqua boy."

From Elkhorn, Wis.: One who sees through the lenses of the C. L. S. C., the Chautauqua University of the future, writes: "In 1904, A. D., I shall be fifty years old. At that time I hope to graduate at the Chautauqua University. This will give me just twenty-five years from the beginning of my course in 1876 to complete the work, and I intend to work diligently every year."

From Massachusetts: "Language would be left a beggar if I were to tell you all that the C. L. S. C. has been to me. It has been a song and a poem, when life was beginning to read like prose. It has been sunshine on many a cloudy day. God bless our alma mater, and make her days long in the land."

From New York: "When the history of the successful men and women of the next generation shall be written, may it be found that the members of the Chautauqua Literary and Scientific Circle of 1883 are among the number."

From Santa Barbara, Cal., comes the greeting of Mrs. M. P. Austin, who prays that "the C. L. S. C. may do as much for others as it has done for me."

From St. Paul, Minn., a graduate writes: "Although in middle life, I have rejoiced like a child at the prospect of graduating. My studies have been precious to me; and, although I have carried them on alone, the enthusiasm has never grown less. May I boast of the dozen recruits whom I have brought into the work, not for the name of it, but because I want everybody to be benefited as I have been. Saturday will find me in a white dress and blue ribbon, and I shall try to catch the spirit which ascends to our Father, and have something of the blessings which are invoked upon the graduates of that day. May his blessed spirit be with you, and may he be precious not only to them who believe, but to many who never before have called on his name."

From Massachusetts a member writes: "I have heard this objection to the C. L. S. C., that it leads to neglect of Bible study. My personal experience has been that I never spent more time in Bible study or loved it more than during the past four years."

From Dakota a mother writes: "Although my boy is but eleven years old, he has done the greater part of my reading this year, and dear little Maggie, nine years of age, is greatly interested in what she calls mamma's course. She also often reads for me, patiently spelling out the hard words."

William C. Wilkinson, of Tarrytown, New York, writes: "I send greeting, congratulation and God-speed to the class of 1883. A persistence on your part of four years in a course of volunteer reading and study has not only created character in you, but also proved that you possessed character to begin with. It was not perfectly easy for you to do what you have done. There have been times, more than once, during these four years, when the temptation was strong to abandon your undertaking. But you did not abandon it, simply because you would not abandon it. Your will was strong enough to overcome the strong temptation. Now your will is stronger for having been strong. Go forward in this added strength to add strength again. The will conquers by conquering, until it becomes at length unconquerable. Conquer is a proud word. Let us change it and say something meeker and truer. Let us say,

obey. We conquer only when we obey. You have obeyed your conscience in accomplishing your appointed course. That obedience is your victory. When the will is perfectly obedient to conscience, conscience being at the same time perfectly enlightened by the Word and by the Spirit of God, then we are omnipotent. We reign then with Christ. All things are ours. Go on, alumni of Chautauqua. Carry forward the banner. Let it float in your hands ever farther and higher. I do not say *plant* it anywhere. I say *bear* it onward and upward. There is always, amid the Alps of our glorious endeavor and struggle, a peak above and beyond. Climb that, and then—forward still. The goal is never attained, but the race itself is better than would be rest at the goal. Remember the ranks that are behind you, year after year, in the future. Give them a generous lead. Remember the one pioneer rank in advance of you. Tread close on their heels. Follow, so that it will be hard for your leaders to lead. Lead, so that it will be hard for your followers to follow.

"God bless and crown the Class of 1883!

"W. C. WILKINSON."

Bishop Henry W. Warren writes:

"TOP OF THE ROCKY MOUNTAINS, August 1, 1883.

"*Dear Chautauquans*:—Pausing to take a farewell look at the Atlantic slope before going down that of the Pacific, my mind passes over many a place of interest and rests on Chautauqua. There is no more interesting place on the continent. How many faces rise for recognition! But I can not indulge in personal greetings, for the friends are so many and so dear that time would fail me to speak of the institution that is the outcome of the inspiration and labor of all these friends. William Cullen Bryant said Chautauqua exemplified the spirit of mutual encouragement. President Garfield said that it taught what to do with the result of civilization's first fight, leisure; and Bishop Wiley said it was a Christian center, able to save the gospel if there was nothing else left.

"Unquestionably, Chautauqua is the grandest inspiration and quickening of mind in this century or any other. It is the consummate flavoring of our Christian republican principles. It offers all opportunities for growth to all men. It seems to present as good a chance to every man as comes to any man. This development of mind is our chief wealth. We turn auriferous quartz into coin, iron ore into a body for the soul of electricity, but mind had to be developed and refined first. Rome sought wealth by the robbery of other nations, but she never gained as much wealth in a decade as we develop from nature in a year. What we need as a nation is a perpetual push and effort of the masses of men to rise. They drag down none of the few that are already eminent, but, by surpassing them, incite to greater attainments. Let there be no fear that there will be too many great men, or men too great. These vast glittering snow-peaks about me find room enough, as well as the mole hills. 'There is always room at the top,' for the top is larger than the bottom, as these bending heavens are larger than the earth, and eternity longer than time.

"Would that I could set one of these mountains near Chautauqua and let its grassy base, its wooded slopes, its masses of ore, its glittering crown of glorious light say to every beholder: Here is an object lesson worthy of God's giving to his child, here is a symbol of the eternal power of the God-head of your Father, here are hints of what his child may be. All things are for all men; whosoever will, let him come and take.

"Dear members of the C. L. S. C. of 1883, I commend you to the baccalaureate sermon of Dr. Vincent to-morrow for higher and grander utterances than these heights can give; to Dr. Abbott also for grander foundations than those of these mountains; even those of the Christian faith, for the mountains shall melt with fervent heat, but the word of God standeth forever,

"Yours in Christian knowledge and faith,

"HENRY W. WARREN."

Dr. Vincent then read the following:

Let Framingham Chautauqua hail,
The child the mother greet!
O'er intervening hill and dale,
Oh, courier, be fleet!

Say, "Brothers, fellow-students, friends,
Ne'er turn to look behind;
For they whose pathway upward tends,
The sun-crowned summits find.

"The outlook broadens, even now,
A vision rare and grand;
Hope in each heart, light on each brow,
Join welcome hand to hand!

"And while the kindly grasp gives strength,
Repeat along the line:

'We'll turn from earthly lore, at length
Beloved, to things divine.

"Bright with perennial health and youth,
When that glad time shall be,
Our guide the way, the life, the truth,
Immortal pupils we!"

After the reading of the congratulations and greetings, Dr. Vincent and President Miller presented the members of class '83, present at Chautauqua, their well-earned diplomas. Out of this wonderful class of graduates, numbering nearly 1,400, over 300 were present. The class has representatives in all of the following States and Territories:

California, Maine, Virginia, Florida, Tennessee, Pennsylvania, Massachusetts, New York, Ohio, Minnesota, Maryland, Iowa, Illinois, Georgia, Indiana, Michigan, Kansas, Rhode Island, Wisconsin, New Jersey, Texas, Vermont, West Virginia, Connecticut, Missouri, District of Columbia, New Hampshire, Colorado, Dakota, Kentucky.

Canada is also represented, and in far-away China there is one graduate. Thirteen different denominations are represented, as follows: Methodist, Presbyterian, Congregational, Episcopal, Baptist, Christian, United Presbyterian, Reformed, Unitarian, Universalist, Friends, Roman Catholics, Seventh-day Baptists.

The following occupations were represented: Teachers, house-keepers, ministers, lawyers, clerks, students, mechanics, farmers, merchants, dressmakers, milliners, music-teachers, and stenographers.

SOCIETY OF THE HALL IN THE GROVE.

At 4 o'clock p. m., the Society of the Hall in the Grove assembled in the Hall for counsel in regard to its future work. It was clearly seen by all that the prosperity of the organization, if not its very existence, required accommodations for its meetings, such as Chautauqua could not now supply. After considerable discussion of many suggestions, the following committee was appointed to consider plans for the erection of a building, or of a series of buildings, in the near future for the use of the society: R. S. Holmes, of Auburn, N. Y.; A. M. Martin, of Pittsburgh, Pa.; A. H. Gillet, Prof. Mattison, and S. J. M. Eaton, D.D. A committee on constitution, aims and plans of the organization was appointed, consisting of J. H. Vincent, D.D.; J. R. Pepper, of Memphis, Tenn.; L. C. Peake, of Toronto, Canada; R. S. Holmes and J. G. Allen. J. G. Allen and A. D. Wilder were appointed additional members of the Guard of the Banner.

After the Society of the Hall in the Grove had completed the business, a social followed, and song and chat ruled the hour.

About 9 o'clock, under the direction of A. M. Martin, the camp fires were lighted. In the midst of a light which was nearly as bright as day, R. S. Holmes, I. I. Covet, of Pittsburgh; J. H. Kellogg, of Troy, N. Y.; Lewis C. Peake, of To-

ronto; Rev. J. H. Warren, of Tennessee, and A. M. Martin, of Pittsburgh, made speeches, containing reminiscences of the past, interspersed with song, and the great crowd appeared to listen as attentively as if it had not heard a speech during the day.

But the fires have burnt low, the people surround a bed of hot coals, and the time for corn roasting has come. The boys are ready, and some not boys in years are equally eager for the "green corn dance." Without coarseness or rudeness the fun commenced, and continued till the night bells called to repose. Thus closed the graduating exercises of the C. L. S. C. Class of 1883. From morning till night the tide of life ran high, shared in by ten thousand people of all ages, from the tiny girl to the veteran of many years.

ORDER OF THE WHITE SEAL.

A meeting of the members of the Order of the White Seal was held on Saturday evening at 7:30 o'clock in the Hall, Rev. Dr. Eaton in the chair. In the absence of the secretary, the minutes of last meeting were read by the chairman. On motion, the Rev. S. J. M. Eaton, D. D., Franklin, Pa., was elected president for the ensuing year, and Mr. L. C. Peake, Toronto, Can., secretary. Rev. W. H. Rogers reported on behalf of the Committee on Individual Effort, Mrs. E. F. Curtiss for that on Local Circles, and Miss Carrie C. Ferrin for that on the Round-Table. On motion these reports were accepted. Committees for the ensuing year were appointed as follows: On Individual Effort, Rev. W. H. Rogers, Sodus, Wayne County, N. Y.; Miss Emily Raymond, Toledo, O., and Miss C. Dickey, Geneseo, N. Y. On Local Circles, Mrs. E. F. Curtiss, Geneseo, N. Y.; Miss Fannie E. Roy, Atlanta, Ga., and Clarence H. Bean, Varysburg, N. Y. On the Round-Table, Miss Carrie C. Ferrin, Ellington, N. Y.; Mrs. A. W. Briggs, Elma, N. Y., and Miss M. C. McGowan, Cincinnati, O.

MONTEREY ASSEMBLY.

The Pacific Grove Assembly, held near Monterey, California, devoted Friday, July 13, to the commencement exercises of the C. L. S. C. We give a full report of the celebration:

Friday was a perfect Monterey day. The Chautauquans gathered according to program in the large public parlor of the railroad building and fell into line for a procession. The choir sang a cheerful Chautauqua song, in which many others joined, and then "processioned." First came the president and officers of the society, then the graduates, then all members of the C. L. S. C.—then everybody. All members wore an oak leaf, which is the regulation badge, but members of the graduating class wore for a decoration a broad badge of dark garnet-colored ribbon, fringed with bullion, and with the unfailing "C. L. S. C." and the figures "1883" printed upon it in gold. They marched toward the Assembly Hall, passing under the motto-inscribed and garlanded arches, and entering the building proceeded to the front seats, which had been reserved. The hall, under the care of the decorative committee, had broken out into fresh verdure and bloom, while the letters "C. L. S. C." and the class dates, "1879-1883," had blossomed out in gold and scarlet upon the white wall behind the speakers' platform.

The hall was full to overflowing. Everybody on the grounds had been invited to be present, and the greatest interest was manifested by all. The exercises began with an inspiring Chautauqua song. An earnest and appropriate prayer was offered by Rev. Dr. Heacock, of San Jose, and then a beautiful letter of greeting from Dr. Vincent, the founder of the society, was read. It was full of cordial friendliness, outlined briefly the benefits which he trusted all had received from pursuing the C. L. S. C. studies, and pointed out the catholicity and wide helpfulness of the Chautauqua Idea. It closed with words of stimulus and encouragement, as well as congratulation. Prof

Norton now made a brief but admirable introductory address. He spoke of the Chautauqua enthusiasm and interest as an intellectual revival. It is a work for the masses, differing from that of the great universities of whose benefits only a few favored ones can avail themselves. It goes to homes of poverty, to workshops and kitchens as well as the libraries and parlors. It is food for the hungry wherever they may be. It comes to lives which have been arid and desolate through monotonous toil. He spoke of the great increase of insanity among our farming population, owing, no doubt, to the lack of healthful mental occupation. The C. L. S. C. course of reading and plans for neighborhood circles may help these lonely, overworked people to new and broader horizons of thought and life. Prof. Norton closed with a pathetic and poetic comparison between our real lives and our temporary sojourn by the great sea which tosses and surges before us. Our footsteps on the shore here are washed away by every incoming tide, so with our "footsteps on the sands of time." The great sea of eternity will soon efface all our little earthly deeds. Let us live for eternal things. Let to-day be a commencement indeed—a beginning of grander and better living, of deeds which shall survive in the long years of God.

The quartet choir sang another beautiful song, and then three essays were read from the graduates.

A delicate little prose-poem called "Childhood in Literature," by Miss Myrtie Hudson, of San Jose (a post-graduate of our society), was read by Miss Lydia Bean. The diplomas were presented by Dr. Stratton, who remarked when giving them that these diplomas do not confer degrees, but something better than a degree, for they represent mature study, habits of fixed thought and life-long intellectual growth.

There were more than forty C. L. S. C. graduates in our State this year. The following were present: Mrs. Lydia A. French, Stockton; Mrs. H. J. Gardener, Rio Vista; Miss E. A. Wood, Riverside; Mrs. A. J. Bennett, San Jose; Mrs. M. E. McCowen, Ukiah; Mrs. E. M. Reynolds, San Jose; Miss M. McBride, Dixon; Mrs. C. C. Minard, Evergreen; Mrs. Estelle Greathhead, San Jose; Mrs. Lucy N. Crane, San Lorenzo; Mrs. S. E. Walton, Yuba City; Miss Cornelia Walker, San Jose; Mrs. S. F. Gosbey, Santa Clara; Mrs. F. W. Pond, Los Angeles; Miss Alice M. Wells, Dixon; Mrs. M. H. McKee, San Jose; Miss Henrietta Stone, Mrs. Mira E. Miller, Santa Barbara; Dr. C. C. Stratton, San Jose.

After the commencement exercises the crowd dispersed, and the friends of the graduates gathered around them to congratulate and exchange friendly greetings. But it was late lunch-time, and the keen demands of appetite were never keener than here at Pacific Grove. So, with the understanding that all were to reassemble at 2 o'clock p. m., those who had lingered hastened away. The hour for meeting soon arrived, and the Chautauquans mustered in force at the beautiful cove near Prospect Park. After a lively social time, President Stratton called the meeting to order and pointed out a suggestive-looking traveling photographer, armed with the usual camera and other implements, who had been hovering about a neighboring cliff, and evidently had intentions of immortalizing the C. L. S. C. Assembly. Everybody was requested to assume a graceful attitude and a pleased expression, which they made haste to do. The beach was covered with people, standing, sitting, reclining. It was very hard work to be sober and proper, and look as dignified as future ages will demand. Our president reclined upon the sand, as befitted "the noblest Roman of us all;" the secretary sat upright and faced the music; the modest vice-president tried to get away, but was restrained by his numerous admiring friends; the small boys in front were entreated to keep still; the photographer removed the pall-like black cloth, and the deed was done. The result was quite successful, and the picture may yet hang in the "Hall in the Grove," that eastern Chautauquans may see how their transcontinental comrades look when disporting themselves by the sunset sea.

The photograph business being disposed of, the next thing in

order was the Round-Table. There was no table to speak of, but a great deal of "round"—an informal all 'round talk in a pleasant, familiar fashion. Everybody was seated upon the shining white sand, a soft gray sky overhead, a mild, warm atmosphere enfolding all, and the illimitable sea stretching out before us and breaking in soft murmurs at our feet. Members from all over the State gave, in brief conversational style, cheering reports of their various circles, and the utmost interest was manifested by all in the common weal. The tone of the meeting was decidedly inspiring, and all seemed ready to promise improvement and renewed effort.

The next evening was the mussel-bake. A blazing fire had been built upon the sand, but far from the assemblage, and much vigorous *muscle* was displayed in stirring the embers and piling on driftwood and resinous pine cones, but as to the *mussels*, perhaps the less said about them the better. There were, indeed, mussels baked, and they were passed around upon a board in the most approved style, but it must be confessed the supply was not very abundant. The whole mussel-bake was a little like Hamlet, with the part of Hamlet left out. The explanation lay in the fact that mussels can only be gathered in certain places and at very low tide, and there had been a little misunderstanding. Nevertheless, brethren, we had a grand time, an unlimited supply of apples and freshly-roasted peanuts, and we fully propose to have a mussel-bake every year!

At a business meeting held during the assembly, Rev. Dr. Stratton was re-elected to the presidency of the Pacific Coast; C. L. S. C.; Dr. C. L. Anderson, of Santa Cruz, was elected vice-president; Mrs. M. H. Field, of San Jose, general secretary and treasurer; Miss Mary Bowman, of San Jose, secretary of the Assembly, and Mrs. Eloise Dawson, of San Jose, treasurer of the Assembly. Votes of thanks were given to many benefactors, and to retiring officers, especially to Miss M. E. B. Norton, who has given our Branch the most faithful and untiring service.

Our newly elected executive committee consists of Rev. C. C. Stratton, D.D., San Jose, president; C. L. Anderson, M.D., vice-president, Santa Cruz; Mrs. M. H. Field, general secretary, San Jose; Mrs. Eloise Dawson, San Jose, treasurer; Rev. J. H. Wythe, D.D., Oakland; Prof. H. B. Norton, San Jose; Rev. I. H. Dwinelle, Sacramento; G. M. Ames, Oakland; Miss Lucy Washburn, San Jose; Prof. Josiah Keep, Alameda; Mrs. L. J. Nusbaum, Sacramento; Rev. C. D. Barrows, San Francisco; Mrs. S. E. Walton, Yuba City; Mrs. Julia Leal, Los Angeles; Mrs. E. M. McCowen, Ukiah; Clarke Whittier, M.D., Riverside; Mrs. E. A. Gibbs, Santa Rosa; Miss M. E. B. Norton, San Jose.

MONTEAGLE ASSEMBLY.

By REV. J. H. WARREN.

Monteagle Assembly is located at Monteagle, Grundy County, Tenn., on the top of Cumberland Mountain, fifteen miles from Cowan, between Sewanee and Tracy City, immediately on the railroad owned and managed by the Tennessee Coal, Iron and Railroad Company. Cowan is a small village on the Nashville and Chattanooga Railroad, eighty-four miles from Nashville and sixty-four miles from Chattanooga. The ride up the mountain from Cowan to the Assembly grounds is one of the most picturesque in this country. The ascent for the first nine miles is 1,100 feet. The Assembly owns a hundred acres of land, which have been laid out into parks, drives, avenues, and building lots. About twenty-five acres have already been improved, and quite a number of lots have been sold to individuals upon which to build cottages. An amphitheater, capable of seating 2,000 persons, on the plan of the one at Chautauqua, has been erected. Within a very short distance of the Assembly grounds is some of the most magnificent mountain scenery to be found in any country. The elevation is 2,140 feet above the sea level. The

Assembly is strictly undenominational. Each Christian denomination is entitled to four members in the board of trustees, provided they have as many members of the Assembly. The charter prohibits it from being managed for the pecuniary interest of any person or persons.

The first annual meeting of the Assembly has closed. It was a success beyond our most sanguine expectation. The Normal School and Teachers' Retreat opened July 2, and closed August 4. These schools were all well attended. More than one hundred and fifty teachers attended the Normal alone. About fifty-two studied elocution. These teachers were from several States, and a more intelligent class I have never seen collected together anywhere.

The Assembly opened July 17, and closed August 6. At the opening service there were 1,000 people present. The attendance was good during the entire Assembly. At one time on the grounds there were twenty-one States and nineteen Christian denominations represented.

In the program, two days were given to temperance, one day to Y. M. C. A. work, two days to missions, foreign and domestic, and two days to education. The meetings throughout were of great interest.

Out of the large number of speakers on the program only four or five failed to attend.

The Sunday-school normal instruction, the children's meetings, and Mr. Van Lennep's "Oriental and Biblical Museum" were interesting features of the Assembly.

But I desire to call special attention to the work of the C. L. S. C. at Monteagle. We recognize this as an institution in this country. It is fast finding its way into many of our Southern homes, and bringing sunshine and blessings to many hearts.

At our solicitation, Dr. J. H. Vincent was present two or three days of the Assembly, and represented the C. L. S. C. His words of wisdom and cheer were a joy to many hearts. There were twenty members of the C. L. S. C. present to greet him. This number was increased to seventy before the Assembly adjourned.

A permanent organization was perfected, with Miss Emma Brown, Memphis, Tenn., president, and Miss Anna W. Thomas, Memphis, Tenn., secretary. The idea is to have annual meetings at Monteagle.

Each member went away determined to organize local circles at their homes, so that when we return next year, if permitted to do so, the members will have swelled from fifty to five hundred. We hope Dr. Vincent will favor us with his presence each year.

During the Assembly a number of C. L. S. C. Round-Tables were held, which were profitable, socially and intellectually.

On the evening of July 21 was held the first C. L. S. C. camp-fire at Monteagle, under the leadership of Dr. Vincent. The speeches and songs were full of inspiration and good cheer. We only regret that hundreds of our people in the South were not present to enjoy the meetings with us, and take fresh courage and inspiration for the work of life.

Miss Thomas, our secretary, has been instructed to correspond with all members of the C. L. S. C., who were at Monteagle, and all others whose names and post-office addresses she can get. She would be glad to have the names of all who are interested in this work. We desire to arrange for some organized effort to push this work out into the many homes of our country. Let every city, town, and village, and neighborhood, organize a circle.

Those members of the C. L. S. C., who were at Monteagle, have determined to erect a Hall of Philosophy, that we may have a place in which to hold our meetings each year. This can be done very easily by a little co-operative effort.

All things considered, the Assembly was quite a success. The outlook is encouraging. Although located in the South, it is not a Southern institution, it is for the public good. Let the people come from the North, South, East, and West; all will be equally

welcome. Life is too short to harbor animosities. Let us enter the struggles and conflicts of life like heroes and heroines. As a nation, we have a grand work before us to elevate our people socially, morally, religiously, and intellectually. Monteagle proposes to do her part. Will the good people of this country stand by us in this noble work? If you will, success is sure. There is no other enterprise of the kind in the South. The people are united. Give us your prayers and co-operation. If you desire to do good with your money, take hold of Monteagle Assembly.

To the sister assemblies over the land, we send words of greeting. To all the members of the C. L. S. C. throughout this broad land we extend the right hand of fellowship. For the unity, peace, and the uplifting of our people, and the establishing of Christ's kingdom, may we all be united, heart and hand, in Christian love and sympathy.

MONONA LAKE ASSEMBLY.

No one can estimate the extent to which the C. L. S. C. is growing. One State after another surrenders to its influence. During the past year Wisconsin has taken hold of the work, and is now showing a wonderful interest in the studies of the "home college." The little text-books have found their way into many a quiet family, and are beginning to revolutionize society in every city, village, and country neighborhood.

This fact was shown very clearly at the Assembly held at Monona Lake, near Madison, Wisconsin. Many local circles sent representatives to this gathering to receive, through them, inspiration and strength for the work of the coming year. The total attendance from various localities was nearly two hundred. C. L. S. C. Day was the best of the whole session. Although an entirely new feature, yet the people became so enthused that about a thousand called for circulars of information, and many joined the Circle before they left the grounds.

Rev. A. H. Gillet, the president of the Monona Lake Branch, delivered the annual address, in which he explained most admirably the object and aim of the Circle. Twelve persons, who had completed the four years' course, were present to receive their diplomas, and notwithstanding the absence of the "Golden Gate" and the "Hall of Philosophy," everything had the Chautauqua appearance, and the very atmosphere was filled with classic odors.

The camp-fire in the evening was a feature that will never be forgotten by those present. After the feast of solid food during the day, this evening hour was filled with real enjoyment, and many humorous speeches that were made as the flames ascended and the sparks disappeared in the starry dome above, served to lighten every heart, and to close the day with the feeling that it was indeed the best of the season.

The round-table conferences, conducted by Rev. A. H. Gillet, were full of interest. Some very important questions were discussed, and the members present prepared for successful work in their respective homes. The Chautauqua Songs were sung at all of these meetings, and never did "Day is Dying in the West" sound more sweetly than at Monona Lake.

But of all the exercises connected with the Circle, the Sunday evening vesper services were the best. Here was shown the real secret of Chautauqua success. Nearly every member, engaged during the week in gathering knowledge of art, science and literature, was found in his place on Sunday evening, lifting his heart to God, and showing thereby that we "keep our Heavenly Father in our midst."

The organization of Monona Lake Branch was perfected by the election of Rev. A. H. Gillet as president, and Mrs. William Millard, of Milwaukee, secretary. An executive committee was appointed to arrange the plans for next year. We look forward to good reports from this daughter of Chautauqua, and give her a hearty welcome.

ISLAND PARK ASSEMBLY.

Unusual interest was manifest this season at Island Park, near Rome City, Indiana. The Assembly, conducted by Rev. A. H. Gillet, of Cincinnati, Ohio, was a great success. The place is growing in favor each year, and the fire kindled there will not only continue to burn, but to spread, until every hamlet within a radius of many miles shall receive the light and warming influences that come from such gatherings. The attendance this year was larger than ever before, the people were of a better class, and the program, as carried out, gave universal satisfaction. The singing of the Wilberforce Concert Company delighted everybody. Among the lecturers were Drs. O. H. Tiffany and C. H. Fowler, of New York City; Dr. Justin D. Fulton, of Brooklyn, N. Y.; Drs. Stocking and Alabaster, of Detroit, Michigan, and Dr. P. S. Henson, of Chicago, Illinois. Dr. W. C. Richards, of Chicago, gave several very interesting lectures on "Electricity." The Island Park Branch of the C. L. S. C. was regularly organized this year, with Rev. A. H. Gillet as president, and J. L. Shearer, of Fort Wayne, Indiana, secretary. There were over two hundred members in attendance. The daily round-table conferences, conducted by Rev. Gillet and Dr. J. L. Hurlbut, of Plainfield, N. J., were highly appreciated by the members present, and many valuable suggestions given and received by these mutual discussions. The circle is enlarging continually in Indiana and Michigan, so that there is scarcely a town or village in which there is not a local circle, or at least a few individual members. Many have joined the class of '87, and quite a large number, having completed the four years' course, were present to receive their diplomas. C. L. S. C. day was the best of the session. Dr. C. H. Fowler, of New York City, delivered the annual address. The campfire was the grandest ever seen at Island Park.

Plans for the erection of a C. L. S. C. building are under consideration, a reading-room for the benefit of the Circle, an Island Park lecture association, and many other novel features are things of the near future.

The Music College, under the direction of Prof. C. C. Case, of Akron, Ohio, the school of languages, the department of elocution, the art school, and the secular teachers' normal were also well attended. It is the intention of the managers to lengthen the time of these departments next year, and to offer additional facilities to those who wish to improve their vacation by carrying on some line of study. On the whole, we can say that Island Park Assembly is a fixed fact, a thing that has come to stay, and we are glad that the people are beginning to appreciate and to value the educating and refining influences of these gatherings.

LAKESIDE ASSEMBLY.

A regular "C. L. S. C. Day" was provided for in the program at the Lakeside, Ohio, Sunday-school encampment, and the "recognition of the Class of '83" arranged for. The absence of Rev. J. H. Vincent, D.D., was an unexpected and greatly lamented interruption to our plans. But the inspiration of the "Chautauqua Idea," which Lakeside has caught and thoroughly incorporated into its own fiber, did not allow a dampening of ardor, and so the "day" went on as days will, and especially such sunny days by Lake Erie as that was. Happily Lewis Miller, Esq., President of the C. L. S. C., was persuaded to remain a while and lend his cheery face, his wise words and his authoritative presence to the occasion.

A large audience, filling the capacious Auditorium, assembled, the members of the Class of '83 took seats on the platform, and President Miller occupied the chair. After opening exercises in the use of the responsive services provided, copies of which were distributed among the audience, addresses were delivered by Rev. Dr. Hartupce, Rev. Dr. Worden, Prof. Frank Beard, and Rev. B. T. Vincent. After these had concluded,

President Miller called the members of the class to their feet, and in a neat and appropriate address "recognized" them thereby as graduates of the Chautauqua Literary and Scientific Circle, as part of the great class of fourteen hundred for the current year. A round-table was also held, conducted by Rev. B. T. Vincent, at which the subject of C. L. S. C. work was taken up by those present, and treated in a most practical manner. Representatives from several local circles gave outlines of their plans of work, and questions from interested students as to methods, etc., brought forth suggestive answers, awakening new interest in the subject of study, and stirring the uninitiated, of whom many were present, into an interest in the work. A Sunday evening C. L. S. C. vesper service was also most interesting. On the last evening of the encampment, Bishop Hurst, who was present, applied the subject of general reading as represented in the C. L. S. C. in its relation to a firmer religious texture in Christian character, in a ringing address which did much toward awakening new interest in this great work. The enthusiasm excited by the meetings in this behalf was cordially felt by Lakeside people, and it is determined to make the "recognition" of the class of the current year, and also the round-table, features of the annual program hereafter.

Surrounded as Lakeside is by an immense area filled with studious and enterprising people who are taking hold of the C. L. S. C. readings, and who are finding their special center of summer gathering there, this provision will be a source of great gratification to them, and a means of extending these benefits to many who only thus are brought into contact with this agency of Christian intelligence and popular culture.

MOUNTAIN LAKE PARK ASSEMBLY.

The fifth annual session of this Assembly lasted ten days, August 7-17. Some will recall the fact that the institution was established in the Cumberland Valley, Pennsylvania, and was held there for three successive years. Last year the experiment was made of holding the meeting in the Glades, at the new resort called Mountain Lake Park, Maryland. The new field was so full of promise and hope that it was at once determined to make it the center of the movement henceforth. The place is unique in some of its features, situated in the midst of a series of table-land glades, between the peaks of the Alleghenies, in the vicinity of some most romantic and stirring scenery, and possessing an atmosphere abounding in stimulation and vigor. Two years ago the region was an uninhabited wilderness, with the Baltimore and Ohio Railroad resort, Deer Park, on one side three miles away, and Oakland, the county seat of Garrett County, two miles to the west. Now it is a summer settlement abounding in picturesque cottages, beautiful drives, and linked to a Sunday-school Assembly and to "summer schools" of various sorts for all time to come.

The lecture course of the session just past was of a high order. It included three superb addresses from Dr. Lyman Abbott, full of vigorous thought, religious ardor, and primed and charged with suggestiveness—"Why I believe in God, in Christ, and in the Bible." Prof. Cumnock gave two magnificent entertainments in the shape of readings and recitations. Prof. Young, of Princeton, delighted us with three illustrated astronomical lectures; and the Rev. Jesse Bowman Young gave three tours, illustrated also with the stereopticon: "The Marvels of Colorado," "London and Paris," and "From Dan to Beersheba." Prof. Harris, on the "Wrong side of the Moon," Dr. Huntley, on the "Amen Corner," Bishop Andrews, on "The Method of the New Testament Law," and Dr. Payne, with two lectures, all did their best work, and earned and received high appreciation.

The normal classes were under the instruction of Rev. J. B.

Young, Rev. J. T. Judd, Rev. J. Vance, and Prof. Elliott of Baltimore. The lessons were chosen in part from Dr. Vincent's "Normal Outlines," and in part were prepared by Mr. Judd.

Rev. Mr. Young conducted two enthusiastic and interesting services during the closing days of the Assembly, developing the "Chautauqua Idea." Drs. Frysinger, Van Meter, and Leech, Messrs. Judd, Vance, Baldwin, Lindsey, and others, made capital addresses, bringing out as phases of this "Idea" the following elements: home study, Bible study, normal work, study of the classics, of literature, of the sciences.

On the last night of the Assembly at Mountain Lake Park the C. L. S. C. was organized, with over fifty members, Rev. J. T. Judd, of Harrisburg, Pa., being elected president, and Miss Jennie M. Jones, of the same city, secretary.

Thus from the tip-top of the Alleghenies we send out greetings to other Chautauquans, and join in the glorious work which is in marvelous measure leavening the land.

NEW ENGLAND ASSEMBLY.

The "Chautauqua Idea" is taking deep root in the soil of New England. Four years ago the first Assembly was held on the grounds of the Framingham Campmeeting Association. There was a fair attendance, and considerable enthusiasm. Each year has been an improvement. The number in attendance has been greater, and the interest has been on the increase. This year has been the best of all. Almost from the first the lodging accommodations were taxed to their utmost in providing for the unexpectedly large numbers. The gentleman in charge of the dormitory stated to the writer that he had a greater rush the first day of the Assembly, this year, than he had the first week of last year. Thus it continued during the ten days. It is therefore safe to conclude, that in a financial way, the meeting was a success beyond its predecessors.

The work of the various departments was done efficiently by Dr. Vincent, in charge, assisted by Dr. Hurlbut, and Prof. Holmes, at the head of the normal classes; Prof. Sherwin at the front with a magnificent chorus of nearly two hundred voices; Frank Beard with a drawing class of one hundred and fifty; and the platform occupied by such men as Prof. Richards, Dr. Lyman Abbott, Dr. Angell, Wallace Bruce, Dr. Hull, Dr. J. B. Thomas, Dr. Tiffany, Prof. Young, A. O. Van Lennep, and others. A feast of good things was to be expected, and we were not disappointed.

One of the enjoyable features of the Assembly was Rev. O. S. Baketel's lecture on "Sights and Insights at Chautauqua," illustrated with eighty stereopticon views. They were shown with the calcium light, and an audience of four thousand people sat for an hour and three quarters, hearing and seeing. It created a great deal of interest, both with old Chautauquans and the many who have never seen Chautauqua.

Prof. Sherwin had several very excellent soloists, and his chorus was exceptionally fine.

One of the new buildings this year is the C. L. S. C. office. This is a very neat structure, and greatly appreciated by those having in charge the C. L. S. C. It was usually crowded during office hours. About five hundred members of the Circle were present during the Assembly. One hundred and sixty-five joined the Class of 1887. Thirty-eight members of the graduating class were present and received their diplomas from the hands of Dr. Vincent. The Class of 1884 are thoroughly organized, and are looking forward to a grand time when next year's bells shall ring in their festal day.

As usual, Mrs. Rosie M. Baketel had charge of the C. L. S. C. office. This is her third year in this position. She is one of the hardest workers on the grounds.

The presence of Dr. Vincent is always an inspiration to a Framingham audience. Though compelled to return to Chautauqua after the opening, he gave us a grand "send-off," and his presence and labors when he returned again were greatly enjoyed.

ONE OF 1882.

HOW WE CAME TOGETHER.

[The following poem, from Counselor W. C. Wilkinson's volume, recently published by Messrs. Charles Scribner's Sons, tells the story of the author's first meeting with a friend of his, who is also a friend of every reader of THE CHAUTAUQUAN—the Rev. John H. Vincent, D.D. The friendship thus formed, not less than twenty years ago, endures yet between the two as vivid as ever. It is bearing fruit not then anticipated in the associated labors which they perform for the Chautauqua Literary and Scientific Circle.]

Thorwaldsen's Lion, gray and grim,
Rock in his rocky lair,
On who would rend his lily from him,
Glowered out with dying glare.

I mused awhile the sculptured stone,
My pilgrim staff in hand;
Then turned to hold my way alone,
And lone, from land to land.

But God had other hap in store:
Even as I turned I met
A manly eye ne'er seen before—
I seem to see it yet!

Vanish the changeful years between,
Like morning-smitten rack;
As, morning-like, that crescent scene
Comes dawning swiftly back.

Again, above, that mellow noon
And soft Swiss heaven doth yearn;
Frowns still on us in pilgrim shoon
The Lion of Lucerne.

Once more each other's hands we take,
The pass-words fly betwixt;
Though slack the speed that speech may make,
When heart with heart is mixed.

I see the green Swiss lake asleep
With Righi in her dream;
We cross the lake, we climb the steep
To watch the world a gleam.

The paths are many up the slope,
And many of the mind;
We catch the flying clue of hope,
And wander where they wind.

The paths are fresh, the pastures green,
In walk or talk traversed;
The Alpland meadow's grassy sheen
With many a streamlet nursed,

And the fair meadows of the soul
Forever fresh with streams
From the long heights of youth that roll,
The Righi-Culm of dreams.

We speak of summits hard to gain,
And, gained, still hard to keep;
Of pleasure bought with glorious pain,
Of tears 'twas heaven to weep;

And of a blessed Heavenly Friend
Who, struggling with us still,
Would break the blows else like to bend
The lonely human will;

Or with some sudden vital touch,
At pinch of sorest need,
Would lift our little strength to much,
And energeise our deed.

Our talk flows on, through strain or rest,
As up the steep we go;
Each untried track of thought seems best
In hope's prelusive glow.

We loiter while the sun makes haste,
But we shall yet sit down
To watch the gleams of sunset chased
From mountain crown to crown.

Too long, too late—the splendor went
Or e'er we reached the goal;
But a splendor had dawned that will never be spent
That day on either soul.

VEGETABLE VILLAINS.

By R. TURNER.

THE PLANT COMMUNITY AND ITS VILLAINS.

No paradise could be complete for us without a pervading freshness of green in wood and field. In lazy moods and calm sunshiny weather there are few men who will not condescend to stretch out their limbs under a spreading beech, or at least to envy one who is taking life easily for a time in the shade. We all know what a pleasant faint rustle of leaves there is above, and what a flickering of mellowed sunlight comes over the eyes, and how these steal into the heart with a sense of soft content, till we are apt to become like little children, enjoying without much thought, yielding ourselves up to the delight of the mere living, letting our consciousness float along lazily on the current of being. But if we can in such circumstances nerve ourselves to reflect just a little, we shall—if we possess even a very slight knowledge of the processes of nature—become conscious that there are great silent energies and activities at work around us in every blade of grass, and above us in the cool green foliage. The leaves have myriads of invisible little mouths eagerly drinking in the unseen air, and the minute grains that give the green color to these leaves are all the while laying hold of the infinitesimal percentage of carbonic acid impurity in that air, and, invigorated by the quickening sunlight, are able to tear this gaseous impurity to pieces, to wrench the two elements that form it asunder, making the one into nutriment for themselves, and letting the other go free in its purity into the wide atmosphere. What man—with all his sound and fury, his hammering and clanking—has never achieved, is thus quietly done in summer days by every green leaf in God's world, and inorganic matter is forced to live. While the sun shines these honest workers are striving with all their might to lay hold of every atom of this gas that fouls the atmosphere for animals, and thus, while finding food for themselves, they are keeping the air sweet and pure for other, living things. The necessity is laid on them to maintain themselves by honest work; and it is interesting to reflect how massive are the material results that gather round their task. We are apt to forget that by far the greater part of the solid matter of vegetation—of the giant trees of California as well as of the tiniest grasses and green herbs—is thus gathered atom by atom from the atmosphere. One eats his potato thankfully, usually without bothering himself much as to how it came to be a potato; how the green leaves labored away, seizing the scanty atoms of an invisible gas and making them into starch; how this insoluble starch became a soluble thing, and melting away into the sap flowed through the stem to the tubers, there to form again into little grains and be laid up for future use. The rest of the nourishment of such honest plants is usually derived from the soil. The more stimulating food—within certain limits—that crops, for instance, take up by the roots, the harder do their green parts work in the sunlight, making starch and kindred substances out of what they can snatch from the atmosphere.

Hence the value of manures; they are stimulants to increased endeavor. Such honest, hard-working plants form by far the greater bulk of vegetation, and of those that grow on land nearly all are conspicuously green. Sometimes—but rarely—the green is disguised a little by another color associated with it, or some tint that is but skin-deep. Take a leaf of the copper beech, for instance, scratch the surface, and you will find the honest green beneath. Even the despised field-weeds, that come up wherever man digs or plows, and linger lovingly about his agriculture, so be it that they are green, are honest in their way, and only take hold of what earth they can find to root in, that they may participate with their fellows in the blessings to be got and given by keeping the atmosphere pure. Man wants to grow grain, or something of the kind, where they prefer to grow, and so, as they foul his husbandry, he ruthlessly roots them out, or tries at least. It is their misfortune that man does not wish them there; but still, contemned creatures as they are, they have honest ways about them, and every green grain in their being is struggling hard to do something genuinely useful. It is only an earnest striving to hold their own against man and brute, that makes humble nettles clothe themselves with stings full of formic acid and fury, and rude thistles bristle with a sharp *nemo me impune lacessit* at every prickly point. They are armed for defense, not aggression. It is not of stuff such as this that vegetable villains are made.

Since there is so much honesty, however, in the plant world, rogues, and thieves, and pilferers must abound. Consider the animal kingdom. Where herds of deer roam in the wilds there beasts of prey are on the prowl, or sportsmen stalk with murderous guns in hand. Where herrings and pilchards crowd in shoals clouds of gulls and gannets hover, and porpoises with rapacious maws tumble and roll about. Where earthworms abound there moles with ravenous appetite are furiously driving mines, or birds that have sharp, quick bills keep watch with keen eyes. And so in this honest plant community, preying on it and pilfering from it, live and flourish hosts of vegetable villains; some without a trace of green in their whole being, living by theftuous practices alone; some with just the faintest suspicion of green and the slightest indications of a true nature; others with a good deal of the better color about them, but still only indifferently honest. There is something of marvel and mystery about these plant pilferers—of strange peculiarities in their modes of life, and in their adaptations for plundering and preying, which can hardly fail to interest intelligent minds, even when brought before them in a sketch such as this, which does not profess to take in more than the outermost fringe of a wide field. Without terms and technicalities and a strange jargon of crabbed words that would be dry as dust, and meaningless to most readers, little professing to be thorough can be done; yet, after all, something more generally comprehensive may ooze through in comparatively plain English.

With regard to their pilfering habits, such plants are usually proportioned off into two great groups. They either attach themselves to other beings and absorb their juices, in which case they form a mighty host of plants of prey usually known as *parasites*; or they seek their nutriment, and find it, in dead and decaying organisms, and are then known as *saprophytes*, a somewhat hard word to begin with, for which I can not find a popular equivalent, but which merely signifies plants that grow on decomposing matter. All land plants that are not blessed with a true green color belong to one or other of these groups, and are villains in their various degrees. They make no effort to free the air from the gaseous impurity that haunts it, but, like animals, they keep fouling it instead. With a very few exceptions, all of them subsist on organic matter in some form, and this they usually draw from the plants, living or dead, on which they grow, or from decaying matter in the soil. But many of these vegetable villains run into half-honest vagaries, and succeed in raising themselves slightly above the com-

mon ruck. If they can not seize and break up carbonic acid gas, they may do a little toward atmospheric purification of a kind by laying fast hold on such organic particles as are floating in the air or brought to them in falling moisture. Plants such as these are sometimes found growing on barren sand, on hard gravel, on parapets of bridges, on leaden cisterns, on plastered walls, on slag, and in like inhospitable places, where they are compelled to turn mainly to the atmosphere and trickling moisture for food. Some such haunt mines like phosphorescent ghosts, others make themselves at home on places like the dome of St. Paul's Cathedral. In a mass two feet in length, similar strange plants were one morning long ago found by a smith on a piece of iron that he had taken, on the previous night, red-hot from his fire, and laid on his water trough. Many similar vagaries they run into that would in the telling sound almost incredible. Indeed, the whole group of the saprophytes is not to be accounted so utterly abandoned as that of the parasites. To these they are certainly nearly related, but there is more of the useful scavenger about them than of the useless thief. No sooner has death overtaken any plant than a host of them set to work to clear away the now useless organism from the world, breaking down herbaceousness into putrescence, timber into touchwood, and all at last into vegetable mould. Their mission is to seize upon decaying matter and endow it with life in a new form; and thus out of rottenness often comes wholesomeness, decay moulding itself into pleasant mushrooms, or into things unfit for human food perhaps, but that may bring the blessings of abundance to many little living creatures. If such as are edible are to be considered villains, then people of delicate palate who smack their lips over some of them have a right to insist that these should be specially classed as dainty little rogues.

Still this useful scavenging habit is nearly allied to the pilfering one. Decay attacks part of a tree, for instance, and saprophytes set to work at the dead branch, but they are apt to extend their operations to the adjoining living tissues, which die, too, and decay, till in the end the tree may be entirely destroyed. The scavenger, we can thus understand, is apt on occasion to relapse into the thief and the out-and-out villain.

To one or other of these two great groups, or occasionally to both, belong, besides a few flowering plants, the whole extensive division of the fungi, and it is to be noted that none of this curious class of plants is ever blessed with leaf-green or starch in any part of its substance. Whether minute even under powerful microscopes or measuring several feet across; whether hard as wood or a mere mass of jelly; whether horny, fleshy, or leathery; whether resisting the action of the elements for years or hardly able to outlive a puff of wind; whether beautiful, commonplace, or ugly; whether sweet-scented or otherwise, in this they agree, that in all of them is wanting that greenness which makes honest work possible, and those little grains of starch that come from honest work done.—*Good Words*.

I AM afraid that a lightsome disposition and a relish for humor are not so common in those whose benevolence takes an active turn as in people of sentiment, who are always ready with their tears and abounding in passionate expressions of sympathy. Working philanthropy is a practical specialty, requiring not a mere impulse, but a talent, with a peculiar sagacity for finding its objects, a tact for selecting its agencies, an organizing and arranging faculty, a steady set of nerves, and a constitution such as Sallust describes in Catiline, patient of cold, of hunger, and of watching. Philanthropists are commonly grave, occasionally grim, and not very rarely morose. Their expansive social force is imprisoned as a working power, to show itself only through its legitimate pistons and cranks. The tighter the boiler, the less it whistles and sings at its work. —*Oliver Wendell Holmes*.

SLAVONIC MYTHOLOGY.*

By ADLEY H. CUMMINGS.

The mythology of various tribes and races has of late attracted much attention, while that of our own ancestors of the North has been studied with the greatest care.

Little attention, however, has been devoted to the religious belief of the ancient Slavonic race, and yet it is replete with interest for all who yield to the fascination of ancient myth.

We unfortunately possess no Slavic Edda, or Veda, to throw illumination upon the ancient creed of the tribes, but a few scattered facts have come down to modern times—principally contained in popular songs—but sufficient to enable us to observe the similarity between Slavonic mythology and that of the other members of the Indo-European stock—all pointing to that immensely ancient time when the ancestors of the combined race could have been gathered within the circuit of the same camp; when they passed the same lives and worshiped the same divinities; wept when the "serpents of the night" strangled the god appointed to preside over the day, and rejoiced together with an exceeding great joy when the day-god, victorious over his foes, gilded the hills again.

In Slavonic tradition Swarog is represented as the most ancient of their gods, as the one who was originally—before Perkunas—the supreme deity of those tribes, corresponding to Sanskrit Surya, like Helios in Greece, the dweller in the orb of the sun. Swarog was the pervading, irresistible luminary, the solar deity, *par excellence*, of the race, and vague recollections of him still exist. In some places Swarog seems to have yielded to another solar deity, Dazhbog, the god of fruitfulness, represented as the son of Swarog.

The etymological signification of Dazhbog is the "day-god." With him, as a representative of the sun, was a god named Khors—probably, however, but another name of the day-god.

Ogon, answering closely to Sanskrit Agni, Latin, *ignis* (fire), was the god of fire, brother of Dazhbog; his worship was principally connected with the domestic hearth.

But the deity who stands out most prominently, who became the supreme divinity of the race, though corresponding to the Scandinavian Thor, was Perkunas, or Perun, whose name, yielding to certain laws of phonetic change, may correspond to Greek Keraunos (thunder), but more closely to Sanskrit Parjanya, called in the Rig-Veda, "The thunderer, the showerer, the bountiful, who impregnates the plants with rain." This god was forgotten by the Hellenic Aryans, who exalted Dyaus (Zeus, Jove) to the supreme position, but the Letto-Slavonic tribes bestowed upon him the endearing appellation of the "All-Father," a title which they only conferred upon the creator of the lightnings. It is said that the Russians still say, when the thunder rolls, "*Perkuna gromena*;" in Lithuanian, "*Perkuns grumena*."

The South-Slavic term for the rainbow is "Perunika," "Perun's flower," or "beauty."

"White-Russian traditions," says Afanasief,† "describe Perun as tall and well shaped, with black hair and a long golden beard. He rides in a flaming car, grasping in his left hand a quiver full of arrows, and in his right a fiery bow."

He is also represented as carrying a mace, answering to Thor's hammer, mjolnir.

After the introduction of Christianity the prophet Elijah became credited with many of the honors and functions of Perkunas. He was termed, "Gromovit Ilija" (Thunder Elijah), and the origin of the notion, and the strange metamorphosis of that sweet spirit into a Boanerges, undoubtedly lie in his flight to heaven in a chariot of fire, and in his power, when on earth, of calling down fire from heaven, and of bringing the rain. Thus, II. Kings, i:10, he says, "If I be a man of God, then shall

*Extract from a lecture delivered at Pacific Grove Assembly, July, 1883, Monterey, California.

†Kjelson, "Songs of the Russian People," from whom much information contained in this sketch is gained.

fire come down from heaven and consume thee and thy fifty." Again, Kings, i., 18:41, "And Elijah said unto Ahab: Get thee up; eat and drink, for there is a sound of abundance of rain."

The Slavs considered that the thunder and lightning were given into the prophet's hands, and that he closed the gates of heaven, *i. e.*, the clouds, to sinful men, who thus might not share in his blessed reign. There is evidence of the same belief among the Teutonic tribes, and in the old High-German poem, "Muspilli," a form of that saga which prevailed throughout all the middle ages with regard to the appearance of anti-Christ shortly before the end of the world. Elijah takes the place which Thor assumes in Scandinavian myth at Ragnarok, and fights the evil one:

"Daz hōrthi rahhōn dia werol trehtwison,
Daz sculi der anti-Christo mit Eliase pāgan."

I have heard the very learned say,
That anti-Christ shall with Elijah fight.

The poem then proceeds to say that Elijah shall be wounded, and recounts the many signs and wonders that shall occur before the Muspell-doom, the Judgment Day.

Volos, or Veles, was another solar deity. It has been held that the Greek Helios appears in this name, while others have identified him with Odin, or Woden, pronounced with an epenthetic *l*, and with other changes, but the etymology seems far-fetched.

He was the special protector of cattle. The name survives to Christian times in St. Blasius. Mr. Ralston says: "In Christian times the honors originally paid to Volos were transferred to his namesake, St. Vlas, or Vlasy (Blasius), who was a shepherd by profession. To him the peasants throughout Russia pray for the safety of their flocks and herds, and on the day consecrated to him (February 11) they drive their cows to church, and have them secured against misfortune by prayer and the sprinkling of holy water. . . . Afanasief considers that the name was originally one of the epithets of Perun, who, as the cloud-compeller—the clouds being the cattle of the sky—was the guardian of the heavenly herds, and that the epithet ultimately became regarded as the name of a distinct deity."

By the names of Volus and Perun the Russians used to swear and confirm their sayings and treaties by oath.

Stribog was the wind-god. According to Russian ideas the four winds are the sons of one mother, and in the Old-Russian Igor song the wind is addressed as Sir. These winds are called Stribog's grandsons. So in India, the winds are regarded as sentient beings; thus in the Nalopākhyānam:

"Thus adjured, a solemn witness, spake the winds from out the air.

* * * * *

Even as thus the wind was speaking, flowers fell showering all around,
And the gods' sweet music sounded on the zephyr light."

Byelbog and Chernobog, the representatives of light and darkness, are of antagonistic nature—the warring principles of good and evil. Byelbog is the white, shining god, the bringer of the day, the benignant Phoebus, while Chernobog, a black god, belongs to the diabolical order.

The goddess of spring and love was Lada—corresponding closely to Freya in the Scandinavian traditions. Lovers and the newly married addressed their prayers to her, praising her name in songs. Lado, the Slavonic counterpart of Norse Freyr, has many of the same attributes as the goddess Lada, to whom the same adoration and praise were offered. Mr. Ralston says that "one Lithuanian song distinctly couples the name Lado with that of the sun. A shepherd sings, 'I fear thee not O wolf! The god with the sunny curls will not let thee approach. Lado, O Sun-Lado!' In one of the old chronicles Lado is mentioned as the god of marriage, of mirth, of pleasure, and of general happiness, to whom those about to marry offered sacrifices in order to secure a fortunate union."

Kupalo was the god of harvests, and before the harvest—on the 23d of June—sacrifices were offered to him. Young people lighted fires and danced around them in the evening, adorned with garlands of flowers, singing harvest ditties to the god. This custom still survives in the fires kindled on St. John's eve, through which sometimes the people jump and drive their cattle. The Poles and other Slavonians, especially in remote districts, keep up many of their ancient heathen rites.

The 24th of December was sacred to the goddess Kolyada, a solar deity, to whom songs were sung in celebration of the renewed life of the sun after the winter solstice "when the gloom of the long winter nights begins to give way to the lengthening day." This festival became blended with the Christmas celebration upon the advent of Christianity, and songs are still to be heard at that time containing the name of the goddess, as

Kolyada! Kolyada!
Kolyada has arrived
On the eve of the Nativity.

These ditties are called Kolyadki.

Inferior deities were believed in and many supernatural beings were supposed to haunt the woods and waters. The Russalkas, which are naiads, though no more seen, are still believed in, and are of a nature similar to the elves and fairies of western nations. "They are generally represented under the form of beauteous maidens, with full and snow-white bosoms, and with long and slender limbs. Their feet are small, their eyes are wild, their faces are fair to see, but their complexion is pale, their expression anxious. Their hair is long and thick and wavy, and green as is the grass." The Russians are very superstitious in regard to them, fearing to offend them, while the maidens go into the woods and throw garlands to them, asking for rich husbands in return.

Then there are Mavkas, or Little-Russian fairies and water-nymphs, wood demons, house spirits and numerous other minor spirits and powers which teem in the folk songs of the peasants.

Among the eastern slaves there seem to have been no temples or priests, while the contrary was true of the west. They burned their dead and greatly revered the spirits of the departed, in whose honor festivals were held.

A form of Sutteeism undoubtedly prevailed, widows destroying themselves in order to accompany their husbands to the spirit land, while slaves were sometimes sacrificed upon the same occasions—a practice common to most barbarous states of society.

Upon a general view of ancient Slavonic mythology we observe the same characteristics as among all the other Indo-European tribes—the same nature-worship and inclination to personify the powers of the air and sky; to worship the beneficent sun, which brings to man prosperity, light and happiness; to execrate the night, the enemy of the bright, the beautiful god of day. Men in the childhood of the human race were as simple as children ever have been. The same characteristics mark them. When the mother leaves her child for a moment, the babe with piteous cries calls on her to return. Why is this so? Because in the mind of the child there is no connecting link between the ideas of her going and returning; in other words, the child cannot reason enough to consider it possible—not to say probable, *certain*—that she will return.

Thus in the simple pastoral days of extreme antiquity, when the glorious sun, the light of men's eyes, the joy of their hearts, sank below the horizon, the idea of its return failed to suggest itself to their minds. Each sun-setting was a grief, each rising of the blessed orb a joy unspeakable.

And thus upon the plains of Iran, in the flowery meads of Asia Minor and on the Russian steppes, when man beheld the sun, his joy appeared, he fell on his face and thanked the regent of the sky for his light again.

Had the earth been nearer to the sun the face of Comparative Mythology had been changed; the sun-myth would have

had to seek a different origin and home, and the history of that greatest of all studies—the study of man—would have had a different course.

It is sincerely to be hoped that the future of the Slavonic tribes may be such as God and nature have intended for them, and that their name may be changed again from *slaves* to *Slavs*—"men of glory"—is the aspiration of all who have hopes for the race; in short, of all who wish well to our common humanity.

FROM THE BALTIC TO THE ADRIATIC.

By the Author of "German-American Housekeeping," etc.

We hesitated quite awhile before deciding to expend fifty thalers for a trip from Berlin to Danzig, finally concluding that the historical interest of Marienburg, through which we would pass on our return, and the reputed picturesqueness of Danzig would compensate us for the time and money. At an early hour one September morning we drove across the busiest portion of Berlin (and most unknown to the traveler), to take our train at the *ost bahn*. I had seen this portion of the large city once before, when we started to visit the country of the Wends, the original people in all the region by the Baltic.

The tedious stretch of sand (broken here and there by a peasant's house with red tile roof), was the same we had traversed so often in leaving Berlin for a neighboring town or city, the inevitable "plains of Moab" which discouraged Frederick the Great's French gardeners. How such a thriving, populous city as Berlin has ever asserted itself in the sand, is a curious study. We passed Bismarck's estate in Pomerania, "Schönhausen," and one of the party reflected upon the great statesman, the largest factor in German political life; while the other remembered the sad and dejected royal pair which was driven by Napoleon's fury to take this same route to Memel. The lovely Queen Louise and Frederick William III. were there with their royal children, praying that the tyrant's hand might be stayed, and they brought back to their rightful kingdom. Alas! death claimed the beautiful queen before the peace for which she prayed was restored to Prussia. But in her son, the present emperor, there has been perpetuated the spirit of his mother. Prussia's high position to-day has been secured not altogether by the might of her great army, nor the tremendous genius of her great statesmen, nor the ambition of her king, but by the growth of sentiment during the reigns of Frederick William III. and IV., and by the precept Queen Louise instilled into her sons during those dark and sorrowful days of exile in Memel: "My sons, let the spirit of Frederick the Great animate you," etc.

Memel, Tilsit, and Königsberg were passed, and finally the blue Baltic and Danzig were in sight. We had almost looked for amber-colored water, so long had we associated the beautiful display of amber jewels in the Berlin shop windows with the Baltic, from which it is taken. Even Homer refers to the Baltic as the resting place of amber, its bed being laid with the sunny stone.

A multitude of ship-masts rose from the coast, and from beyond the pointed gables of the old city, lessening in altitude as the vista lengthened. This first glimpse was a more fascinating picture than we were afterward able to find. Yet the hotel helped the preconceived idea that Danzig was really a second Nuremberg.

The broad stone steps, or stairway, which started from the *portecochère*, were whitened by ashes, as one so often sees them in Germany—a pretty state of things for a lady descending in a black dress. The room we were to occupy was an immense ball-room, utilized in quiet times for a bed-room. Two candles burned in their tall candlesticks on the center-table, and by the light of the twilight we could see across the street some beauti-

ful and curious carvings in the opposite gabled houses. The price paid for accommodations was large enough to have enabled us to see castles in the air, and to have our ball-room illuminated with gas until morning. We concluded they seldom had guests in this hotel, and therefore made heavy profits when some did come along.

That evening we wandered around the old crooked streets—paved in cobble-stones, which wore our shoes almost in pieces—until we were glad to pause in front of the great old red-brick cathedral. Its towers cut the big yellow moon in two at every angle we could see them. We stretched our heads to take in the tremendous dimensions of the cathedral, and the ornamentations of some of the best houses, until we suddenly remembered that it was nearing midnight, and that we had been in actual service at sight-seeing and traveling since an early hour that morning, so we returned to our ball-room and two candles. The next morning, we imagined, we would have a great treat in hunting up old carved furniture, for which Danzig, we had been told by our German friends, was equal to Augsburg; but the antiquarians had left no place unexplored. No trace of massive-legged table or curiously-carved chairs was to be found, save in the Museum and the Rathhaus (Council Hall). The stairway of the Council Hall remains indeed a monument to the ingenious designer and skillful carver, and the judge's chair is most curious.

A fine old convent has been turned into a museum. Its *kreuzgänge*, or cross-passages, give the place a most mysterious, sequestered air, and they are gradually collecting some great pictures and treasures within its walls. But the Rathhaus, in its architecture, surpasses everything in Danzig, excepting, perhaps, its fine old gateways.

The most distinguished houses in Danzig have on either side of the entrance, at a distance of five feet, immense stones hewn out of solid rock. They are nine feet, probably, in circumference. A chain is attached, which is given a graceful swing before being fastened again to either side of the front door, about as high up as the brass knocker. As these big round stones grow smaller in perspective, they give a peculiar air to a street. They seem to be peculiar to Danzig, unless one or two dwellings in Edinburgh have them. The big stones, the large chains, the tremendous brass knockers, and the innumerable windows in the six stories of the pointed gables, suggest aristocratic dwellings, and surpass the houses in Nuremberg.

An important political meeting at Stettin defeated our intention of seeing Marienburg on our return to Berlin. Marienburg is a place few foreigners find out, but Lübke, in his "History of Art," represents the architecture of the palace occupied by the knights, or crusaders, for two centuries, as one of the most exquisite ruins in all Germany. Thorn and Königsberg were also homes for this order of knights.

The following day at noon it was rather refreshing to drive into so modern and gay a place as Berlin, and forget that so many people must exist in places like Danzig. Mediæval life seems still to enwrap them there as in a garment. Their eyes are closed to any modern idea or project.

Berlin contains all that is new and progressive in Germany. That day as we sat in the garden of the "Thiergarten Hotel," eating delicious salmon, the old emperor drove by in his open carriage, with his faithful *jäger*. He was still a subject for curiosity, as it was so soon after the attempt had been made to assassinate him, June 7, 1878. He was fired on as he drove by in this same open carriage with this same faithful *jäger*. The sight of the old emperor recalled the previous months which had been so full of political stir in Europe. The session of the Berlin Congress, and the occupation of Bosnia by the Austrians had taken place.

To describe Berlin to those who have not visited it, is simply telling, generally, the size of palaces, the number of art collections, the width of streets, the squares occupied by statues, the places of amusement, etc., but even when these objects and in-

erects are put in writing they leave little impression until the place is seen. But there is another aspect of the great Prussian capital. It is a wonderful place just now, attracting so many foreign students to its university, the best musical talent to its conservatories, and the first military genius within its walls. No matter what branch of study one may choose, the instruction and illustration is right at hand. To the student of politics it is a most fruitful field, not only because distinguished statesmen frequent its streets every day, but because grave problems in political science are discussed in the Reichstag or taught in the University. The student of physics or of natural science can work under Helmholtz and others; the student of music can secure Joachim or Clara Schumann, or the student of art, Knaus, or Richter. Berlin has no pulpit orator. The Dom is more frequented because of its tombs than for any living influence it extends. It contains the coffins of Frederick William the great elector, and Frederick I., king of Prussia. The Mendelssohn choir chants its anthems, and the emperor and empress bow at its communion table; but St. Hedwig's Church is better attended. The American Chapel, built by the efforts of Mr. Wright, our American minister to the Prussian court, a devout Methodist, is still occupied and attended by travelers of the American-English type.

The annual exhibition of pictures in the academy, the many fine concerts, the treasures in the old museum, the Royal Library, the palaces, and the lovely drives along "Unter den Linden," are only mentioned to show what Berlin does contain in the way of sights and pleasures. This Unter den Linden, the street so well known, was planned by Frederick William, in the seventeenth century, and is now worn by many royal carriages and busy hurrying mortals. The street about the opera house is crowded every morning by the eager buyers of tickets, which must be secured in the morning.

Surely life in Berlin can be made very attractive, but after a long residence there I am convinced that it has little religious life. The climate is depressing, the expense of living great two other detractions. Potsdam, Sans Souci, Charlottenburg Tegel, and many other places in the suburbs, are, historically and naturally, charming resorts.

It is more compensating in Europe to go from place to place with some special work or subject in view than to go for mere sight-seeing. Your special work brings you nearer the people. If your landlady asks you what it is, and you take the trouble to tell her, she or some of her friends will at once see that you know all their acquaintances who are engaged in the same line of inquiry, and while the new acquaintances may not be socially or intellectually your ideals, yet their conversation will help you in the language and give you many opportunities.

Dresden I only know through hard work in the galleries, as though all its sights are familiar—the Schloss, Green Vaults with their immense treasures, the Military Museum, Museum of Natural History, the Grand Opera House, the Frauenkircho, Japanese Palace, cafés, coinages and statues; yet the picture gallery, with its priceless "Madonna di San Sisto" of Raphael is to me the starting point of interest and the essence of Dresden life.

From eight o'clock in the morning until four o'clock in the afternoon faithful copyists labor in the gallery. The price received for their work scarcely keeps them from starving. To go in among them for a time and work and feel as they do, enlarges one's sympathies, and teaches one to love the masterpieces of the great artists. To the uninitiated in such matters it may be well to explain that before the permission is given to copy a picture in any of the European galleries, a good deal of red tape must be looked after, especially in Germany. The director demands a specimen of the applicant's work, which must be a study from nature, either figure or landscape or still life. It is with considerable trepidation that the office of the "Herr Director" is entered. If the applicant is successful, he or she comes out with an elaborate paper containing the agreement, the

name of picture to be copied, the number, room, etc., with the director's name and the seal attached. One of the *galerie diener*, as they are called in Germany, takes you under his care, arranges an easel, a piece of carpet, a rest-stick and table. You are recognized among the copyists, and the hat of every *galerie diener* is raised at your approach or departure. When you have finished, the inspector is allowed to criticise your work. You must pay the *diener* who has waited upon you some *trink geld*, or a fee, as we would express it. At noon you can eat your cold lunch, in company with the other copyists, in front of a Raphael or a Correggio, a Titian or a Rubens, scrutinize its merits or laugh at its blunders, or speculate on the old master's methods of using their pigments, without being amenable to any court. An artist's life is a life of liberty—of thought, at least. Many of these copyists spend their afternoons in sketching, thus establishing their originality and emancipating themselves from servile observance of other men's methods. In company with these plodding, intelligent artists, I have spent many delightful hours sketching in the "Alt Markt," or the Zwinger, or at Sans Souci or Charlottenburg.

I have often wondered if the little Greek church in the suburbs of Dresden was as attractive to all travelers as to me. It is surrounded on one side by golden wheat fields, with red poppies and dark blue corn flowers growing among it. Its gilded dome, semi-domes, and minarets, shine like blazing lights against the dark blue sky. The style is such pure Byzantine and the inside so perfect in its appointments, and yet so simple; the service conducted in so solemn and devout a spirit, there seems to be much to impress the looker-on. There are no seats. On one side stand the women and on the other side the men, and before the altar the patriarch, or priest. The service is short, consisting almost entirely of singing by the men and boys, without the aid of an instrument. When the plate is passed for the collection it contains a roll of bread, the meaning of which I have never discovered, although James Freeman Clark may give it in the account of the Greek church in his "Ten Great Religions." Their belief that the Holy Ghost proceeds from the Father, and not from the Father and Son, seems to be the most essential difference in prayer between the English Church and the Greek.

A summer in the Harz Mountains, taking in Weimar and Eisnach, and the "Wartburg," is a charming experience. To find out that one can live in this age in so interesting a retreat as Weimar, for twenty dollars a month, gives back some of the simplicity to German life.

To a student of Goethe, Schiller, Wieland and Herder, no spot offers more pleasure than the quiet, old streets and groves and houses of Weimar. A mere drive through the park, passing Goethe's summer house and on out to "Tiefert," where the Grand Duchess Amelia held her little court, and the open air theater attracted a charming coterie to listen to Goethe or Schiller in some representation, re-awakens the genius of the times and arouses the appetite of the traveler for more acquaintance with the place. The next drive or stroll through the park will prove that every stone contains some rhyme, and every bench some association with those great men. There is a line to Frau Von Stein in the garden of Goethe's country house, an elegy engraved on the stone as one ascends to the Roman house in the park. The front approach to this house is not so attractive, but the back is a fascinating place. It contains on the first floor an open room with round table and benches, where the Duke and his poets sat for hours, looking over the old stone steps into the park. A short stroll from there brings one to the large open space, in the middle of the park, which was laid out by Goethe, and represents precisely the dimensions of St. Peter's in Rome. The immense ground plot of that church is here to be recognized more definitely than when one stands under its dome.

The grand ducal palace at Weimar contains one unique room, while all the others are handsome. The one which differs from

similar palatial apartments is frescoed with scenes from the works of Weimar's great poets. The halls are silent and one longs to see little fat Karl August step out of a *saal* or the Duchess Amelia greet Goethe or Schiller on the stairway as in days of yore. Mr. Lewis, in his life of Goethe, portrays such scenes with a graphic pen.

In 1832 the house in the Goethe-platz was left vacant by its great occupant. Its art treasures, its library, its various collections, showing how comprehensive Goethe's mind was, and how many things he had investigated, were abandoned, as all human efforts must be abandoned, when the silent messenger calls the soul into the presence of its Great Creator. If self-denial is required of those on earth who hope to enter into his rest, then who can answer for Goethe? But surely the choir of angels in "Faust" sing beautifully of it:

"Christ is artsen,
Praised be his name;
His love shared our prison
Of guilt and of shame;
He hath borne the hard trial of self-denial,
And triumphant ascends
To the hills whence he came."

This house still stands as he left it, and is shown every Friday afternoon to visitors. It has been occupied by his grandson for years.

The church in which Lucas Cranach's great picture is to be seen, and in which Herder preached, is a cold, heartless structure to a stranger, but its very stones and walls must respond to the prayers of the old inhabitants. The *brunnen*, or town well, in front of Lucas Cranach's house, when surrounded by a crowd of peasants offers a *genre* picture for an artist. The picture gallery is new and good. A large fresco representing Weimar celebrities is in the front entrance. Bettina Von Arnim is the only woman in the group. Perhaps her correspondence, which is by many considered spurious, will make the artist regret that he has given her so important a position in this fresco. To take an early breakfast in some lovely arbor, overlooking some historic grounds, then spend the morning in the gallery and the afternoon in the park, and the evening at the concert, is about the happiest program one can follow in a small German town.

Eisenach, the capital of Saxe-Weimar, a town of 10,000 inhabitants, will always remain associated with Martin Luther. It is the principal town in the Thuringian forest. The old "Wartburg," one and a half miles south of the town, is famous for its architecture and history. Martin Luther, the Elector of Saxony, who rescued him, and earlier the saintly Elizabeth and her cruel husband, are only a few names which are associated with it. Of course the story of the Elector of Saxony rescuing Luther, after the Diet of Worms, is well known. Yet who can resist dwelling upon this bold character at this period. After the Pope's excommunication Luther defies all threats and starts out on his return journey, with the emperor's promise of a safe-conduct; the decree for arrest follows closely every step. What a picture! to have these armed knights attack him and carry him prisoner to the old Wartburg. Then to discover afterward that a friend's hand, and not an enemy's, had done this thing. There he remained ten months, and there still remain the traces on the wall of the ink he threw at the devil. Perhaps the chapel, where he preached on Sundays, is a more becoming and decorous place to associate him with than this little room, always pointed out first.

The Wartburg has been so beautifully renovated of late at the expense of the government, it is really worth a second visit to those who may have seen it years ago. The banquet hall is certainly superb, and the St. Elizabethengang, with its beautiful frescoes and long narrow proportions, almost enables one to see the good woman walking up and down with her prayer-book, in deep meditation, before starting out through the forest with

her attendants, and her apron full of provisions for the poor. It is told that once, when her liege-lord met her, and inquired what she had in her apron (he had strictly forbidden her taking things to the poor), she, with legendary faith, opened her apron and forthwith the bread became roses.

Taking your faithful donkey which has brought you up the hill, and your Wartburg album collection of photographs, you find yourself soon wandering through the lovely and fantastic *Annenthal*, and finally resting near the depot at Eisenach. There the untiring finger of your old guide points to Fritz Reuter's house, and at last to his own little bill, which he has carefully prepared and which he expects you as carefully to pay. Never goes money from your pocket more liberally!

The Harz Mountains, their legends and songs, have been so often written of there is danger of stupid repetition if one goes over the ground.

A novel experience for an American is to have an attack of rheumatism in the house of an old Polish major in midsummer, in Wernigerode, and be attended by the physician of Count Von Stolberg. To inform those who may be so unfortunate as to meet with a similar fate what will become of them, I would simply remark that the subterfuge of every German doctor, when he finds a case getting beyond his control, is to recommend a water-cure. The one at Magdeburg being the nearest to Wernigerode, is the one which Count Von Stolberg's physician would be best acquainted with, so off to the old city and farewell to the Harz! What rheumatic patient cares for a view of a fine old cathedral from a window, or to be informed that the city has existed since the eighth century? Do these facts lessen the pain or quiet the nerves? After the bath has restored the patient, and he or she can walk out and examine the cathedral, and read of the sufferings of the people in the sixteenth or seventeenth centuries, and again how the Austrian army was resisted by Wallenstein for seven months, and how the French besieged and took it in 1806, and again in 1813—thus there is diversion in finding oneself on such historic grounds and picturesque surroundings.

(To be continued.)

IN FLOWERY FIELDS.

By MARY HARRISON.

Ye flowers in your wonderful silence,
Ye birds with your wonderful sound,
The love of my God are declaring;
For ye are the language he found.

Ye smile to the eye of my spirit,
Ye sing to the ear of my soul;
Ye waken soft echoes of anthems
Which over God's Paradise roll.

Ye bloom as ye bloomed once in Eden,
Make holy and sacred the sod;
Ye sing as you sang when in rapture
Man counted you angels of God.

By you—common things of the desert—
God's love has this miracle wrought:
Ye fill me with exquisite gladness,
With worship which silences thought.

—London Sunday Magazine

REPUBLICS where high birth gives no right to the government of the state, are in that respect the most happy; for the people have less reason to envy an authority which they confer on whom they will, and which they can again take away when they choose.—Montesquieu.

FAILINGS.

By J. MORTIMER GRANVILLE.

We all have our *failings*, and for the most part we regard them tenderly. They do not count as offences; scarcely are they held to be faults. It is always a probable conjecture that an error of omission has been unintentional; not unfrequently it seems possible it was unavoidable. A sentiment of pity for, and even sympathy with, weakness overpowers the sense of grievance; the voice of the inward monitor is silenced, and the self-excused conscience sleeps. Meanwhile failings are the worst and most mischievous, the deadliest and least curable, of the ills to which the moral nature of man is heir. They are the sources of evil whence spring the blackest vices of human character, the false roots that nourish and sustain its parasites, and steal the sap of its inner life. A failing is not merely negative; its sinister aspect is one of positive wrong-doing, wherein some behest of the will is disobeyed, a measure of moral power wasted, a rebel habit formed or fostered. To compassionate failings in others is to beg the question of fact for the sake of politeness; to look with leniency on the errors which self would fain palliate, by assuming that they are unavoidable, is to play the traitor to Truth, and let the enemy into the citadel; whereas conscience is set to guard the nature of man from treachery not less carefully than to protect it against assault.

Failings may be moral, mental, or physical, as they show themselves in the character, the intellect, or the bodily habit and powers. It generally happens that what strikes the observer as a failing is compounded of errors in feeling, thought, and action combined. The practical question is how the overt evil came into existence; or, if happily the failing should be detected in an earlier stage of growth, before it has betrayed its presence by ugly consequences, we may ask: what are the mischievous forces, where are they at work, how can they be counteracted? Why has this person the "failing" of a tendency to excessive indulgence in drink or the gratification of some unbridled passion; and that individual a seeming inability to recognize and pursue the right and honest course of conduct in the presence of any so-called "temptation" or difficulty?

Some of the most regrettable and injurious failings which disfigure and defame the character run through families, appearing in successive generations and seeming to be inherited. This theory of their perpetuation is well founded; and it has been adduced as conclusive evidence of the truth of the hypothesis that mind, and, of course, character, is the mere outcome of matter. The force of the argument obviously rests on the assumption that nothing more than, or outside, matter can be transmitted from parent to child; that a particular constitution of brain and nerve centres, a special arrangement or combination of the elements which compose the mind-organ, may be reproduced, and, if it is, a similarity of character will be entailed; but as for the independent existence of mind, or spirit, that is a pure figment of the imagination, which science will sooner or later drive beyond the pale of credulity, and to which, even now, only a few thinkers avowedly cling!

Let us examine this proposition at close quarters. It may be stated thus. All we know of mind is expressed, and understood, by physical agencies and in the formulæ of material force. Speech communicates thought, and we think in words. The faculty of forming and employing words is a brain function. If a particular region of the brain be injured or diseased, the power of using language, at least in speech, is *generally* lost. The materialist argues from this and many similar facts that mind is the product of matter. He fails to perceive that the only warrantable deduction from his own data is that mind or spirit, call it what we will, *can only express itself* through the brain as an instrument. As well deny the skill or independent existence of a musician because he can not play the full score of an opera on a flute, as infer the non-existence of a soul from the

fact that man cannot perform intellectual work without the organ of thought—the brain!

The capacity of the instrument doubtless limits the expression, but it supplies no measure of the power or skill of the performer, except in so far as the use he makes of the instrument may be a bad one. This exception is of great significance, and there will be something more to say about it presently. Meantime it is evident that, while the range of brain-power determines the *manifestation* of mind, it neither measures, nor affirms, nor disproves the independent existence of mind. The anatomist, the physiologist, and the chemist declare their inability to discover the traces of a soul in the physical organism. That no more proves the non-existence of a soul than the failure to recognize more than a certain number of planets at any stage in the history of astronomy demonstrated that there was nothing further to find.

The appeal against materialism lies to the instinct of common sense. If mind were the mere outcome of matter, science would long since have discovered some tolerably constant relation between peculiarities of physical development and manifestations of character; whereas every step onward in the progress of research tends to disprove the existence of any certain dependency or connection between morals and matter. Even such links as compose the stock-in-trade of the physiognomist and phrenologist are shown to be illusory, except in so far as they may be the effects, rather than the causes, of character, and are produced by culture—witness the effects of education on facial expression in the case of criminals. The theory of a criminal conformation of cranium has been abandoned like the silly affectation of being able to detect an offender by his "hang-dog" or "murderous" look.

"Failings" must be studied in the light of the lessons these facts and considerations combine to teach. The moral question involved is one of responsibility for the use each individual may make of the brain-power allotted to him. The neglect to employ gifts and capacities is as grave an error, from an ethical point of view, as their application to a bad purpose. The servant who buried his talent in the earth was held accountable for the failure to use it, and thereby increase its value. The parable sets forth a truth of the highest practical interest. We are responsible for the development, by use, of the faculties vouchsafed to us. If they are allowed to remain in abeyance, or a rudimentary state, we are to blame for the deficiencies and the failings to which this neglect gives rise, and are without excuse. The obligation to act up to the level of known duty cannot be avoided. A "failing" is an act of contempt for the law of development by use. It is disobedience to an understood command. The fact that it is recognized makes a failing an offence. There may be short-coming in the performance of a good resolve. Few, if any, merely human efforts are entirely successful; but the failure which occurs when an endeavor is made in the energy of a resolute and well-aimed purpose is not so much a fault as an insufficiency. The rising tide reaches its highest level by successive efforts. Self-improvement is effected in the same fashion. The motive power of persistent good endeavor is accumulative—ever advancing like the great tidal wave of the ocean—though the ground is conquered by short and seemingly only half-successful advances.

Failings, however, as we are now regarding them, are excused faults in the character which the individual makes no serious effort to repair. Some defects, as we have seen, are inherited, and upon them it is the custom to bestow great commiseration and little blame. Now, in truth, these are the least pardonable, because, if they are known to have been transmitted from parent to child, the latter has, generally, the advantage of an example, ever present to memory, by which to correct his personal deficiencies. If the "failing" be a vicious propensity, he can recall its hideousness, and thus stimulate will and conscience to aid him in eradicating the fault. If it be some form of deficiency, as indolence, lack of perseverance,

want of principle, or the like, he can study, as in the pages of history, the evil consequences entailed by the defect, and with diligence order his own conduct in better courses. Inherited failings are the least excusable. Even the materialist, who claims them as the fruit of physical peculiarities, must concede that by special culture they can be remedied, the healthy organism being susceptible of increased development in any particular direction when the proper stimuli are intelligently applied with a view to its improvement. The apologist for failings which have been inherited can find no comfort in the philosophy of materialism.

Failings which are peculiar to the individual may be less easy to detect, and the subject of these defects is, in a measure, dependent upon experience and the monitions of those around him for the information needed to correct them. This should keep the wise teachable and apt to profit by the lessons life is ever reading for their instruction. A self-reliant spirit is manly, and therefore commendable; a self-sufficient spirit is unreasonable, and therefore despicable. It is strange how few of us grow really wiser as we grow older. The work of self-improvement is seldom commenced until forced upon the judgment by some awakening experience, and this is rarely vouchsafed until the ductile period of youth has gone by. Early in the adult age of man his habits become rigidly formulated, and failings are then hard to mend. A world of unhappiness and disappointment might be spared the later years of life if the young would be warned to begin the business of training the character before it is firmly set in the mould of circumstances, with all the coarse elements—inherited and contracted—uneliminated, and the errors of inconsistency and imperfect development uncorrected.

It is in the period of youth and adolescence that the mind may be most hopefully cultivated and the moral character intelligently formed. No greater mistake can be made by a young and vigorous mind than to treat the faculty of reason and the instinct of moral judgment as parts of the being which may be left to their own devices. The young man bestows some thought on his muscular system—he trains his eye, cultivates his ear, and takes credit for prudence when he strives to develop the vigor and to foster the healthy growth of his body. Is it wise—nay, is it not rather the worst of folly and shortsightedness—to neglect the ordinary development of those higher powers which man possesses in a more exalted degree than any of the lower animals? Taking care for the body while the mind is neglected is the worst of failings—the most calamitous and the least excusable.

GONE !

By E. G. CHARLESWORTH.

Alas ! and have I lost thy voice,
Lost the sweet face that in my youth
Shone from my breast on things to be—
Hope-making, changing hope to truth,
Thy face, sweet love,
That madest beautiful the plainest thing
Below, above ?

No ; like the priest in times of old,
Who drew the temple's sacred veil,
Thou art gone into an inner fold ;
And now, thy face turned heaven's way,
A paler face, and yet not pale,
Looks for the sunset in the west ;
Thy form appears with outspread wings,
I hear thee from thine altar say,
With angel-breath o'er former things,
How beautiful is rest !

—London Sunday Magazine.

SOCIAL WRECKAGE.

By ELLICE HOPKINS.

Mr. Francis Peek has recently published a useful but saddening little book, whose title I have attached to this article. Not that it tells anything new to one who has studied deeply the pages of that terrible book of modern life, with its gilded leaves, but its unutterably dark contents ; it only focuses the scattered knowledge into alarmingly clear vision. Indeed, in reading it, it is difficult to resist the old nightmare feeling, that after all this little planet may be the small rotary Vaudeville theater of the universe, where we poor actors in life's scene are playing out a series of farces for the amusement of the angels, or more probably of darker and more distant visitants. The admirably logical social life that religiously shuts all the museums and picture-galleries on the Lord's Day, and opens all the gin-shops ; that is never tired of iterating that the proper sphere of woman is home, and brings up its 20,000 female orphans in large pauper barracks, from which the last touch of home-life has disappeared ; that goes to meetings and loudly preaches thrift to the people, and then gruffly whispers in their ear by guardians of the poor, "Only be drunk and spendthrift enough, and we will house you and provide for your old age ;" that goes to church and preaches that the body is the temple of the Holy Ghost, and leaves the people to litter down like pigs at night—men and women, girls and boys, together in tenements where no rich man would think of stabling his horses ; that goes to school and teaches its children the three R's, and leaves them in dens of infamy to learn a fourth R, by every sight and sound of the day and night, ruin of body and soul ; that virtuously declaims against the harlot, yet leaves its little girls to be brought up in brothels ; that believes a fatal disorder is undermining the national health, and shuts the doors of its hospitals against it, and denies it the public means of cure ; that legally protects the heiress up to twenty-one, and refuses to protect the poor man's daughter, even at sixteen, from the trade of vice ; that holds that the man is the responsible head of the woman, and throws the blame and disgrace on the woman—alas ! alas ! what a heap of anomalies is here—what real cause to complain of the methods of our moral life ! No wonder that the poor Dissenting minister, much entangled in our social difficulties, and led on all sides to contradictory conclusions, threw in a deprecatory clause in his prayer, "Paradoxical as it may seem to thee, O Lord, it is nevertheless true."

And what are the results of such methods as these ? What must be the results ?

That we read that in the wealthiest nation in the world, one in every thirty-one of our countrymen is a pauper ; this, moreover, without including any of that vast number of destitute persons who are maintained in charitable institutions or by private benevolence.

That in the richest city in the world there were in one year 101 deaths from actual starvation, in full sight of well-stocked shops.

That there are about 180,000 apprehensions each year for drunkenness, and over 15,000 persons yearly charged with indictable crimes, and over half a million convicted summarily before the magistrates, of which latter nearly 100,000 are guilty of personal assaults, about 2,500 being aggravated assaults upon women and children.

That there are extensive districts in London, Liverpool, and all our large towns, where our people are living in little more than half the area of ground required for a corpse, and which they could claim if they were dead, in tenements which are the graves of all decency and chastity.

That "in Liverpool alone, by a rough estimate, there are some 10,000 or more children who are neither properly fed, clothed nor housed, and surrounded by such evil associations at home, or in the low lodging-houses where they herd, that there is small

chance of their leading afterwards a useful life, and we can predict with certainty that many of them will enter our prisons, penitentiaries and workhouses."

Surely it must create an uneasy feeling in the most careless to realize this mass of misery and sin on which the life of the well-to-do classes in England is based—

"This deep dark underworld of woe,
That underlies life's shining surfaces,
Dim populous pain and multitudinous toil,
Unheeded of the heedless world that treads
Its piteous upturned faces underfoot,
In the gay rout that rushes to its ends."

It is impossible for me to deal adequately with the subject in the narrow space of a short article, but let me touch on three of our greatest problems—overcrowding, pauperism, and the care of the young.

First, as to overcrowding. This is a question that distinctly affects the state, and with regard to which we have to "live in the whole," and to see that the welfare of the community is at stake, and that the state must have an authoritative voice in it. Virtue, sobriety, decency, are physically impossible in the conditions under which a vast number of its citizens are living. The national health and morals are in danger. All the arguments that justified the interference of the state with the rights of the Irish landlord, apply equally to the London landlords, and the artificial forcing up of rents, which has resulted from the necessity many workmen are under of living near their work. Yet this question has been the subject of permissive legislation! The Artisans' Dwellings Improvement Act, an honest attempt on the part of Sir Richard Cross to deal with the problem, was rendered applicable to all towns of 28,000 inhabitants or upward—that is to say, about eighty towns—but it was entrusted to the municipalities to carry it out, the town councils which we have left to be composed chiefly of men of narrow education, largely swayed by self-interest, and probably extensive owners of the very property to be demolished! It is exactly as if the Irish Land Bill had been permissive, and entrusted to the Irish landlords to put it into execution! Can we wonder that in about sixty out of the eighty towns, it remains a dead letter? In eleven it has led to discussion; in two or three it has led to the demolition of buildings, but not to their erection. Is there not a want of ordinary *seeing* in our moral life? Could we hope to solve a single scientific problem on the methods on which we are content to live?

"The commercial success," as Mr. Peek observes, "that has been achieved by several of the Artisans' Dwellings Companies which, while providing good houses, yet pay fair dividends, shows that the poorest pay rents which give a fair interest on capital, so that the municipality will not be compelled to embark in a ruinous undertaking, or one that will not pay in the long run, to say nothing of the gain to the health and morals of the nation."

Secondly, let us take pauperism. First of all let us clearly recognize that no system of paid officials, no mechanical workhouse will take the place of human thought and human care. Nothing will do instead of love. Indeed, there are already signs that we are working out a *reductio ad absurdum* with these portentous and ever-increasing warehouses of the destitute and the vicious that are springing up, throwing the winter support of whole dissolute families on hard-working rate-payers, and systematically discouraging thrift. But the problem has been solved satisfactorily on a small scale, and can be on a larger. The Elberfeld experiment, which in twelve years reduced the number of paupers from 4,800 to 1,800, notwithstanding that the population had increased from 50,000 to 64,000, and that great commercial depression existed, has been too often described not to be familiar to all. But a remarkable parallel movement among the Jews is scarcely so well known as it deserves to be. When "Oliver Twist" was published, the leading

Jews were so mortally ashamed of the picture drawn by the popular novelist of Fagan and the low Jewish quarters in London, that they formed themselves at once into an organization to remedy so disgraceful a state of things. The numbers to be dealt with amounted to those of a populous town, with the additional difficulty afforded by immigrant Jews arriving in large numbers from the Continent in a state of the greatest destitution. The investigation of every case requiring relief was undertaken by volunteer workers, assisted by skilled officers, and was not in the steam pig-killing style, but patient and exhaustive with true human brotherhood; in deserving cases the relief given was sufficient to make a guardian's hair stand on end, but was given with the view to helping the man to a means of livelihood. Especially this wise liberality was shown in the treatment of their widows. Whilst Mr. Peek has no better suggestion to offer than that the widows' children should be removed to the pauper barrack-schools to herd with the lowest children of casuals, a system which Mr. Peek himself strongly condemns, the Jews recognized that the mother, if well conducted, was the proper person to have the care of them, and that her place was at home. They therefore either provided their widows with indoor work, or, when that was impossible, relieved them on a sufficient scale to enable them to look after their children at home; the consequence being that instead of feeding the outcast class, as the neglected children of our widows too often do, they grew up productive and well-conducted members of the community. If, however, a family was found overcrowding, all relief was steadily refused till they consented to live a human life, assistance being given to move into a larger tenement. By these wise and thoughtful methods in the course of a single generation the Jews have worked up the people from a considerably lower level to one decidedly above our own. To be sure the Jew does not drink. Give the most destitute Jew five pounds down, and at the end of the year you will find him a small capitalist, having considerably despoiled the Egyptians meanwhile. But the intemperance of our people is largely caused by overcrowding, and by their amusements and recreation-rooms being in the hands of those who make their profit not by the entertainment but by the drink traffic, and indefinite improvement may be brought about by wiser regulations that have the good of the people, and not the fattening of publicans and brewers at heart. Surely the success of the Jewish and Elberfeld efforts prove that the problem of the reduction of pauperism and the inducing of healthy habits of thrift and self-helping in the people is soluble, and with that army of devoted Christian workers in our midst, to whose untiring efforts we owe it that social disaster has not already overtaken us, it must be possible for us to carry on the same movement, if Birmingham or one of our public-spirited towns would lead the way.

Lastly, we come to the vast, hopeful field, presented by greater care for the young, and better methods of embodying it.

First, let the law protect the young of both sexes up to the legal age of majority from all attempts to lead them into a dissolute life. In most continental countries the corruption of minors is an indictable offense. The English penal code recognizes this principle in property; it is felony to abduct an heiress up to twenty-one, and a young man's debts, except for bare necessities, are null and void till he is of age; but, as usual, our English law leaves the infinitely more precious moral personality unprotected. There is no practical protection at any age for an English child from the trade of vice. An unruly child of fifteen or sixteen, or even younger, quarrels with her mother or with her employer, and runs off in a fit of temper. Even if she leaves her parents' roof, it can not be brought under the law against abduction. No one abducts her; the child abducts herself. Yet the keeper of the lowest den of infamy can harbor that child for an infamous purpose, and he or she commits no indictable offence. It is no wonder, therefore, that the open profligacy of the young forms the very gravest feature of our large towns. Thankful as we are for the honest effort to

deal with this monstrous anomaly in English law, shown by Lord Rôsebery's bill, we can not but regret the extreme inadequacy of its provisions, or that the legislature should refuse to extend legal protection from even the trade of vice, to the most dangerous age of a girl's life, the age of sixteen—the age when, as the medical faculty are agreed, a girl is least morally responsible, and most liable to sexual extravagances, and when we can statistically prove that the greatest number of those who go wrong are led astray. The country will not rest till the legal protection from the trade of vice is extended to twenty-one.

Secondly, let us recognize it as an axiom that parental rights do not exist when wholly severed from parental duties; or, in other words, that the child has its rights as well as the parent, and that its indefeasible right is, in South's strong words, "to be born and not damned into the world." Let it be recognized, then, that no child of either sex is to be brought up in a den of infamy, and to attend school from thence to the contamination of the children of the respectable poor, the magistrates being no longer allowed to defeat this beneficent provision of the Industrial Schools Act, and parental responsibility being recognized by the parent being compelled to pay toward the Christian and industrial training of the child; all children living in, or frequenting, thieves' dens and disorderly houses to be at once removed. Let day industrial schools be formed for the lowest class of children, so as to introduce some classification in our board schools, the want of which is one of their gravest defects. Let us adopt emigration to our colonies for our pauper and destitute children, whenever possible. Any one who has gone into the question can corroborate Mr. Samuel Smith's statement in his able article in the May number of the *Nineteenth Century*, that "£15 per head covers all expenses, including a few months' preparatory training, outfit, passage, etc." The average cost of each child in the metropolitan district schools is nearly £25 per annum. About 11,000 pauper children are brought up in these large establishments at a cost to the rate-payers of London of £250,000 per annum. Probably each child is kept, on the average, five years, costing, say, £120 in all. Truly Mr. Smith may well add, "with a blindness that is incomprehensible, the guardians have preferred herding them together at a vast expense, and refused till quite lately to allow emigration to be tried." And for those children who through bad health, or any other disability, are unable to emigrate, and can not be boarded out, as well as children whose drunken and dissolute parents are bringing them up to crime, let there be an order of teaching deaconesses instituted, and a state-aided training college, where educated ladies may receive training in the management of an industrial school, and from which the guardians can supply themselves with mothers for cottage homes on the plan of the Village Homes of Ilford, where the cost of a child is £14, instead of £25. By this arrangement the children would come under higher influence than the uneducated workhouse officials. Hundreds of ladies are wanting remunerative employment, and would gladly undertake this, if they could be put in the way of the work by a little preliminary training, and freed from the necessity of "doing the washing" in the cottage home. And, lastly, let it be a recognized theory that every Christian household has one respectable but rough little girl to train under its own upper class servants, to give her a good start in life, that our houses, with all their culture and refinement, may no longer be strongholds of *l'egoïsme à plusieurs*, but centers for teaching good work, high character, and fine manners—organs for the public good.

And those social atomists who raise their vehement cry about personal rights and the liberty of the subject over all compulsory measures for saving children, I would remind that the question is not of compulsion or non-compulsion; but whether the natural guardians of a child shall be compelled to pay toward its Christian and industrial training, or whether they and I, as ratepayers, shall be compelled to pay for its degradation in prisons, in infirmity beds, and workhouses. Compulsion

there is anyhow: but surely no reasonable mind can doubt which compulsion is most in accordance with the true right and true liberty.

And how can I better close than with the impassioned words of Elizabeth Barrett Browning, apostrophizing our material splendor, as shown in the great Exhibition of 1851, by the side of our moral squalor:

"O Magi of the East and of the West,
Your incense, gold and myrrh are excellent!
What gifts for Christ, then, bring ye with the rest?
Your hands have worked well: is your courage spent
In handiwork only? Have you nothing best
Which generous souls may perfect and present
And He shall thank the givers for? No light
Of teaching, liberal nations, for the poor
Who sit in darkness when it is not night?
No cure for wicked children? Christ—no cure!
No help for women sobbing out of sight
Because men made the laws? No brothel lure
Burnt out by popular lightnings? Hast thou found
No remedy, my England, for such woes?

* * * * *
Alas! great nations have great shames, I say.
* * * * *

O gracious nations, give some ear to me!
You all go to your fair, and I am one
Who at the roadside of humanity
Beseech your alms,—God's justice to be done!

AT REST.

By SARAH DOUDNEY.

Ah, silent wheel, the noisy brook is dry,
And quiet hours glide by
In this deep vale, where once the merry stream
Sang on through gloom and gleam;
Only the dove in some leaf-shaded nest
Murmurs of rest.

Ah, weary voyager, the closing day
Shines on that tranquil bay,
Where thy storm-beaten soul has longed to be;
Wild blast and angry sea
Touch not this favored shore, by summer blest,
A home of rest.

Ah, fevered heart, the grass is green and deep
Where thou art laid asleep;
Kissed by soft winds, and washed by gentle showers,
Thou hast thy crown of flowers;
Poor heart, too long in this mad world oppressed,
Take now thy rest.

I, too, perplex'd with strife of good and ill,
Long to be safe and still;
Evil is present with me while I pray
That good may win the day;
Great Giver, grant me thy last gift and best,
The gift of rest!

—*Good Words.*

BUSINESS requires earnestness and strength of character, life must be allowed more freedom; business calls for the strictest sequence, whereas in the conduct of life inconsecutiveness is often necessary—nay, is charming and graceful. If thou art strict in the first, thou mayest allow thyself more freedom in the second; while if thou mix them up, thou wilt find the free interfering and breaking in upon the fixed.—*Goethe.*

ECCENTRIC AMERICANS.

By COLEMAN E. BISHOP.

I.—THE SAILOR, PEDDLER, FARMER, PREACHER.

In mechanics, an eccentric is a wheel that can start all the rest of the machinery with a jerk and a kick, and keep it going. It was the little eccentrics that enabled ten thousand Chautauquans to scatter to every part of the land in a few hours. The cam-motion in human nature starts its machinery and scatters its thought. We ought to thank God for the minds that wobble. Every originator has been counted eccentric—many of them have been pronounced insane. The little Festuses sitting in judgment are always crying to the inspired apostles of truth, "Thou art beside thyself."

It is finite mechanism and finite thought that invent geometry and theology. Men hang, cunningly and truly, their long counter-shafts of creed, of behavior, of thought, of dress, of consistency, of loyalty; they bolt and key thereto immovably all human characters which are round, "line them up" all true and uniform, lubricate with lucre, put on the steam and away they all go beautifully and all alike. Woe be to one who wobbles in this machine-shop of society! But God uses no plumb-lines, right-angles, levels or true circles. "Nature's geometrician," the bee, never made a true hexagon. The old planets go "spinning through the grooves of change" in eccentrics, and never collide. Erratic comets dash through and among them, and never crash. I suppose the most eccentric character that ever walked this earth was that strange boy from Nazareth who confounded the doctors with his unprecedented outgivings. His teachings were indeed so strange that after the world has been for one thousand nine hundred years trying to work its standard up to them, a perfect Christian would to-day be accounted *non compos mentis* by the rest of Christendom.

So it is not a bad idea to study eccentric characters, especially if they are strangely good and oddly useful. One such, at least, we have at hand for the first study of this series—Rev. Edward T. Taylor, "Father Taylor," "The Sailor-Preacher," of Boston and the world.

Born in Virginia, reared on the sea, and adopted by New England. Born a religionist, he preached "play" sermons when a child; born again a Christian, he preached the gospel in the Methodist Episcopal Church until all humanity claimed him. Born a poet, for ten years he studied nature in her tragic and her melting moods upon the sea; studied man in the fore-castle, in the prison, upon the farm, in the market. Nature was his university; humanity his text-book; hard experience his tutor. At the age of twenty he had traveled the world over, had sounded the depths of human fortune, passion, misery, and sin; was profoundly learned in his great text-book, and the most inspired interpreter of its unuttered wants—and did not know the alphabet! He had become celebrated throughout New England as a marvelous prodigy in the despised sect of "shouting Methodists" years before he could read a text or "line" a hymn. And to the day of his death his preaching knew no method, his eloquence no logic, his conduct no consistency, and his power no limit or restraint. To this day no one has succeeded in analyzing his genius. He could not himself account for his power, nor could he control it. He seemed to play upon his audiences at will as a master plays upon the harp; yet some unseen, mysterious force played upon him in turn. His brethren in the ministry, who accounted for his strange power by attributing it to the Holy Spirit, were confounded by the rudeness, jocoseness, and at times almost profanity of his speech at its highest flights; and they who undertook to resolve his efforts into the accepted elements of human power were astounded by the more than human resources of a mind uncultured and a nature as wild, as uncontrollable, as bright and as sad as the sea he loved. Surely, if ever man was inspired, Father Taylor was.

His career, like his methods, answered to all the terms that can define eccentricity. Deeply religious as the child was by nature, he ran away to sea at the age of seven. His conversion was characteristic. Putting into port at Boston, he strolled to a meeting-house where a revival was in progress; instead of going in by the door, he listened outside, and when stricken under conviction, with characteristic impulsiveness he climbed in through the window. To use his own sailor words: "I was dragged in through the 'lubber hole,' brought down by a broadside from the seventy-four, Bishop Hedding, and fell into the arms of Thomas W. Tucker." This was at the age of nineteen. Then off to sea as a privateersman in the war of 1812, he was captured and imprisoned at Halifax, and here his preaching of the gospel strangely began. A fellow-prisoner read texts to him till one flashed upon his conception as the cue to his discourse. "Stop!" the boy would cry; "read that again." "That will do;" and he was ready to pour forth a fervid hour of pathos, wit, brilliant imagery, all supported by perfect acting.

Out of prison at last, he returns to Boston, leaves his seafaring forever, and takes to the road with a tin peddler's cart: clad in a sailor's jacket and tarpaulin, talking "sea lingo," religion and poetry in equal proportions, he traveled over New England as attractive a sight as Don Quixote would have been. He came across an old lady who taught him to read (age 21), and he paid her by gratefully holding meetings in her big kitchen, and exhorting wondering crowds of rustics and weeping crowds of penitents. Next he undertook to learn shoemaking, and then worked a farm for a living—all the time concentrating his intense nature on his grand passion for playing upon the human heart; earning little bread for himself, and breaking the bread of life abundantly to farmers, shoemakers, fishermen; in farm houses, school houses, barns, camp-meetings; over a circuit of his own organization. "He was a youthful rustic Whitefield," says Bishop Haven, "thrilling rustic audiences with his winged words and fiery inspiration." He loved to preach from the text, "How knoweth this man letters, having never learned?" Taylor did not know letters, and his speech was rude and coarse, his blunders innumerable: if words failed him out of his limited vocabulary, he manufactured them. Once, completely at fault in his struggle to express the burning thoughts that crowded his brain he cried, with a perplexed but irradiated face: "I have lost my nominative case, but I am on my way to glory!" A few smiled; all wept. His earnestness atoned for many defects; his imagery was even now beautiful, and his magnetism irresistible.

Thus young Taylor preached, unlicensed, for five years. It was the breaking-up and seed-time of New England Methodism. Between the Puritans and Quakers, with their mutual antagonism, the shouting Methodists were as corn between the mill-stones, a despised and persecuted sect.

About the age of twenty-five occurred three notable events in his life. He was licensed by the Methodist Conference to preach. He attended school a short time and began his education. He married one of God's noble-women to complete his education. For ten years he continued the life of a circuit preacher, growing in culture, power, spirit, and fame, under that wise and gentle nurture. No one can say how far short of its fullness Father Taylor's life might have fallen without Deborah Taylor.

All these seventeen years of his ministry he had, as far as possible, kept near to the coast and the haunts of sailors; praying in the fore-castle and preaching on the decks of ships about to sail, wherever he could reach them. The salt air was incense to him, and the music of the surf seemed ever dwelling in the nautilus-chambers of his heart. At last his life-work came in the direction of his longings. At the age of thirty-five he was called to preach to the sailors of Boston. The meetings were a success from the first, and Mr. Taylor went South and solicited the money (\$2,100) to buy a house for them in the South. (More bread cast on the waters to return after many days to the South.) The

work grew, and soon an incorporated society was organized, called the "Boston Port Society;" from the first nondenominational, though a majority of its board were Methodists. The work still grew. Soon the merchants of Boston assumed the burden of the work, and in 1833 "The Seamen's Bethel" was completed at a cost of \$24,000. Soon a Seamen's Savings Bank and then a Seamen's Aid Society, a Seamen's Boarding-house, and then a Mariner's Home (at a cost of \$34,000), an Industrial School for Seamen's Children, and a Seamen's Co-operative Store, sprang up around this nucleus. These collateral enterprises were largely the inspiration of Mother Taylor, but the burden of them fell upon the Unitarians of Boston, who soon assumed entire control of the noble charity and mission. Here Father Taylor fulfilled his life-mission. "From 1829 to 1871 he trod this quarter-deck, its master." The fame of the Bethel and its chaplain, one and the same, went to all quarters of the globe. Edward Everett styled him "The Walking Bethel," and Richard H. Dana in his "Two Years Before the Mast," said one of the first inquiries of sailors in foreign ports, from him, was regarding the welfare of Father Taylor, the mariner's preacher in Boston. A sailor declared he had been in ports where the United States had not been heard of, but never where Father Taylor had not. Once, soliciting aid for Bethel before another audience than his own, he glowingly promised: "Drop your gold into this ocean and it will cast a wave on the shores of Europe which will strike back to the islands of the Southern Sea, rebound on the Northwest coast, and so make the circuit of the world and strike this port again." The realization of this prediction was more extravagant than the bold imagery of it. At the dedication of the Bethel he cried: "America is the center of the world, the center of America is Boston, and the center of Boston is the Bethel."

The first place of a returning sailor's thoughts became the Bethel, instead of the groggery. Two of them, seeking it for the first time, spelled out the name on the flag floating above it: "B-E-T, beat, H-E-L, hell; beat-hell! This is Father Taylor's place," and they cast anchor. "There he is, Bill," said an old tar to another, as they entered the Bethel; "there's the old man walking the deck. He's got his guns double-shotted and will give it to us right and left. See how fast he travels—fifteen knots on a taut bowline. When he walks that way he's ready for action."

There were strange scenes in that vast audience room. The body of the church was reserved for sailors always, while the side slips and galleries were for the general public. When the seats were all filled, he would order the sailors forward like a sea captain, and crowd the altar rail, the pulpit stairs, the pulpit, and the pulpit sofas with the weather-beaten mariners, while the grandest in the land stood and listened in the aisles. "Now," he would say, with a beaming face, "we have got the hold full and a deck load, and we'll up anchor and start." Many of the best critics and reporters have tried to describe and analyze a service after such a "start"—Dickens, Harriet Martineau, Fredricka Bremer, Horace Mann, Ralph Waldo Emerson, and others—but all fail to give us much comprehension of the method of the man; I suspect because they were all so absorbed they forgot to take notes, mental or otherwise. But they recall the effects of the preaching vividly, each in his own way. So much of the power of Father Taylor was in his presence and action, that no report of one of his sermons has been made and preserved. He said himself, "You might as well try to report chain lightning." Dr. Bellows said, twelve years ago, "Alas! nothing remains of him but his memory and his influence. He will be an incredible myth in another generation." Why need this be so? He has left a wealth of original sayings behind him unequalled by the utterances of few save Abraham Lincoln; and he may furnish the material for many rare studies in character. We may be forgiven the presumption of attempting to help rescue Father Taylor from vanishing into oblivion. What, then, were the characteristics that lay at the foundations of this re-

markable character? I would classify them under four heads:

1. *Intensity.* This gave him concentration of thought, earnestness of belief, courage and aggressiveness in action. He went into everything with an irresistible impulse. His training on the sea and in the circuit gave free growth to this trait. He was never placed where he needed to be politic or conservative; and his combativeness always had free play. He was the champion of his despised sect, but he fought with the polished weapons of a wit, and the impressive presence of a will which the foes of his cause more dreaded than force. And then his spirit was so lovable that there is no instance on record of any one ever having laid hands on him, fierce disputant as he was.

He was a man born to command. His will was imperious. The last conscious act of his life was to shake his fist at his nurse, who refused to let him rise from bed. Peter Cartwright said there were two cataracts in this country—Niagara and Father Taylor. His brethren called him "the breaking-up plow of the Church." Miss Martineau spoke of "the prodigious force which he carries in his magnificent intellect and earnest heart." Another English writer said, "He goes on as energetically as any 'Praise-God Barebones' of the old Covenanter times."

I think one thing all his biographers lost sight of was the fact that his belief became a vital part of him, the very breath of his nostrils. There is a mighty difference between truly believing, and simply accepting a belief second-hand, which latter passes for belief with most people. It is the men who genuinely believe who make others accept and adopt their belief. In the pulpit his action is tremendous. He always comes down wet through with perspiration, and a complete change of wardrobe is necessary with every effort.

2. *Imagination.* To this quality is to be referred his profound religious nature, his poetry, dramatic power, eloquence, and (in conjunction with his earnestness) even his faults. One called him a poet; another, a born actor. James Freeman Clarke said he was the only man he ever heard to whom the much-abused word, "eloquence," could be truly applied. But I think none of these terms so accurately classify his genius as to call him a painter. His earnestness made everything his quick imagination conjured up seem realistic to him; and his dramatic power enabled him to make these images realistic to his hearers. His thoughts were entities to him, and they always took the form of objects real and visible. This differs from the *poetic* imagination, the essence of which is unsubstantiality. The poet sees visions, the artist creates forms. Taylor was an artist, with words for his colors, action for his pencil. One who heard him said: "While he preached the ocean rolled and sparkled, the ship spread her sails, the tempest lowered, the forked lightnings blazed, the vessel struck, her disjointed timbers floated upon the waves. It was all pictured to the eye as positive reality. You could hardly believe afterward you had not actually witnessed the scene."

He describes a shipwreck, and at the climax, as the ship is slowly settling in the water, and every face in the audience is livid with fear, he roars, "Man the life boat!" and every sailor in the house springs to his feet. Now sailors, under the influence of drink, have killed their captain. He describes the deed. They start up before the audience, creeping down the stairs and into the cabin; he raises the imaginary knife, and half the men in the house jump forward to arrest the blow, while women shriek in horror. Once, however, a matter-of-fact, though possessed sailor, confused Father Taylor. He had depicted the impenitent sinner, under the figure of a storm-tossed ship, with her sails split, and driven by the gale toward the rock-bound coast of Cape Ann. "Oh, how," he exclaimed, in tones of despair, "shall this poor sin-tossed sinner be saved?" "Put his helm hard down, and bear away for Squam!" bellowed the old salt, springing excitedly to his feet.

So he painted the Mosaic miracles, "till the brethren saw the snakes squirm, heard the frogs croak, felt the lice bite, brushed

the flies out of their faces and saw the Israelites march out of Egypt."

One of his last sermons, when he was old and feeble, ended thus: "My work is almost done. Where are all my old shipmates—they who lay in hammocks beside me and who have fought at the same guns? Gone, gone—all gone! No, blessed be God! not all; there's one left. [Here he made the picture realistic by pointing to an old salt, gray, bent, and knotty-faced.] Yes, there's old Timberhead. He and I have weathered many a storm together. It is only a little farther we have to sail. Look, look ahead there! It is only to beat just around that point yonder. Now—now! there is the peaceful, blissful haven and home full in view." By this time the audience was weeping, radiant with hope.

Even his isolated sentences are full of this imaginary realism. "Sailors ignorant!" he cried indignantly when one depreciated them; "sailors know everything; they grasp the world in their hand like an orange!" The boldness of this language is wonderful. Of superannuated ministers he said: "They are like camels bearing precious spices and browsing on bitter herbs. They were moral giants. When God made them he rolled his sleeves up to the arm-pits."

It was the activity of his brain, the realism of his imagery and the homely naturalness of his language that made some of his transitions abrupt to grotesqueness and some of his speech border startlingly on impropriety. He really thought aloud—which many a matter-of-fact, heavy speaker would find it unsafe to do. Dissociated from their context and from the earnestness and devout spirit of the man, they sound much worse than when uttered.

It was the combination of these two qualities also which made him extravagant in speech, erratic in sentiment, and inconsistent by himself. He was whatever he thought or imagined for the moment; his genius possessed and controlled him. Thus he was a radical temperance reformer, but he denounced prohibitory legislation and hurled ridicule at those who proposed the use of an unfermented wine in the sacrament; he called it "raisin water." Of rum-sellers he said: "I wonder that the angels in heaven do not tear up the golden pavements and throw them on their heads;" but he conjured those who should succeed him to "Cast out from this church, in my name, any man that comes up to the altar with his glue-pot and dye-stuff."

Dr. Jewett says: "I have heard him at times when I have been amazed at the utter inconsistency of his views, not only with any standard of doctrine recognized as sound by other men, but with his own public utterances of perhaps the week previous. His imagination, once fairly excited, could furnish in thirty minutes material for half-a-dozen speeches of an hour each; and, unfortunately, it frequently happened that different parts of the same speech could be used on opposite sides of the same question."

So he denounced the abolitionists and slavery in the same breath. "Before I would assist one of those Southern devils to catch a nigger," he shouted, after reading "Uncle Tom's Cabin," "I would see them all in hell, and I would shout hallelujah on to the end of it!" "You talk like a rabid abolitionist," said his interlocutor. "No," he cried, with even more vengeance; "no, I despise them. They have cursed the land!" He called Foster, the abolitionist orator, "a devil on the platform." His reverence for the church led him to consign summarily to a hotter climate those who came out on the anti-slavery issue; and he was a vehement advocate of church authority, and evangelical orthodoxy, yet the most of his life he preached for Unitarians; and he openly defied the mandate of the conference regarding Masonry, being a member of the fraternity, and he submitted to church discipline for his contumacy, but refused to withdraw from the order, and prayed in public for the anti-Masons, "O, Lord, make their hearts as soft as their heads are." Plainly, there was no managing such a tempestuous soul, and he was

left to go his own way. Honor be to the church that had the magnanimity and broad charity to let him do his own grand work in his own grand way. It was herein as grand and eccentric as an organization as he was among men.

His sarcasm, wit, terseness, and vigor of speech were the outcome of an energetic and picturesque mind, struggling with a limited vocabulary for its expression. His sentences were explosive. "This fast age," he said, "would be glad to put spurs to lightning, and blow a trumpet in the ears of thunder." Again, "Some people think they are saints. If they could see themselves as the just in glory see them they would n't dare to look a decent devil in the face." "If I owed the devil a hypocrite, and he wouldn't take that man for pay, I'd repudiate the debt." He called another minister, who had preceded him, and infringing on his allotted time, "As selfish as a whale who takes in a ton of herring before breakfast." Again, "It is a great mistake to think of converting the world without the help of sailors. You might as well think of melting a mountain of ice with a moonbeam, or of heating an oven with snow-balls." He called morality, without religion, "Starting a man to heaven with an icicle in his pocket." "I am not two inches off heaven!" he exclaimed, in a moment of religious exaltation. He said to Channing, the Unitarian: "When you die angels will fight for the honor of carrying you to heaven on their shoulders." "Sailors' hearts are big as an ox's; open like a sunflower, and they carry them in their right hands ready to give them away." One of his converts, gifted in prayer, he always called "Salvation-set-to-music." A colored brother, speaking with the simple pathos of his race, drew from Father Taylor the ejaculation, "There is rain in that cloud."

But, whether homely or lofty, whether pathetic or witty, he always talked in dead earnest out of his warm heart, out of his seething brain, and everything was gilded by the magic touch of imagination. "A man," says Stevens, "who could scarcely speak three sentences, in the pulpit or out of it, without presenting a striking poetic image, a phrase of rare beauty, or a sententious sarcasm, whose discourses presented the strangest, the most brilliant exhibition of sense, epigrammatic thought, pathos, and humor, spangled over by an exhaustless variety of the finest images and pervaded by a spiritual earnestness that subdued all listeners." "His splendid thoughts come faster than he can speak them," said Harriet Martineau, "and at times he could be totally overwhelmed by them if a burst of tears, of which he was wholly unconscious, did not aid in his relief." "I have seen a diamond shining," said Dr. Bartol, "but he was a diamond on fire."

3. *Sympathy.* Here was the secret of his power over men. His emotional nature constantly overflowed all else. With a marvelous intuition in reading character, a free-masonry with all phases of human emotions, a magnetism that put him inside of every heart, he became the better self, the ideal longing of each listener. It made no difference how learned or stoical the man was; Father Taylor got hold of him and stirred his heart from the bottom. A man of wit said, "I am always afraid when I am laughing at Father Taylor's wit, for I know he will make me cry before he has done with me." People cry and laugh alternately, and sometimes both together. Laughter is the best preparation for tears. "Man, thou pendulum betwixt a smile and tear." [Are we not all inconsistent, eccentric, at the bottom of our natures, *i. e.*, at our very best?] A New York comedian came to study the method of one of whose acting he had heard much report; he was so affected by the unlearned art of this master of the soul that he fairly blubbered behind his handkerchief.

Dr. Wentworth, of another occasion said: "The immense audience swayed in the wealth of his eloquence like a forest of willows. We laughed, we wept, we shouted in turns; and finally, finding myself getting utterly unmanned, and rapidly dissolving into tears and brine, I fled the pulpit and hid myself out of earshot of this extraordinary scene."

Dr. Wakely, of New York, describes the effects of a prayer by Father Taylor, at the New York Conference: "The ministers wept all over the house like little children. Dr. Capers and Dr. Pitman were in the pulpit with me. Dr. Capers wept and trembled exceedingly; and Dr. Pitman laughed and cried alternately—smiles and tears strangely blended."

"His pathos is the most awful of his powers," said Miss Martineau, terrified at his control over her emotions; "I have seen a single clause of a short sentence call up an instantaneous flush on hundreds of hard faces."

Many would not expose their hearts to hear him a second time; they could not bear the overmastering power.

Dr. Bartol very finely said: "What was the secret but a sympathy, raised to the highest power, so as to exceed all that we conceive under that name, so that *he saw out of people as well as into them!* He put on their eyes for his eyeglasses, looking at the world as they did, and they found and felt him in them at the core and center." "He was a master of pathos," said Dr. Bellows; "rough sailors and beautiful and cultivated Boston girls, and men like Webster and Emerson, and shop boys and Cambridge students, and Jenny Lind and Charles Dickens, and Harriet Martineau, and everybody of taste or curiosity who visited Boston were seen weeping together with Father Taylor. Ah, the human heart, down at the bottom, is one."

He loved all little children with all his Master's passion. The baptism of infants was always a baptism of joy and tears with him. He would gather one to his breast and kiss and croon over it like a mother. Taking a beautiful little girl in his arms, he raised her before the whole audience, and said, with streaming eyes, "Look at the sweet lamb! Her mother has brought her to Christ's fold. A baptism of heaven be on thee, my pretty dove." All children recognized him at sight for one of their guild. A ragged little girl walked into the church at his funeral, laid a buttonhole bouquet on the coffin, and said timidly and sweetly, "He was *my* friend," and so departed. Once when he had been called to several children's funerals in succession, he said to a friend whom he met in the street, "There is something wrong somewhere. There are storms brewing when so many doves are flying aloft."

At funerals he was a refuge of consolation. He so entered into the hearts bereaved that he felt their hurt. "Father, look upon us," he once implored, with mighty and tender supplication, "*we are a widow!*" "It is no wonder to me," said Harriet Martineau, "that the widow and orphan are cherished by those who hear his prayers for them."

Drunken sailors or abandoned women, none were left out of reach of his infinite sympathy; and it reached the uttermost parts of the earth. A sailor boy has died and been buried in South America, and he prays that the Comforter may be near the bereaved father "when his aged heart goes forth from his bosom to flutter around the far southern grave of his boy!" Is Shakspeare more dramatic, Shelly more imaginative, Longfellow more pathetic than this?

Out of this fathomless love he preached his gospel of happiness and purity and love; for it was doubtless true, as he declared, that "he never knew the time when he did not love God." Out of it came his sweet charity and tolerance. His lovers were of all denominations and of none—Catholics, Universalists, Unitarians—for he was "altogether lovely." When one at a camp-meeting excluded from salvation all these sects, all men who used tobacco and all women who wore jewelry, Father Taylor broke in indignantly, "If that's true, Christ's mission was a failure. It's a pity he came." "How far apart are heaven and hell?" he was asked. "I tell you," said he, "they are so near that myriads of souls to-day don't know which they are in." "Blessed Jesus," he prayed, "give us common sense, and let no man put blinkers on us, that we can only see in a certain direction; for we want to look all around the horizon—yea, to the highest heavens and to the lowest depths of the ocean." "When *Bigotry* is buried I hope I shall be at the fu-

neral," he said. His intimacy with the Unitarians, and his remarkable tribute to Channing have been cited. Of Emerson he said: "He has the sweetest soul God ever put into a man. If the devil gets him he will never know what to do with him." A theologian asked him what he was going to do with the Unitarians; "I don't know," he said, confidentially; "if they go to hell they'll *change the atmosphere.*" "Is your son-in-law a Christian?" asked a solicitous brother. "Not exactly," replied Father Taylor, "but he's a very sweet sinner."

4. *His humor.* This kept all cheerful, healthy and bright. He was a "laughing Christian." I do not think he ever used humor merely to make people laugh, but always with an earnest purpose back of it. He was no joker, and rarely thought his own keen thrusts subjects for merriment.

Of his manliness, his good sense, his improvidence, his sweet and beautiful home life, space does not suffice to speak.

If to be an original character among men is to be eccentric, Father Taylor was indeed odd. "He was in all things himself and not any one else; in this generation there has been but one Father Taylor," said Dr. Waterstone; and Dr. Bartol declared that, "No American citizen—Webster, Clay, Everett, Lincoln, Choate—has a reputation more impressive and unique." No one understood his singularity better than himself. "I will not wear a straight-jacket or Chinese shoes," he declared. Having been invited to lecture, he said: "I can't lecture; I would not lecture if I could. Your lectures are all macadamized; they are entertainments where those go who dare not visit the theater. I must cross-plow your fine paths. I am no man's model, no man's copyist, no man's agent; go on my own hook; say what I please, and you may help yourselves."

Like all greatly-eccentric souls, I presume, he felt his own isolation and want of comprehension of himself by others. One who sat far into the night in communion of soul with him, said: "You are a strange mortal!" "Well," said he, pathetically, "I have made up my mind there never was but one E. T. Taylor and, so far as I have anything to do with it, there never shall be another."

When we think of his birth, training, and surroundings—the child of the plantation and the graduate of the fore-castle—and contrast this with his peculiar powers, his strange career, and above all in rarity his wonderful world-wide mission, it is not too much to say that Father Taylor is without a parallel in American history. "An impulsive, untrained, and erratic genius;" there was a fixed purpose and a continuity of effort, such as is seen in few lives. If extravagant in speech and inconsistent in views, his intensity, vividness, and realism, make all sound like plain common-sense. Haughty and tender, imperious and democratic, grand and simple, splendidly uncultured; a strange, terrible power among men always used for leading, driving, persuading to righteousness. He deserves a paraphrase of a higher tribute than Phillips, the Irish barrister, gave to Napoleon. Such a medley of contradictions and at the same time such individual consistency for right were never before united in the same character. In the solitude of his originality, he was always the same mysterious, incomprehensible self—a man without a model and without a shadow.

"When I am dead," he pleaded, "I do not want to be buried in dirt. But bury me rather in the deep salt sea, where the coral rocks shall be my pillow, and the seaweeds shall be my winding-sheet, and the waves shall sing my requiem forever."

And it was not done. Conventionality triumphed in death over the old eccentric, who had defied it as long as he lived.

OBSERVE, the fates of men are balanced with wonderfully nice adjustments. The scale of this life, if it sinks, rises there, while if it rises here, it will sink to the ground there. What was here temporary affliction, will be there eternal triumph; what was here temporary triumph, will be there eternal and enduring despair.—*Schiller.*

C. L. S. C. WORK.

By Rev. J. H. VINCENT, D.D., SUPERINTENDENT OF INSTRUCTION C. L. S. C.

May the new year work be promptly begun, faithfully prosecuted, satisfactorily completed!

October 1 is Memorial Day—the day of the beginning of our college year. The bell at Chautauqua will ring at high noon. Listen for its echoes.

One member has already nearly finished two of the books since the meetings closed at Chautauqua. He read on the train; he read at the station; he read at the hotel; he read during the odd minutes at home. This is a good example.

The readings for October are: History of Greece,* vol. 2, by Prof. T. T. Timayenis, parts 7 and 8; Chautauqua Text-Books—No. 5, Greek History, by Dr. J. H. Vincent; Primer of American Literature, by C. F. Richardson; required readings in THE CHAUTAUQUAN.

Let the members of the Class of '83 who were not graduated in August, now begin to read up the required books, and be ready for graduation in 1884.

In the earliest announcement of the course of study for 1883-84, the little Chautauqua Text-Book No. 22, on Biology, was given. Many members suppose that this is the substitute for "Easy Lessons in Vegetable Biology," an altogether different book. The price of Chautauqua Text-Book No. 22 is 10 cents; the price of "Easy Lessons in Vegetable Biology" is (in the cheapest edition) 25 cents. If they will return to Phillips & Hunt, 805 Broadway, New York, the Chautauqua Text-Book and 15 cents additional, they will forward the "Easy Lessons in Vegetable Biology."

Students in the Class of 1887 should have Chautauqua Text-Books Nos. 4 and 5, English and Greek History. They have already been read by the other classes. Price, 10 cents each.

Members of the C. L. S. C. are earnestly urged to read Chautauqua Text-Book No. 24, Canadian History. This should have been required in the earlier lists.

All members of the C. L. S. C. should examine carefully the "Popular Education" circular which appears in this number of THE CHAUTAUQUAN, to ascertain if they have the complete list of books for the year.

By the payment of one dollar, all graduates of the C. L. S. C. will be entitled to all communications from the central office for four years, the four white crystal seals, and any additional white seals which they may gain. The one dollar does not, of course, pay for special seals.

The Chautauqua Hand-Book No. 2—known as the "Green Book"—which contains a full account of the C. L. S. C. work, is now ready. Send a two cent stamp to Miss K. F. Kimball, Plainfield, N. J., and you will receive a copy.

The Class of 1884 should send in their back reports as soon as possible. It is so much better to get all ready in advance, and not wait until the close of the year, when the general office is crowded, the secretaries busy, and mistakes easily possible.

* Students of the new class (1887) to be organized this fall, not having read volume 1 of Timayenis's History of Greece, will not be required to read volume 2, but, instead of volumes 1 and 2 of Timayenis's, will read "Brief History of Greece." Price, paper, 60 cents.

LOCAL CIRCLE NOTICE.

The full accounts of the C. L. S. C. commencement exercises at the summer Assemblies, which we publish this month, take the place of the reports from the local circles. It is only for this month, however. The department will continue to be a regular feature of the magazine. These reports have been of great service to local circles everywhere, and we earnestly request that full and exact accounts of work should be forwarded us by the president or secretary of each local circle. Let any new feature in the program be fully described; give us all the new plans for social work, give everything that will be suggestive and helpful. Several times last year we were asked how to work up a new circle, or to revive a dying one. Where leaders have had experience in building up these circles let them give testimony through the "Local Circle" column. It may help others in similar circumstances. The new and helpful features are what we want for this department. If the members will co-operate, the local circle reports will be very useful.

OUTLINE OF C. L. S. C. STUDIES.

OCTOBER, 1883.

The required readings for October are:

Parts 7 and 8 of the second volume of Timayenis's "History of Greece" for students having read the first volume, but for students of class 1887 the first ninety-one pages of "Brief History of Greece."

Chautauqua Text-book, No. 5, "Greek History," by Dr. J. H. Vincent.

"Primer of American Literature," by C. F. Richardson.

Readings in THE CHAUTAUQUAN.

The division is as follows:

First Week (ending October 8)—1. The first three chapters of part 7 of Timayenis's "History of Greece;" or from page 1 to "Age of Pericles," page 23, in "Brief History of Greece."

2. American Literature, the first two chapters.

3. Readings in American Literature in THE CHAUTAUQUAN.

4. Sunday Readings, in THE CHAUTAUQUAN, selection for October 7.

Second Week (ending October 16)—1. Timayenis's "History of Greece," from chapter iv., part 7, to chapter ii, part 8, or in "Brief History of Greece," from "The Age of Pericles," page 23, to "The Civilization," page 46.

2. American Literature, from page 30 to page 55, inclusive.

3. Readings in Physical Science in THE CHAUTAUQUAN.

4. Sunday Readings, in THE CHAUTAUQUAN, selection for October 14.

Third Week (ending October 24)—1. "History of Greece" (Timayenis's) from chapter ii., page 73, to chapter vi., page 115, or in "Brief History of Greece," from page 46, "The Civilization," to "Manners and Customs," page 71.

2. American Literature, from page 56, section 34, to page 81.

3. Readings in THE CHAUTAUQUAN on German History and Political Economy.

4. Sunday Readings, in THE CHAUTAUQUAN, selection for October 21.

Fourth Week (ending October 31)—1. "History of Greece." Finish part eighth, or in "Brief History of Greece," from page 71, "Manners and Customs," to "Readings in Greek History," page 91.

2. American Literature, from section 34, page 81, to end of volume.

3. Readings in Art, in THE CHAUTAUQUAN.

4. Sunday Readings, in THE CHAUTAUQUAN, for October 28.

POPULAR EDUCATION.

CHAUTAUQUA LITERARY AND SCIENTIFIC CIRCLE.

President—Lewis Miller.
Superintendent of Instruction—J. H. Vincent, D.D.
Counselors—Lyman Abbott, D.D.; J. M. Gibson, D.D.; Bishop H. W. Warren, D.D.; W. C. Wilkinson, D.D.
Office Secretary—Miss Kate F. Kimball.
General Secretary—A. M. Martin.

I.—AIM.

This new organization aims to promote habits of reading and study in nature, art, science, and in secular and sacred literature, in connection with the routine of daily life (especially among those whose educational advantages have been limited), so as to secure to them the college student's general outlook upon the world and life, and to develop the habit of close, connected, persistent thinking.

2.—METHODS.

It proposes to encourage individual study in lines and by text-books which shall be indicated; by local circles for mutual help and encouragement in such studies; by summer courses of lectures and "students' sessions" at Chautauqua, and by written reports and examinations.

3.—COURSE OF STUDY.

The course of study prescribed by the C. L. S. C. shall cover a period of four years

4.—ARRANGEMENT OF CLASSES.

Each year's Course of Study will be considered the "First Year" for new pupils whether it be the first, second, third, or fourth of the four years' course. For example, "the class of 1887," instead of beginning October, 1883, with the same studies which were pursued in 1882-83 by "the class of 1886," will fall in with "the class of '86," and take for their first year the second year's course of the '86 class. The first year for "the class of 1886" will thus in due time become the fourth year for "the class of 1887."

5.—C. L. S. C. COURSE OF READING, 1883-84

I. REQUIRED.

History of Greece.* By Prof. T. T. Timayenis. Vol. 2; parts 7, 8, 10 and 11. Price, \$1.15.
Stories in English History by the Great Historians. Edited by C. E. Bishop, Esq. Price, \$1.
Chautauqua Text-Books.—No. 16, Roman History; No. 24, Canadian History; No. 21, American History; No. 5, Greek History. Price, 10 cents each.
Preparatory Latin Course in English. By Dr. W. C. Wilkinson. Price, \$1.
Chautauqua Text-Books.—No. 23, English Literature. By Prof. J. H. Gilmore. Price, 10 cents.
Primer of American Literature. By C. F. Richardson. Price, 30 cents.
Biographical Stories by Hawthorne. Price, 15 cents.
How to Get Strong and How to Stay So. By W. Blaikie. Price, cloth, 80 cents; paper, 50 cents.
Easy Lessons in Vegetable Biology. By Dr. J. H. Wythe. Price, cloth, 40 cents; paper, 25 cents.
Philosophy of the Plan of Salvation. By J. B. Walker. Price, cloth, \$1; paper, 50 cts.
Chautauqua Text-Books.—No. 18, Christian Evidences; No. 39, Sunday-School Normal Class Work; No. 43, Good Manners; No. 4, English History. Price, 10 cents each.
THE CHAUTAUQUAN, price, \$1.50, in which will be published:
 Sunday Readings. Selected by Dr. J. H. Vincent.
 Readings in Commercial Law. By Edwin C. Reynolds, Esq.
 Readings in Political Economy. By Prof. George M. Steele, D.D.
 Readings in French History and Literature. By Dr. J. H. Vincent.
 Studies in American History and Literature. By A. M. Martin, Esq.
THE CHAUTAUQUAN will also contain, in the department of Required Readings, brief papers, as follows:
 Readings in German History and Literature.
 Readings in Roman History.
 Readings in American Literature.
 Readings about the Arts, Artists, and their Masterpieces.
 Readings in Physical Science.

ADDITIONAL READINGS FOR STUDENTS OF THE CLASS OF 1884.

Hints for Home Reading. By Dr. Lyman Abbott. Price, cloth, \$1; boards, 75 cts.
The Hall in the Grove. By Mrs. Alden. (A Story of Chautauqua and the C. L. S. C.) Price, \$1.50.
Outline Study of Man. By Dr. Mark Hopkins. Price, \$1.50.

II. FOR THE WHITE SEAL.

Persons who pursue the "White Seal Course" of each year, in addition to the regular course, will receive at the time of their graduation a white seal for each year, to be attached to the regular diploma.
History of Greece.* By Prof. T. T. Timayenis. Vol. 2. Completed. Price, \$1.15.
Chautauqua Library of English History and Literature. Vol. 2. Price, cloth, 50 cents; paper, 35 cents.
Church History. By Dr. Blackburn. Price, \$2.25.
Bacon's Essays. Price, \$1.25.

III. REQUIRED.—FOR THE WHITE (CRYSTAL) SEAL FOR GRADUATES OF '82 AND '83.

For the benefit of graduates of the C. L. S. C. who, being members of local circles wish to continue in the same general line of reading as undergraduate members, a White Crystal Seal Course is prepared. This consists mainly of books belonging to the current year's study, but not previously read by the graduates. An additional white seal is also offered to the graduates, the books for which are specified under paragraph 4. Some of these books were in the first four year's course, and are therefore to be re-read. The payment of one dollar at one time entitles a graduate to the White Crystal and White Seals for four years. If only fifty cents is paid, it will be credited for but one year.

THE CHAUTAUQUAN. Required Reading.
History of Greece.* By Prof. T. T. Timayenis. Vol. 2. Completed. Price, \$1.15.
Preparatory Latin Course in English. By Dr. W. C. Wilkinson. Price, \$1.
Credo. By Dr. L. T. Townsend. Price, \$1.
Bacon's Essays. Price, \$1.25.

IV. REQUIRED.—FOR ADDITIONAL WHITE SEAL FOR GRADUATES OF '82 AND '83.

Brief History of Greece. By J. Dorman Steele. Price, 60 cents.
Stories in English History by the Great Historians. Edited by C. E. Bishop. Price, \$1.
Easy Lessons in Vegetable Biology. By Dr. J. H. Wythe. Price, cloth, 40 cents; paper, 25 cents.
Biographical Stories. By Nathaniel Hawthorne. Price, 15 cents.
How to Get Strong and How to Stay So. By W. Blaikie. Price, cloth, 80 cents; paper, 50 cents.
Philosophy of the Plan of Salvation. By J. B. Walker. Price, cloth, \$1; paper, 50 cts.
Primer of American Literature. By C. F. Richardson. Price, 30 cents.
Chautauqua Text-Books. Nos. 4, 5, 16, 18, 21, 23, 39 and 43. Price, each, 10 cents.

*Students of the new class (1887) to be organized this fall, and graduates of the classes of 1882 and 1883, not having read volume 1 of Timayenis's History of Greece, will not be required to read volume 2, but instead of volume 2 of Timayenis's, will read "Brief History of Greece." Price, paper, 60 cts.

The following is the distribution of the books and readings through the year:

October.

History of Greece.* Vol. 2. By Prof. T. T. Timayenis. Parts 7 and 8.
Chautauqua Text-Books.—No. 5, Greek History. By Dr. J. H. Vincent.
Primer of American Literature. By C. F. Richardson.
Required Readings in THE CHAUTAUQUAN

November.

History of Greece.* Vol. 2. By Prof. T. T. Timayenis. Parts 10 and 11.
Chautauqua Text-Books.—No. 5, Greek History. By Dr. J. H. Vincent.
Required Readings in THE CHAUTAUQUAN

December.

Easy Lessons in Vegetable Biology. By Dr. J. H. Wythe.
Biographical Stories. By Nathaniel Hawthorne.
Required Readings in THE CHAUTAUQUAN

January.

Philosophy of the Plan of Salvation. By J. B. Walker. 14 chapters.
Chautauqua Text-Books.—No. 18, Christian Evidences. By Dr. J. H. Vincent.
Chautauqua Text-Books.—No. 39, Sunday School Normal Class Work.
Required Readings in THE CHAUTAUQUAN

February.

Philosophy of the Plan of Salvation. By J. B. Walker. Completed.

6.—SPECIAL COURSES.

Members of the C. L. S. C. may take, in addition to the regular course above prescribed, one or more special courses, and pass an examination upon them. Pupils will receive credit and testimonial seals to be appended to the regular diploma, according to the merit of examinations on these supplemental courses.

7.—THE PREPARATORY COURSE.

Persons who are too young, or not sufficiently advanced in their studies to take the regular C. L. S. C. course, may adopt certain preparatory lessons for one or more years.

For circulars of the preparatory course, address Miss K. F. KIMBALL, Plainfield, New Jersey.

8.—INITIATION FEE.

To defray the expenses of correspondence, memoranda, etc., an annual fee of fifty cents is required. This amount should be forwarded to Miss K. F. Kimball, Plainfield, N. J., (by New York or Philadelphia draft, Post-office order on Plainfield, N. J., or the new Postal Note, to be ready about September 1.) Do not send postage stamps if you can possibly avoid it. Three-cent stamps will not be received.
 N. B.—In sending your fee, be sure to state to which class you belong, whether 1884, 1885, 1886, or 1887.

9.—APPLICATION FOR MEMBERSHIP.

Persons desiring to unite with the C. L. S. C. should forward answers to the following questions to Miss K. F. KIMBALL, PLAINFIELD, N. J. The class graduating in 1887 should begin the study of the lessons required October, 1883. They may begin as late as January 1, 1884.

1. Give your name in full.
2. Your post-office address, with county and State.
3. Are you married or single?
4. What is your age? Are you between twenty and thirty, or thirty and forty, or forty and fifty, or fifty and sixty, etc.?
5. If married, how many children living under the age of sixteen years?
6. What is your occupation?
7. With what religious denomination are you connected?
8. Do you, after mature deliberation, resolve, if able, to prosecute the four years' course of study presented by the C. L. S. C.?
9. Do you promise, if practicable, to give an average of four hours a week to the reading and study required by this course?
10. How much more than the time specified do you hope to give to this course of study?

10.—TIME REQUIRED.

An average of forty minutes' reading each week-day will enable the student in nine months to complete the books required for the year. More time than this will probably be spent by many persons, and for their accommodation a special course of reading on the same subjects has been indicated. The habit of thinking steadily upon worthy themes during one's secular toil will lighten labor, brighten life, and develop power.

11.—MEMORANDA.

The annual "examinations" will be held at the homes of the members, and in writing. Duplicate Memoranda are forwarded, one copy being retained by each student and the other filled out and forwarded to the office at Plainfield, N. J.

12.—ATTENDANCE AT CHAUTAUQUA.

Persons should be present to enjoy the annual meetings at Chautauqua, but attendance there is not necessary to graduation in the C. L. S. C. Persons who have never visited Chautauqua may enjoy the advantages, diploma, and honors of the "Circle."

13.—MISCELLANEOUS.

For the history of the C. L. S. C., an explanation of the LOCAL CIRCLES, the MEMORIAL DAYS to be observed by all true C. L. S. C. members, ST. PAUL'S GROVE at Chautauqua, etc., etc., address (inclose two-cent stamp) Miss K. F. KIMBALL, Plainfield, N. J., who will forward the "Chautauqua Hand-Book, No. 2," sixty-four pages. Blank forms, containing the ten questions given in paragraph 9, will also be sent on application.

14.—CHAUTAUQUA PERIODICALS.

THE CHAUTAUQUAN, organ of the C. L. S. C.; 76 pages; ten numbers; \$1.50 per year. **CHAUTAUQUA ASSEMBLY DAILY HERALD**, organ of Chautauqua meetings; 8 pages; 48 columns. Daily in August; 10 numbers. Contains the lectures delivered at Chautauqua; \$1 per volume. Both periodicals one year, \$2.50. Address Dr. Theodore L. Flood, Editor and Proprietor, Meadville, Pa.

15.—BOOKS OF THE C. L. S. C.

For all the books address Phillips & Hunt, New York, or Walden & Stowe, Cincinnati or Chicago.

*Students of the new class (1887) to be organized this fall, not having read volume 1 of Timayenis's History of Greece, will not be required to read volume 2, but instead of volume 2, of Timayenis's, will read "Brief History of Greece." Price, paper, 60 cts.

†We ask this question to ascertain the possible future intellectual and moral influence of this "Circle" on your homes.

[Not required.]

QUESTIONS AND ANSWERS.

By A. M. MARTIN, GENERAL SECRETARY C. L. S. C.

I.—ONE HUNDRED QUESTIONS AND ANSWERS ON "HISTORY OF GREECE," VOL. II., PARTS SEVENTH AND EIGHTH—THEBAN SUPREMACY, AND MACEDONIAN HELLENISM.

1. Q. What was the character of the Thebans in the fifth and fourth centuries before Christ? A. They were brave soldiers, and possessed souls, if not always noble, yet ever resolute; bodies, if not prepossessing, yet athletic and well prepared, by exercise and thorough drill from early childhood, for every military duty.

2. Q. What two names are permanently associated with the rise of Theban power? A. Epaminondas and Pelopidas.

3. Q. What was the training and what some of the striking characteristics of Epaminondas? A. He was trained from early youth in all the branches of gymnastics and military duty; was distinguished by the diligent care he took of his intellectual education; was modest and wholly devoid of a boasting spirit, and was indifferent to money.

4. Q. What did Epaminondas, with Pelopidas, organize that filled Hellas with the fame of its achievements, and fell only when the autonomy of Hellas disappeared? A. The famous lochos, or band, composed of three hundred picked men, bound together by the closest ties of friendship, and devoted to each other to the death.

5. Q. What was the effect upon the Spartans of the war against the Thebans, the latter being assisted by the Athenians, during the first part of the fourth century before Christ? A. The Spartans were daily losing their prestige and becoming humbled.

6. Q. What was the most noted of the combats of the Thebans with the Lacedæmonians in Boeotia at this time, which served as a sort of prelude to that of Leuktra? A. The battle of Tegyra, in which the Thebans, led by Pelopidas, achieved a splendid victory.

7. Q. What disastrous visitations heightened the despondency of the Spartans in 372 B. C.? A. The terrible earthquakes and rains which during that year occurred in the Peloponnesus, and which they regarded as tokens of the wrath of the god Poseidon.

8. Q. What was the result of the Athenians having established their new naval dominion on the Ionian Sea? A. They had no longer ground on which to continue the war, and they therefore sent to Sparta for peace.

9. Q. What was the result of the congress of the Hellenic nation which followed in the year 371 B. C.? A. Agesilaus, on behalf of Sparta, caused the names of the Thebans to be struck from the roll, and declared war against them upon the spot.

10. Q. What celebrated battle was fought soon after in Boeotia between the Lacedæmonians and the Thebans? A. The battle of Leuktra.

11. Q. Previous to this time how had Hellenic armies been drawn up in order of battle? A. In parallel lines.

12. Q. What plan did Epaminondas adopt on this occasion? A. He massed upon the center a greater force than his opponent, and concentrated a superior number upon the right wing.

13. Q. What is said of the adoption of this arrangement of the forces of an army afterward by military leaders? A. It was afterward largely adopted by military leaders, and by its successful application some of the greatest battles of the world have been gained by such generals as Frederick of Prussia and Napoleon.

14. Q. What was the result at the battle of Leuktra? A. The right wing of the Spartans was completely driven back to their camp, and the remainder of the army sought safety by retreat.

15. Q. Following immediately upon the defeat at Leuktra what occurred in the Peloponnesus? A. A great revolution broke out against Sparta.

16. Q. What movement was next undertaken by Epaminondas? A. He invaded the Peloponnesus with the Thebans and their allies, and approached almost to the very gates of Sparta.

17. Q. What is said of the appearance of an enemy before Sparta? A. Full six hundred years had elapsed since the first establishment of the Dorians in Lacedæmon, and this was the first time in all that long period that they had seen an enemy in their territory.

18. Q. What two enterprises did Epaminondas now execute which had formed the special purpose of his expedition? A. The re-establishment of Messenia and the consolidation of the Arkadians.

19. Q. Within what space of time had this complete change of affairs occurred in the Peloponnesus? A. Within a space of eighteen months from the time the Thebans were insultingly driven from the national congress by Sparta.

20. Q. On the north what conquest was made by Pelopidas about the same time? A. He invaded Thessaly, and subdued the greater part of the country.

21. Q. What were the terms of the permanent league into which the two states of Athens and Sparta now entered? A. That the command both on land and sea should alternate between Athens and Sparta for periods of five days.

22. Q. Notwithstanding this league what was the ruling city in Hellas? A. Thebes.

23. Q. What countries in Greece acknowledged Thebes as ruler and obeyed her? A. Macedonia, Thessaly, most of the countries between Thermopylæ and the isthmus, and most of the Peloponnesus.

24. Q. About the end of the year 368 B. C., what battle was fought between the Spartans and Arkadians during the absence of Epaminondas from the Peloponnesus? A. What the Spartans called "The Tearless Battle."

25. Q. What does Diodorus say of the slain? A. Ten thousand men were slain, without the loss of a single Lacedæmonian.

26. Q. At the instance of Pelopidas, in 366 B. C., what declaration was made by the Persian king in regard to Thebes? A. Thebes was declared the head city of Hellas, and any city refusing to admit her leadership was menaced with instant compulsion by Persian force.

27. Q. How was this declaration received by the allies of Thebes? A. They collectively refused to adhere to the royal decree.

28. Q. What occurred to Pelopidas while in the execution of his duty as envoy to Thessaly in his efforts to have the supremacy of Thebes there recognized? A. He was seized and detained as prisoner by Alexander of Pheræ.

29. Q. After he had been released through the efforts of Epaminondas, what was the result of an engagement of the forces of Pelopidas with those of Alexander of Thessaly? A. The army of Alexander was routed at the battle of Kynos Kephalæ, but Pelopidas was slain.

30. Q. About the middle of 362 B. C., for what purpose did Epaminondas march again into the Peloponnesus? A. In order to strengthen the adherents of the Thebans and to put down their numerous opponents.

31. Q. What celebrated battle was fought between the forces under Epaminondas and the allied army opposed? A. The battle of Mantinea.

32. Q. What was the result of the engagement? A. The whole army in opposition to Epaminondas was driven from the field.

33. Q. What was the fate of Epaminondas? A. He received a wound in the breast from the thrust of a spear which proved mortal.

34. Q. What is the character of the opinions that have been uniformly expressed, both in ancient and modern times concerning Epaminondas? A. There has ever been for him only praise and admiration.

35. Q. After he fell what prevailed for twenty-five years in Greece? A. Political anarchy, ending only in the Macedonian supremacy.

36. Q. Following the advice of Epaminondas what did the Thebans at once do after the battle of Mantinea? A. They made peace with the enemy.

37. Q. Where did the Spartan king, Agesilaus, soon after die? A. On the march toward home from Egypt, where he unsuccessfully attempted an expedition against the Persian empire.

38. Q. What three islands and city revolted from Athens and her confederacy which led to the three years' "social war" from 358 to 355 B. C.? A. The islands of Chios, Kos and Rhodes, and the city of Byzantium.

39. Q. What war was carried on in Greece for the ten years from 355 to 346 B. C.? A. The second Sacred War.

40. Q. During this war what desecration was committed by the Phokian general Philomelus? A. The sanctuary of the Delphian temple was seized and robbed of its treasures.

41. Q. What noted king of Macedonia first took part in Hellenic affairs during the second Sacred War? A. Philip.

42. Q. What was the result of an engagement by the forces of Philip with the Phokians? A. He became master of Thessaly, and proclaimed himself the avenger of the Delphian god, and the defender of the insulted Hellenic religion.

43. Q. By whom was the advance of Philip into Hellas repelled? A. By the Athenians, who occupied Thermopylae in opposition to Philip.

44. Q. What renowned orator attempted to arouse the Athenians to oppose the advance of Philip in his efforts to reduce all Hellas to his sway? A. Demosthenes.

45. Q. Where does the criticism of the modern world and that of the grandest orators of France and England unanimously place Demosthenes? A. At the head of orators.

46. Q. By what name are the most famous of the orations of Demosthenes known? A. The Philipics.

47. Q. What decisive battle was fought in 338 B. C. between the Macedonian army and the Athenians and their allies? A. The battle of Chæroneia.

48. Q. What was the result of this battle? A. The Greeks were conquered, and the Sacred Band of the Thebans to a man fell in this battle as they stood in a solid phalanx, not one of the three hundred yielding a foot.

49. Q. To whom was the chief credit of this victory due? A. To the youthful Alexander, the son of Philip.

50. Q. At a congress of Hellenic cities Philip soon after convened at Corinth to what position was he chosen? A. General-in-chief of all Hellas.

51. Q. What was the geographical position of Macedonia before its enlargement through the conquests of Philip? A. It was an exclusively inland country lying between two mountain ranges on the north side of the great Kambunian chain.

52. Q. What is said of the language of the Macedonians? A. It was widely different from that of the Thracians on the east and the Illyrians on the west, and was so nearly akin to the Hellenic that the latter tongue was easily acquired by them.

53. Q. In the earliest times how were the inhabitants of Macedonia divided? A. Into a variety of independent tribes, each of which had its own king or chieftain.

54. Q. According to tradition who were the real founders of the greatness of Macedonia? A. Fugitives from Hellas, belonging to the royal Herakleid line of Argos, who are supposed to have arrived in the country during the seventh century before Christ.

55. Q. Who was the first Macedonian sovereign of real historic importance? A. Amyntas.

56. Q. Mention three other sovereigns of Macedonia before Philip? A. Alexander, Perdikkas, and Archelaus.

57. Q. Who was the father of Philip? A. Amyntas II.

58. Q. What mode of life did the immediate predecessors of

Philip seek as much as possible to approach? A. The Attic mode of life.

59. Q. What is said in regard to King Archelaus? A. That he introduced many social improvements after Hellenic models, and was much attached to the youthful Plato and his teacher Sokrates.

60. Q. At the age of fifteen where was Philip taken as a hostage? A. To Thebes.

61. Q. How long did he remain there? A. Three years.

62. Q. Though a hostage how was he welcomed? A. He was honorably and cordially welcomed, received a scientific and oratorical training, and studied philosophy.

63. Q. Almost from the beginning of his reign what income did Philip receive from the gold-producing regions of Mount Pangæus? A. According to Diodorus a yearly income of one thousand talents.

64. Q. How did this income compare with that received by the Athenians and the Spartans? A. It was greater than that which the Athenians and the Spartans obtained in the very acme of their power.

65. Q. What steps did Philip take to make his army more efficient? A. He reorganized the army and effected a complete transformation in their armament and accomplishments.

66. Q. What was the most formidable part of the army as organized by Philip? A. The Macedonian phalanx.

67. Q. What was the principal weapon of the soldiers serving in the phalanx? A. A long pike called the sarissa, twenty-one feet in length.

68. Q. After his return from Corinth in 337 B. C. what did Philip do in regard to the invasion of Asia? A. He made so many preparations for his intended expedition into Asia that he exhausted his accumulated treasures.

69. Q. What steps did he take in the spring of 336 B. C. to begin hostilities against the Persians? A. He sent to Asia a portion of the Macedonian army, under Parmenio and Attalus, to begin hostilities at once until he assumed command of the expedition.

70. Q. What was the result of a quarrel that occurred about this time between Philip and one of his wives, Olympias, the mother of Alexander? A. Olympias went to her brother, the King of Epirus, and Alexander soon followed her, and expressed strong resentment at the treatment of his mother.

71. Q. In what way did Philip seek to reconcile the parties to this quarrel, and at the same time ally himself to the King of Epirus? A. By giving the King of Epirus his daughter by Olympias, Kleopatra, in marriage.

72. Q. How were the nuptials celebrated? A. With many splendid and costly entertainments.

73. Q. During the festivities how did Philip come to his death? A. As he was walking toward the door of the theater he was suddenly assassinated by Pausanias, one of the body-guard of the king.

74. Q. At what age did Philip die, and how long was his reign? A. He died at the age of forty-seven, after a reign of twenty-three years.

75. Q. Who succeeded him to the throne? A. His son, Alexander the Great.

76. Q. When was Alexander born? A. In July, 356 B. C.

77. Q. What is said of Alexander and the Iliad? A. One of the first books that he read was the Iliad, to which he became devotedly attached, and a copy of which, corrected, as it is said, by Aristotle, he carried with him in his military campaigns.

78. Q. What was the effect of the reception of the news of the death of Philip at Athens and elsewhere? A. There was an outbreak, caused especially by Demosthenes, who represented his death as holding forth new hopes of freedom to the city. There was also much disturbance in other Hellenic cities.

79. Q. When Alexander was informed of this crisis of affairs what steps did he take? A. He hastened to Hellas with a con

siderable army, reaching there within two months of the death of his father.

80. Q. What action was taken by a common council of the Greeks that Alexander assembled at Corinth? A. The council gave him, as it had done to Philip two years before, the hegemony of the expedition against Asia. The Lacedæmonians alone stood aloof, refusing all concurrence.

81. Q. After his return to Macedonia, where did Alexander next go to secure his domains? A. Into Thrace and bordering regions where he subdued the tribes and brought them under his subjection.

82. Q. In the meantime what Hellenic city revolted from the rule of Alexander? A. Thebes.

83. Q. What followed Alexander's immediate march from the north to Thebes? A. The city was taken after a desperate resistance, six thousand of the inhabitants slain, thirty thousand sold into slavery, and the houses leveled to the ground.

84. Q. Upon his return to Macedonia what did Alexander institute? A. Magnificent sacrifices to the gods, and scenic contests in honor of the god Zeus and the Muses.

85. Q. Who was now upon the throne of the Persian empire? A. Darius Codomannus.

86. Q. When did Alexander commence his invasion of Asia? A. In the year 334 B. C.

87. Q. What was the size of the Macedonian army that Alexander led into Asia? A. Thirty thousand infantry and forty-five hundred cavalry.

88. Q. Where did he first encounter the Persian army? A. At the river Granicus.

89. Q. What was the result of the engagement that followed? A. The army of Alexander forced the passage of the river in the face of the enemy and entirely routed the Persian forces.

90. Q. What followed Alexander's march through Asia Minor? A. Many cities surrendered without opposition, and the others he reached he subdued.

91. Q. As he was marching further into Asia, who now advanced to meet Alexander? A. Darius himself with an immense army equipped in great splendor.

92. Q. Where did the hostile armies encounter each other? A. On the plains of Issus.

93. Q. What was the result of the battle there fought? A. The Persians were completely routed with great loss, and Darius saved himself only by precipitate flight.

94. Q. What two cities refused to submit to Alexander, and were taken by him only after prolonged sieges? A. Tyre and Gaza.

95. Q. Into what country did Alexander next march, and what great commercial city did he there found? A. Into Egypt, where he founded Alexandria.

96. Q. Where did Alexander again encounter the Persian army, and with what results? A. On the plains of Arbela, eastward of the Tigris. The immense army of the Persians was either cut to pieces, captured, or dispersed, and no subsequent attempt was made to gather together a large regular force.

97. Q. What two great capitals of Persia now surrendered to Alexander without a struggle? A. Babylon and Susa.

98. Q. Into what region did Alexander further extend his conquests? A. Into India.

99. Q. Upon his return from India, when and where did Alexander die? A. At Babylon in the year 323 B. C.

100. Q. What became of the countries subdued by Alexander after his death? A. The empire was subjected to protracted civil wars, and was subsequently separated into numerous small kingdoms.

II.—FIFTY QUESTIONS AND ANSWERS ON AMERICAN LITERATURE.

1. Q. As soon as the English colonists landed on American shores, at Jamestown and Plymouth, for what purpose did they begin to think of the establishment of schools of sound learning? A. In Virginia, for the purpose of educating the Indians,

and in Massachusetts Bay for the supply of church pastors.

2. Q. Until politics began to interest the colonists in a vital manner, what formed the bulk of the issues of the press? A. Religious books and tracts.

3. Q. What was the first book written and printed in New England? A. The Bay Psalm Book.

4. Q. Of all the theological writers of the seventeenth and eighteenth centuries, who were the most voluminous? A. Increase Mather and his son Cotton. The publications of the former numbered eighty-five, and of the latter no less than three hundred and eighty-two.

5. Q. What is the chief monument of the industry and scholarship of John Eliot, the "Apostle to the Indians?" A. His translation of the entire Bible into the Indian tongue. This appeared in two parts, the New Testament in 1661, and the whole Bible in 1663, and was the labor of the unaided Eliot.

6. Q. What are the names of three minor writers of the seventeenth century? A. Capt. John Smith, Gov. John Winthrop, and Michael Wigglesworth.

7. Q. Upon what work does the reputation of Jonathan Edwards as philosopher and theologian chiefly rest? A. His great treatise on the "Freedom of the Will," written about the middle of the eighteenth century.

8. Q. Who were the principal leaders in the eighteenth century of the school of philosophy which Edwards shaped? A. Samuel Hopkins, Nathaniel Emmons and Timothy Dwight.

9. Q. What is one of the most remarkable of the names of great Americans in the eighteenth century? A. Benjamin Franklin, who was a master in whatever branch of learning he touched.

10. Q. What is one of the best known of Franklin's works? A. Poor Richard's Almanac.

11. Q. What are the names of three minor writers of the eighteenth century? A. William Stith, David Brainerd and John Woolman.

12. Q. Of what character was a large part of the books and pamphlets written during the revolutionary period? A. It was necessarily of temporary interest, and of little value as literature.

13. Q. In what particular did George Washington excel as a writer? A. As a letter writer.

14. Q. What are some of the most noted productions of Thomas Jefferson? A. Notes on Virginia, his Correspondence, and the Declaration of Independence.

15. Q. What was the Federalist? A. It was a collection of essays published periodically, and arguing in favor of the Constitution of the United States adopted in 1789, and was the concerted work of Alexander Hamilton, James Madison and John Jay.

16. Q. What work of Thomas Paine has always had a wide circulation chiefly among the lower classes? A. The Age of Reason. It advocates a pure deism, but its method of criticism and temper of attack are now generally repudiated by more scholarly writers of the same school.

17. Q. Who was the first American poet to attain eminence? A. Philip Freneau, a Huguenot by descent and a New Yorker by birth.

18. Q. Who was the first American novelist and what was his first work? A. Charles Brockden Brown, and his first work called "Wieland" was printed in 1798.

19. Q. For what are the histories written during the last century chiefly useful? A. As authorities for later writers.

20. Q. Who were two biographical writers of the last century? A. William Wirt, who wrote a readable life of Patrick Henry, and Chief Justice John Marshall, who prepared a standard life of Washington.

21. Q. What was incident to the beginning of the present century being marked by a considerable controversial excitement among the New England clergy? A. The spread of Unitarian views in and around Boston.

22. Q. Who were the Unitarian leaders in this controversy? A. William Ellery Channing, the Henry Wares, father and son, and Andrew Norton.

23. Q. By whom were the conservative Congregationalists championed? A. By Noah Worcester, of Salem, and Moses Stewart and Leonard Woods, professors in the theological seminary at Andover.

24. Q. What is the principal theological work that has appeared since Edward's famous treatise? A. The "Systematic Theology" of Charles Hodge, professor in Princeton Seminary.

25. Q. What two college presidents have devoted much thought and ability to mental science? A. Mark Hopkins, of Williams, and Noah Porter, of Yale.

26. Q. What two names are prominent in the literature of Church history? A. Dr. Philip Schaff and Prof. W. G. T. Shedd.

27. Q. To whom is the term "the Knickerbocker writers" applied? A. To certain authors who began to write soon after the beginning of the century, who were for the most part residents of New York, and who were in some cases descendants of the old Dutch stock.

28. Q. What are the names of four prominent writers included under this head? A. Washington Irving, James Kirke Paulding, Joseph Rodman Drake, and Fitz-Greene Halleck.

29. Q. What are the names of five poets made celebrated by single pieces? A. Francis Scott Key, Samuel Woodworth, John Howard Payne, Albert G. Greene, and William Augustus Muhlenberg.

30. Q. What are the titles of the pieces for which they are celebrated? A. "The Star Spangled Banner," "The Old Oaken Bucket," "Home, Sweet Home," "Old Grimes is Dead," and "I would not live away."

31. Q. What eminent name connected the earlier and later days of our literature? A. William Cullen Bryant.

32. Q. Who are termed the five great American poets? A. William Cullen Bryant, Henry Wadsworth Longfellow, John Greenleaf Whittier, Oliver Wendell Holmes, and James Russell Lowell.

33. Q. Who was an entirely original figure in American literature? A. Edgar Allen Poe.

34. Q. What are the names of ten persons prominent as orators during the present century? A. Webster, Calhoun, Clay, Everett, Choate, Seward, Sumner, Winthrop, Garrison, and Phillips.

35. Q. What are the names of five prominent American his-

torians of the present century? A. Richard Hildreth, George Bancroft, John G. Palfrey, William H. Prescott, and John Lothrop Motley.

36. Q. What three names are eminent in the literature of Arctic travel? A. Elisha Kent Kane, Charles F. Hall, and Isaac I. Hayes.

37. Q. Who was the first writer of American fiction whose works were extensively read? A. James Fenimore Cooper.

38. Q. What American author has James Russell Lowell called the greatest imaginative writer since Shakspeare? A. Nathaniel Hawthorne.

39. Q. What work has had the greatest success of any American book? A. Harriet Beecher Stowe's "Uncle Tom's Cabin," a novel directed against slavery. Between five and six hundred thousand copies have been sold in this country alone, and it has been forty times translated.

40. Q. Who is the most distinguished of American essayists? A. Ralph Waldo Emerson.

41. Q. Give the chief among standard editions of Shakspeare that have been edited in this country? A. Those of Richard Grant White and Horace Howard Furness.

42. Q. Who are the authors of three notable histories of the late civil war? A. Horace Greeley, Alexander H. Stephens, and Dr. John W. Draper.

43. Q. What recent American author attained eminence as a writer of travels, of novels, and as a poet? A. Bayard Taylor.

44. Q. What two poets are the chief American kindred of the English pre-Raphaelites? A. Walt Whitman and Joaquin Miller; but their kinship is one of nature and not of imitation.

45. Q. Who was the originator of a popular dialect poetry of the time, which has found a troop of imitators? A. John Hay.

46. Q. What author has found a special field in novels of pioneer life in the uncivilized outposts of Western civilization? A. Edward Eggleston.

47. Q. Who is called the best of American writers of juveniles? A. Louisa May Alcott.

48. Q. Give the names of three prominent humorists. A. Charles Farrar Browne, Henry W. Shaw, and David R. Locke.

49. Q. What American writer has devoted the greater part of his literary life to the production of biographies? A. James Parton.

50. Q. Who has enjoyed the acquaintance of more English and American authors than any other of our writers? A. James T. Fields.

EDITOR'S OUTLOOK.

THE TENTH ASSEMBLY.

Ten years ago the First Assembly offered to the world the Chautauqua Idea. It promised an almost ideal summer life, where health and thought and brotherly love should abound. Ten years have passed, and now the question is, has the scheme been carried out? Is the Assembly a practical idea, and is it a permanency? The answers are most decided. The original plan has not only been put into practice, but, when enlarged an hundred fold, has been proven practicable. Is it a permanency may be a harder question, but the tenth Assembly has, we believe, in many ways proven it so. First, the character and growth of all departments of Chautauqua work show them to be needed institutions, and necessary institutions, as a rule, become permanent. The steady, healthy growth of the different branches of work shows how enduring is the Idea; the Normal department increased its alumni this year to over 1,200; its plans for future work are much more elaborate than ever before, its course of study much superior. The annual report from the School of Languages shows a steady increase. Over

two hundred full tickets were sold in the school this year, and twenty-six different states were represented.

The Teachers' Retreat for 1883 shows a great increase over previous years:

In 1879 there were enrolled 15 members.

In 1880 there were enrolled 133 members.

In 1881 there were enrolled 105 members.

In 1882 there were enrolled 76 members.

In 1883 there were enrolled 223 members.

The C. L. S. C. has reached the enormous membership of nearly 50,000. Besides the advance in the different schools, the attendance at the Assembly was unprecedented. In the earlier years of an institution this might mean very little—a boom, and nothing more—but in the tenth year, when the place has become well-known, it does mean a great deal. These people, too, were not all new friends. Chautauqua has been able to keep its old friends, while every season it has added hosts of new ones. The whole exterior showed it. When streets are lighted by the electric light, and houses are built on stone foun-

dations, lathed and plastered, and furnished with modern improvements, a town has reached a period of durability. Things are built to stay. Chautauqua puts up no more shanties. It has become a city, not of a day but for all time.

The genuine hearty enthusiasm which animates the workers and friends of the movement is, to us, a most excellent reason for believing the institution lasting. There is a feeling among many that enthusiasm is a weakness, a quality not exactly in good form, not in keeping with cultured minds. This is a mistake. Enthusiasm, combined with good sense and industry, is the best equipment for any enterprise. As Emerson says, "A man is at his best when enthusiastic," and we believe Chautauqua is most successful when most enthusiastic—most sure of permanence because capable of always inspiring others with enduring enthusiasm.

The great Assembly opens its doors to every one, but few realize the real value of the idea, or appreciate the conditions of society which make feasible such an idea. Said an eminent German, after having studied the Assembly thoroughly: "You Americans do not appreciate this wonderful plant of yours. In my country we could not have a Chautauqua; no other country under the sun could support such an institution. It is peculiarly American." We do not appreciate the Idea. It is too ideal for the practical minds of the day. But though we may not grasp its full meaning, the Tenth Assembly has proven that people are beginning to understand the practicability, the breadth, and the permanence of the Chautauqua Idea.

THE C. L. S. C. AN EDUCATIONAL NECESSITY OF THE TIMES.

Necessity is a word which in its use depends on circumstances. What is necessary to a people in one age may not have been to their ancestors a generation earlier. Time was when the masses of men were not required to act with intelligence of their own, but to follow the decree of the privileged few or obey the behest of the autocratic individual. Illustrations of such a state of society remain. They are to be found wherever the autocracy or oligarchy, whether political or ecclesiastical, continues its sway.

Under such conditions it is easily seen that the only education required is obedience, blind and unquestioning. All that goes beyond this only makes the individual unhappy and embarrasses authority. Hence, since her ambition has been absolute power, the wisdom of that favorite motto of the Romish church, "keep the people in ignorance," a motto which she has done her best to put in practice.

But our age and civilization have fallen upon other conditions. Obedience is still required, and indeed ever must be, but it is no longer with eyes tight shut, but open; and we are not only encouraged, but by the very conditions of society, are required to ask questions concerning the very grounds of obedience. Something has taken the place of infallible Church and infallible State. That something is enlightened conscience and educated judgment.

In this country the corner-stone of whose stability and permanence must rest on obedience born of intellectual and moral enlightenment, some things have become, and daily are becoming more and more apparent. It is apparent that universal education of a certain kind, a kind that includes to no small degree both head and heart, must go with universal suffrage. It is neither treason nor heresy to say that in the light of experience and of the signs of the times, neither our common schools on the one hand, nor our academies, colleges and universities on the other, are competent to meet and provide for all the educational needs of the American people. Too much can not be said in praise of these institutions. They have been the conservators of our national ideas in the past. But we are growing, and citizenship means higher responsibilities and higher obligations than aforetime. The common school which fits a man for the transactions of ordinary business and pre-

pare the foundation for a higher development, does a great work; but the man who settles down to life without further inspiration and opportunity can hardly be fitted for the higher work and duties of the home and society. Whence then comes, or can come, this inspiration and better preparation? Thus far in our history it has come through the seminary and college. But it is evident that not more than one in twenty of the American youth can have these higher advantages. Reduce the expense to the minimum and there are still insurmountable barriers in the way. It needs no argument, therefore, to show that an organization with the plans, aims and methods of the *Chautauqua Literary and Scientific Circle* has a mission which bears the sanction of necessity. The wide gap between the common school and the college must be filled, and only can be filled by that which brings the means of education to the home; to the youth learning his trade, to the man or woman in the midst of daily duties and employments. The demand is for that which will fill the atmosphere about life with aspiration and the spirit of inquiry. It is for that which will furnish suggestions, a plan and a guide to lead the inquiring mind. Precisely this is the C. L. S. C. Here is its mission and here its necessity—and the necessity likewise of all kindred similar organizations which are yet to spring up and follow in her course.

THE SHAKSPERE CONTROVERSY.

It is strange how sometimes an opinion altogether untenable, which some one has broached, is taken up by others, and comes in time to be accepted as true by a considerable number. It was some twenty-five years ago that a Miss Delia Bacon published an elaborate argument whose end was to show that not William Shakspeare, but Lord Francis Bacon, was the author of the immortal plays which bear the former's name. She first gave her discovery—unquestionably of the highest importance, if correct—to the world in a magazine article; but afterward embodied it in quite a large volume, to which Nathaniel Hawthorne wrote an introduction, though he did not accept the writer's theory. This was the beginning of a controversy which is still alive. Perhaps the number has never been very large of those who believe that the glory of Shakspeare belongs to Bacon; but there have always been some to entertain the preposterous notion, from Miss Bacon to Mrs. Henry Pott.

The latter lady has recently issued a book which has excited some interest. The title—somewhat drawn out—is, "The Promus of Formularies and Elegancies (being private notes, circa 1594, hitherto unpublished) of Francis Bacon, illustrated and elucidated by passages from Shakspeare." Mrs. Pott's undertaking is one more in the line of Miss Delia Bacon. By a comparison of the Bacon notes, in forms of expression and thought, with passages of the Shakspeare tragedies and comedies, she endeavors to verify the theory that the great English philosopher—author of the "Novum Organum," and characterized by Pope as "the greatest, wisest, and meanest of mankind"—is also author of the works accorded to the Bard of Avon. That she succeeds in her task she herself evidently entertains no doubt, but probably not many will agree with her. She finds correspondences and similarities in passages compared where her readers will try in vain to find them; and it is putting the matter mildly to say that her undertaking is a great failure.

Considerable ingenuity and much enthusiasm have been shown by advocates of the theory which makes Lord Bacon the author of the works of Shakspeare; but the theory is an absurd one, with nothing whatever to support it. The internal evidence, contained in the works of the two authors, not only gives the theory no support, but is alone enough to a sane mind completely to demolish it. The whole cast of Bacon's mind, as shown by his known writings, was as unlike as it could be to that of the person who wrote the Shakspeare dramas and sonnets. And what other evidence is adduced by those who would have us transfer to another the laurels of the man who was eas-

ily the greatest mind in all literature? None whatever. The truth is, it is the improbability from the nature of the case—or, as some would say, the impossibility—that such a person as William Shakspeare, the son of a Stratford yeoman, with limited educational opportunities, whose youth was by no means promising, should have produced the works to which for two centuries his name has been attached, which is at the bottom of the theory which gives the authorship to another. This, and nothing else, originated the idea, and keeps it alive. We are told that to believe in Shakspeare as the author of these works, universally acknowledged as unapproached and unapproachable, is to believe a miracle. "Whence hath this man this wisdom?" it is asked, as was asked of the Divine Man; and we are re-

minded that the stream never rises higher than the fountain. Shakspeare could not have produced the works—the power was not in him, it is reasoned, but the wise Bacon might have done it; therefore people search for the wherewithal to substantiate an assumption giving the authorship to the latter. But we must believe the miracle; there is no escape. Did Milton write the "Paradise Lost," and Lord Bacon the "Novum Organum?" Is the Iliad the work of Homer? It is just as certain that the Shakspeare writings were the offspring of Shakspeare's genius. We admit the marvel, but there is no setting aside of the fact. And when we are asked to explain how this man could have acquired the power to produce these prodigies of human genius, we can only say, the Maker gave it to him.

EDITOR'S NOTE-BOOK.

The C. L. S. C. received special attention at the summer Assemblies. By referring to the reports published elsewhere in this number, our readers will learn how the Chautauqua spirit spreads, and how the organization is being strengthened in all parts of the land.

Recent Presidents of the United States have shown their taste for recreation very positively. Ex-President Grant was fond of good horses and rapid driving; ex-President Hayes visited colleges during the commencement season, and loved his farm as a quiet retreat; President Arthur turns from his arduous labors to the rod and line and long journeys, such as he has made to Florida and the West during the past year.

We can supply complete sets of the CHAUTAUQUA ASSEMBLY DAILY HERALD for 1883, for \$1.00, postage paid by us. Also complete sets of THE CHAUTAUQUAN of volume two and three.

Prophecies are numerous from newspaper men as to who will be the candidates for the presidency in 1884. Ex-Secretary Blaine is reported as having turned his attention to literature, and announces that he is not a candidate; Mr. Tilden has retired to the privacy of Gramercy Park; ex-Secretary Windom, it is said by the wise ones, went out of the succession when he failed of a re-election to the Senate. Reports are rife in influential political circles that the Secretary of War is likely to be one of his martyred fathers' successors, but time alone will show us the true successor.

THE CHAUTAUQUAN opens the fourth volume in a new dress. Our printer does the work on copper-faced type, prepared with especial reference to the neat and attractive typographical appearance of the magazine.

Mr. A. M. Sullivan, in a recent number of the *Nineteenth Century*, discusses "Irish Emigration as a remedy for Irish troubles in Ireland." He says: "Of the group of dynamite conspirators who stood in the dock at Newgate the other day—men whose frightful purpose was to bury London in ruins—not one was born on Irish soil. All were the sons or grandsons of men swept away from 'congested districts,' and sent or driven to America 'for the good of those who went, and of those who were left behind.' Whoever has recently traveled in America must have been struck with the fact that animosity toward England often displays itself more strongly in the second and third generations of Irish Americans than in the men who were actually driven forth."

The present administration is not all-powerful in a certain kind of its political movements. The Secretary of the Treasury, Mr. Folger, was defeated for Governor of New York in the

election last fall, and recently Mr. Chandler, Secretary of the Navy, failed of an election to the United States Senate in the New Hampshire Legislature.

Chautauqua grows in favor with the public. The Ohio State Teacher's Association held their annual convention there in July last, and with social gatherings, lectures, and discussions on live questions, in the educational world, they made it an interesting and profitable session. The Pennsylvania State Teacher's Association will hold their convocation at Chautauqua Lake for 1884. It is an endorsement of Chautauqua when large bodies of educators go from their own States into another to hold their most important gatherings. The National Teacher's Association met at this center once, and the Ohio people have been there twice. It is this sort of gatherings that the Chautauqua authorities are especially pleased to welcome to the parks, public buildings, and all the privileges of the classic groves.

The Royal Humane Society, in its recently issued report, gives the following advice to swimmers and bathers: "Avoid bathing within two hours after a meal. Avoid bathing when exhausted by fatigue, or from any other cause. Avoid bathing when the body is cooling after perspiration. Avoid bathing altogether in the open air if, after having been a short time in the water, it causes a sense of chilliness with numbness of the hands and feet. Bathe when the body is warm, provided no time is lost in getting into the water. Avoid chilling the body by sitting or standing undressed on the banks or in boats after having been in the water. Avoid remaining too long in the water; leave the water immediately if there is the slightest feeling of chilliness."

The West promises to set a good example to the East in more than one question of morals. The case deserving of mention now is where Governor Crittenden, of Missouri, and Governor Glick, of Kansas, and their Attorney-Generals, notified the two prize-fighters, Slade and Mitchell, that even training for a prize-fight would send them to the State prison. This so alarmed them that they quit the United States and went to Mexico. The laws of the older States are as severe on this brutal practice as those of Missouri and Kansas, but the laxity in the enforcement of the laws is the only license that prize-fighters find to justify their training in New York, Boston, and other old cities. Some of our authorities could profitably "go West" to study how to enforce civil law.

Dr. John Roche, an English physician who has had remarkable experiences, gives as his conclusion that cholera is purely and simply a specific fever, only inferior in its ravages to yellow fever, and closely allied to it. Cholera has a period of incubation varying from two to fourteen days; prone to attack the enervated and those subject to depression from any cause. It

is contagious, and liable to occur periodically about every ten years in some parts of India. It seems to have visited the British Isles about every sixteen years, and as the period has elapsed since the last outbreak, it is more than likely to occur this year. Those persons who indulge in no enervating habits, and take nothing internally which would arrest the secretions nor too drastically stimulate them, and partake of nothing which is highly fermentable, may safely feel that they are cholera-proof during an epidemic.

"The Old South Lectures for Young People" is a pleasing and successful plan for teaching the History of America. Lectures are held Wednesday afternoon at the "Old South Meeting House," Boston, and the subjects illustrate well the tenor of the meeting. Thus for September the topics are "Franklin," "How to Study American History," "The Year 1777," "History in the Boston Streets."

In the C. L. S. C. Commencement report the Lutheran has been omitted from the list of denominations represented in the class of '83.

On Sunday, the ninth day of September, the steamship "Nevada" landed 682 Mormons at New York, being the fourth company that has been brought over this year. H. H. Evans, the secretary, said that there were in the company 269 British, 106 Swiss and Germans, 284 Scandinavians, and 23 returning missionaries. "Every emigrant," he added, "paid his or her passage over. No aid is afforded them by the Mormon Church. The majority have a little money with them, enough to establish themselves in America. They will locate in sixteen towns in Utah. All we do is to protect them while traveling from Liverpool to Utah. Some of these immigrants have been years laying up money to pay their passage to this country." One of the Mormon immigrants did not go through to Utah. Her name is Regina Andersen. She is a Swedish woman, spinster, thirty-five years of age, and is afflicted with blindness. Her brother Leander and her sister Anna, who live in Philadelphia, had heard of her intention to go to Utah and were at Castle Garden to intercept her before the "Nevada" arrived. They insisted upon talking with their blind sister, and soon succeeded in persuading her to abandon the Mormon proselytes and prepare to go with her relatives to Philadelphia. The Mormon missionaries were strongly opposed to the woman leaving the party, but the matter was brought before Superintendent Jackson, and the woman was permitted to go to Philadelphia with her brother. She had prepaid her passage to Salt Lake and did not receive her money back. In conversation with a reporter the woman appeared not to know anything about the peculiar institution of the Mormon Church—polygamy. Congress could quite as consistently, and with better results to the country, enact a law to prevent this kind of emigration, than the one they have leveled against the Chinese. Why not meet Mormonism at New York harbor and prevent this infamous traffic in human lives?

The Rev. Henry A. Powell, in his Congregational church in Williamsburg, on a Sunday in September discussed "The sorrows of the Free Thinkers as revealed at their recent convention," from this suggestive text: "The show of their countenances doth witness against them." He stated that over their platform were hung the pictures of Thomas Paine, R. G. Ingersoll, and D. M. Bennett—Paine author of a book against the Bible—Ingersoll, dispenser of blasphemy—Bennett, who not long since served a term in the penitentiary for sending foul literature through the mails. "How much better than such visionary wanderings is the old story of a living Father in heaven, of a Savior who suffered on the cross, and angel visitants to lead us from the life mortal to the life immortal."

We call the attention of our readers to the notice elsewhere in this number of the "Chautauqua School of Languages," the

different departments of which are to be organized into schools of correspondence, so that students may, at their homes, study Hebrew, German, French, etc., by corresponding with competent teachers. This is a rare opportunity for members of the C. L. S. C., or any others who desire, to study the languages, but are denied the privileges of the schools. Next month we shall introduce the "Normal Work" into THE CHAUTAUQUAN, in a few initial chapters, from the pens of Rev. Dr. Hurlbut and Prof. R. S. Holmes, and thus extend to our readers through the year the privilege of pursuing this course, which is a main feature of the summer assemblies.

The telegraph operators have by their strike provoked a general discussion in the press of the telegraph system of the country, besides exciting the attention of Postmaster-General Gresham, who promises to discuss in his annual report to Congress the practicability of the general government assuming control of all telegraph lines as it does of the postal service. It ought to work as well in the United States as it does in England. Mr. Fawcett, Postmaster-General of Great Britain, reports that "the number of telegraph messages sent in the United Kingdom during the last year was 32,092,026." Mr. Fawcett says that it has been decided that as soon as the necessary increase of plant can be made, the minimum charge for inland telegrams will be reduced from 24 to 12 cents.

A correspondent says, under date of September 9: "The last spike on the Northern Pacific Road was driven this afternoon on the Pacific slope of the Rocky Mountains, 2,500 miles from the Atlantic Ocean, and 800 miles from the Pacific, and 91 years after the idea of a highway from the Lakes to the Pacific was first suggested by Thomas Jefferson."

Analogous to the Normal Class Bible work of the Chautauqua University is a new movement in Russia. An organization called the *Stundists* bind themselves to devote an hour (*stunde*) every day to the study of the Bible. "The society has grown to immense proportions, and is said to have reclaimed whole villages from drunkenness and crime.

Keshub Chunder Sen, the famous leader of the Brahmo Somaj, is about to visit Europe and America again, to preach a new development of faith, in which Hinduism and Christianity are to be combined. Little good, we fear, will result from the Baboo's advocacy of an eclectic system; for his adherents will be content to stop in that dim twilight instead of advancing into the full glory of the divine day. The teaching of the leader himself seems latterly to have degenerated into ceremonialism, and he attributes marvelous influence to external things; while some of his followers are giving themselves up with the wildest enthusiasm to perfect a sacred dance of a complex kind, organized with rotating rings of participants dressed in garbs of varied hue. All this mummery is a sad disappointment for those who hoped that Chunder Sen might destroy heathenism besides purifying it.

The Louisville *Courier* of August 9, referring to the great Exposition, speaks thus of one of the exhibitions: "Last night the electric railway was in operation, and the locomotive with two cars attached made the tour of the park. To-day it will be running constantly, and visitors will see what is the latest achievement of science. It is an event of extraordinary interest. It is the practical demonstration of the power of electricity applied as a motor. Without fire or smoke, with no visible agent to propel it, moved by an unseen and even as yet an almost unknown influence, it follows the path marked out with all the celerity and certainty demanded by the most cautious and practical."

The directors of the Western Union Telegraph Company have made a concession to their employes by issuing the following

order: "Commencing to-day (September 1), seven and a half hours actual service in this office during week nights will constitute a day's work, or, in other words, the hours of the night force will be from 5:30 p. m. till 1:30 a. m., allowing thirty minutes for lunch. Sunday service will be paid for the same as other over-time services, at the rate of one-seventh of a day's pay for each hour. All payments for over-time, including Sunday service, or for a fractional part of a month, will be based upon the number of week days in the month.'

Professor Bell is reported as saying in a recent conversation that there are more than 500,000 telephones in use in the United States, and the manufacturers are unable to supply the demand so as to keep abreast of orders. He said that the progress of the telephone would have been greater but for the opposition of the telegraph companies, who regarded it as, in part, a competitor instead of an ally. In other countries the telegraph companies had very generally adopted the telephone as an auxiliary, especially at city branch offices and at small offices in the country.

Lord Chief Justice Coleridge, of England, is in this country, a guest of the American bar. English judges may be aristocrats, but they are generally above corruption. It is to be hoped that American ideas of judicial dignity and honor will be raised by what they may observe in this chief of the English bench.

Not a few Americans were astonished at the display of local manufactures which Ireland exhibited in the Boston "Foreign Art and Industrial Exhibition." Among the objects were bogwood ornaments, hair ornaments, furniture, marbles, sculpture, etc. The variety of work suggests that in the not distant future

the distressed country will have manufactures and arts to employ its people. Its resources are particularly fitted to certain arts. Thus few countries boast so great a variety of marbles; its clay is particularly suitable for modeling: osiers grow readily on its soil, and the natural woods are incomparably fine. With these industries developed, and a system of railroads through the country, much would be done toward settling the Irish question.

When a woman marries, and learns that in the race of life she is better qualified to earn the family living than her husband, it will be helpful to have a precedent at hand by which to govern her husband. Here is one, taken from the communication of a successful working woman to a Boston exchange. She says: "I am a milliner, and have made between \$1,500 and \$2,500 a year in my business for some time past. I married four years ago. My husband is kind and good looking, but he never learned any trade, had no profession and could not average \$500 a year. I loved him, however, but I saw that it would not do to depend upon him, so I kept on with my business. After a time I think he got a little lazy, and as we were both away during the day, we could not keep house and got sick of boarding. Finally I proposed that he should keep house and I would run the business and find the money. We have now lived very happily in this way for two years. My husband rises and builds the fire, gets breakfast, and I leave at 7:45 for my place of business. He does the washing, ironing, and cleaning, and I do not know of any woman who can beat him. He is as neat as wax, and can cook equal to any one in town. It may be an isolated case, but I think the time has now come when women who have husbands to support should make them do the work; otherwise they are luxuries we must do without."

EDITOR'S TABLE.

Q. What is the meaning of boycotting?

A. Boycott was the name of an Irish landlord whose tenants refused to gather his crops, and endeavored to prevent his doing it. To withhold help and patronage, or in any way to obstruct or hinder the business of another—a meanness that is despicable—is to treat him as the tenants treated Mr. Boycott.

Q. Was General Grant the author of the expression, "We have met the enemy and they are ours?"

A. The above is very like to Cæsar's "*veni, vidi, vici*," and as a general's report of a great victory just won, is remarkable for its comprehensive brevity. The words, though in harmony with the character and sayings of General Grant, were not, if used, original with him, but should be credited to Commodore Perry.

Q. Why was the son of Edward III. called the Black Prince?
A. Because of his black armor.

Q. Was Alexander of Macedon, who informed the Greeks before the battle of Platea of the intended attack, their ally?

A. Not openly; but secretly he was, or the information would not have been given.

Q. Where is the mountain lake Shawangunk?

A. The Shawangunk (Shon-gum) mountain is properly a continuation of the Appalachian, or Allegheny chain in New York. Like the Adirondacks and Catskills, south of the Mohawk, also outliers of the chain, it seems separated by intervening lands of lower elevation, and the relationship is shown by similarity of the geological formation. Look for the lake in the same region. It is probably small, and may not be found on most maps.

Q. Was it not Leonidas who, before the battle of Thermopy-

læ, said, "The Persians are so numerous that their arrows will darken the sun?"

A. No. Those words may intimate fear of the overwhelming force of the enemy, and the Greek historian does not mention their author, but says that on hearing them, a brave Spartan replied: "All the better, as we will then fight in the shade."

Q. Which construction? "Thus were music and poetry born in the same family, and we shall notice how that they have clung to each other, or "how they have clung?"

A. The latter is preferred. The conjunctive particle is not needed, and though occasionally thus used by a good writer, only encumbers the sentence.

Q. Who was Caius Cestius?

A. A wealthy Roman citizen of the Augustan age, a client of Cicero, of not much distinction, though rich. A part of his estate was employed in building for him a fine mausoleum, which remains to the present day, though most of the contemporaneous surrounding structures have long been in ruins. Near it lie the ashes of Keats and Shelly. After the death of Keats, Shelly wrote of his friend: "He lies in the lovely, romantic cemetery of the Protestants of Rome, near the tomb of Caius Cestius, and within the mossy walls and towns, now mouldering and desolate, which formed the circuit of ancient Rome. The cemetery is an open space among the ruins, covered in winter with violets and daisies. It might make one in love with death to think of being buried in so sweet a place."

Q. Can you give the date of Mrs. Browning's birth in 1809?

A. We can not. No records now at hand give the day or month. It is not best to be greatly troubled over our want of information on the subject, as it is quite safe to conclude she was "well born" some time during the year mentioned. Many

other eminent writers have gone into history with the same uncertainty as to the day of their birth.

Q. In whose hands was the government of the United States from 1783 to 1789?

A. Nominally in the Continental Congress—a kind of quasi central government. Practically in the hands of the colonists and their legislators. The war was ended and the United States acknowledged a free, sovereign, and independent nation. But they were, as yet, united only by the “articles of confederation” adopted in 1778; a bond of union that was soon found inadequate to secure a strong, permanent government amidst the perils that threatened the new republic. The regulation of commerce, the adjustment of difficulties between States, and the public defense were not sufficiently provided for. Congress could devise and recommend measures, but had little power to legislate, even on subjects that concerned the whole. There was still more need of an efficient executive department. Feeling that the articles of confederation were, in the changed state of the country, no longer sufficient, the leading statesmen wisely framed, and the country adopted the American Constitution, giving us a strong central government, with the least possible surrender of rights by the States thus united.

Q. Was there any reason for calling Alexander the Great a Greek?

A. Alexander was not a Greek, though educated by Greek teachers, and, as other Macedonians, using the Greek language. Macedon was not a part of Greece, but held Greece as a dependency, and used her power in expelling the Persians.

Q. After the confusion of tongues and the dispersion of mankind, into what families lingual were they divided?

A. Into *Shemetic*, *Hametic*, and *Japhetic*. The descendants of Shem peopled central Asia, particularly the parts about the Euphrates. The dialect or language called Aramaic prevailed in their northern and northeastern territory, the Arabic in their southern, and in their central and western the Hebrew. These are cognate languages, and profitably studied in connection. The descendants of Japheth spread over Europe and the north-west of Asia. Those of Ham occupied the southern part of the globe, particularly Africa. The languages spoken in these sections, respectively, may also be grouped together, and, however different, give evidence of a common origin. The general division into the above three classes has been found convenient, though the patronymics are used only to indicate remote origin and kinship.

C. L. S. C. NOTES ON REQUIRED READINGS FOR OCTOBER.

HISTORY OF GREECE.

Instead of indicating the sounds of the vowels in the Greek and Latin names given in the notes, we follow the plan of Webster's Unabridged Dictionary, giving rules for pronouncing the vowels and consonants. As the two principal marks (˘) are in Greek and Latin used differently from what they are in English, indicating the *quantity* instead of *quality*, it will be found less confusing to adopt this method.

RULES FOR THE VOWELS.

1. Any vowel at the end of an accented syllable, and *e*, *o*, and *u*, at the end of an unaccented syllable, have the long English sound.
2. *A*, ending an unaccented syllable, has the sound of *a* in *father*, or in *last*.
3. *I*, ending a final syllable, has the long sound. At the end of an initial unaccented syllable it varies between *i* long and *i* short (like *i* in *pin*). In all other cases *i*, ending an unaccented syllable, is short.
4. *Y* is like *i* in the same situation.
5. *Æ* and *æ* like *e* in the same situation.
6. If a syllable end in a consonant the vowel has the short English sound.
7. *E*, in final *es*, like *e* in *Andes*.

RULES FOR CONSONANTS.

1. *C*, before *e*, *i*, *y*, *æ*, *α*, is pronounced like *s*; before *a*, *o*, and *u*, and before consonants, like *k*.
2. *G*, before *e*, *i*, *y*, *æ*, and *α*, or another *g* followed by *e*, has the sound of *j*; before *a*, *o* and *u*, and consonants other than *g*, the hard sound.
3. *Ch* is like *k*, but is silent before a mute at the beginning of a word.
4. Initial *x* is like *z*.
5. *T*, *s*, and *c*, before *ia*, *iz*, *ii*, *io*, *iv*, and *ev*, preceded immediately by the accent, change into *sh* and *zh*; but when the *t* follows *s*, *t*, or *z*, or when the accent falls on the first of the vowels following, the consonant preserves its pure sound.
6. Initial *ph*, before a mute, is silent.
- P. 1—“Autonomy,” au-tón’o-my. The word is formed from the Greek words for *law* and *self* and means a law unto one’s self, or self-government.
- P. 1—“Koroneia” or Coronea, cor’o-ni’a.
- P. 2—“Antalkidas,” an-tal’ci-das.
- P. 2—“Phœbidas,” phœb’j-das. A Lacedæmonian of whom nothing of importance is known save his part in the seizure of Thebes. Phœbidas was slain in battle by the Thebans in 378.
- P. 2—“Leontiades,” le-on-ti’a-des; “Ismenias,” is-me’ni-as; “Pelopidas,” pe-lop’i-das; “Mellon,” mel’lon; “Charon,” ka’ron; “Gorgias,” gor’gi-as; “The’o-pom’pus.”
- P. 3—“Hegemony,” he-gém’o-ny. Leadership. Formed from the Greek word for guide or leader.
- P. 3—“Polymnis,” po-lym’nis.

P. 3—“Sparti,” spar’ti; the sown-men. The dragon from which these ancestors of the Theban patricians sprung guarded a well near the site of the Cadmeia. The men whom Cadmus had sent there to draw water had been killed by the monster, and in return Cadmus had slain it, sowing its teeth as Minerva advised. Fearing the armed men which sprang forth he caused a quarrel among them, in which all but five were slain.

P. 3—“Kadmus,” cad’mus. The mythical founder of Thebes, the son of a king of Phœnicia and the brother of Europa.

P. 3—“Simmias,” sim’mi-as. The two principal speakers, besides Socrates, in Plato’s “Phædon” are Simmias and his brother.

P. 3—“Tarentine,” ta-ren’tine; “Spin’ta-rus.”

P. 3—“Grote.” (1794-1871.) An English historian, famous chiefly for his History of Greece.

P. 4—“Lysis,” ly’sis. An eminent philosopher driven out of Italy about 510 B. C., during the persecution of the Pythagorean club. He spent the remainder of his life in Thebes, where he was held in the greatest honor.

P. 4—“Pythagorean Brotherhood,” pyth’a-gō’re-an. See p. 119, Vol. I, Timayenis. As a political and social power the brotherhood died out before the death of Pythagoras, though the sect still lived and kept up their religious observances.

P. 4—“Kadmeia,” cad-me’a.

P. 5—“Polybius,” po-lyb’i-us. (204-122 B. C.) A Grecian historian.

P. 6—“Leuktra,” luke’tra; “Mantineia,” man’ti-nei’a; “Megalopolis,” meg’a-lop’o-lis; “Kleombrotus,” kle-om’bro-tus; “Agesilaus,” a-ges-i-la’us; “Kithæron,” ci-thæ’ron; “Naxos,” nax’os; “Chabrias,” cha’bri-as.

P. 7—“Timotheus,” ti-mo’the-us. The son of the famous general Conon.

P. 7—“Tegyra,” te-gy’ra; “Harmost,” har’most; “Orchomenus,” or-chom’e-nus; “Polemarch,” pól’e-march.

P. 8—“Chæroneia,” chæ’ro-ne’a.

P. 8—“Eurotas,” eu-ro’tas. The largest river of Laconia.

P. 9—“Zacynthus,” za-cyn’tus. Now Zante; called by Homer the “Woody Zacynthus.”

P. 9—“Korkyra,” cor-cy’ra. Now the island of Corfu, one of the Ionian islands belonging to the nomarchy Corfu of the kingdom of Greece.

P. 9—“Periplus,” pēr’i-plūs. A rare word from the Greek, meaning to sail around a sea or coast.

P. 9—“Iphikrates,” i-phic’ra-tes.

P. 9—“Poseidon,” po-si’don. The Neptune of Roman mythology, the god of the sea.

- P. 9—"Helike," hel'i-ce; "Bu'ra."
- P. 10—"Kallias," cal'li-as. An Athenian family famous through several generations for its wealth.
- P. 10—"Autokles," au'to-cles; "Kallistratus," cal-lis'tra-tus.
- P. 10—"Boeotarch," bæ-o'tarch. One of the chief civil officers of Boeotia.
- P. 10—"Xenophon," xen'o-phon.
- P. 11—"Philo-Laonian." Friendly to Laconia.
- P. 12—"Ephors," ef'or.
- P. 14—"Helikon," hel'i-con.
- P. 14—"Kopais," cop'a-is. The largest lake of Greece.
- P. 14—"Kreusis," creu'sis. The harbor of the city of Thespiæ.
- P. 14—"Krissæan," cris-sæ'an; "Thespiæ," thes'pi-æ.
- P. 16—"Deimon," dei'mon; "Sphodrias," spho'dri-as.
- P. 16—"Kleonimus," cle-on'y-mus. The dearest friend of Archidamus, the son of Agesilaus.
- P. 17—"Ægospotami," æ'gos-pot'a-mi.
- P. 17—"Peiræus," pi-ræ'us. The principal harbor of Athens, situated about five miles southwest of the city.
- P. 18—"Archidamus," ar-chi-da'mus.
- P. 18—"Pheræ." A city of Thessaly, the site of the modern Velesino.
- P. 18—"Ægosthena," æ-gos'the-na.
- P. 19—"Aristotle," ar'is-to-tle.
- P. 19—"Epiknemidian," e-pic'ne-mid'ian; "O-pun'tian." The inhabitants of Eastern Locris were divided into two tribes: the Locri Epicnemidii, inhabiting the northern and the Locri Opuntii the southern part.
- P. 20—"Panarkadian," pan-ar-ca'di-an. Belonging to all Arcadia.
- P. 20—"Tegea," te'ge-a; "He-ræ'a."
- P. 21—"Dorians," do'ri-ans; "Lacedæmon," lac'e-dæ'mon; "Kephissus," ce-phi'sus. There are four rivers in Greece which bore this name. *One the chief river of Boeotia, two in Attica (one of which is its chief river, and the one here referred to), and a fourth in Argolis.
- P. 22—"Phliasiens," phli-a'si-ans; "Helots," he'lots, or hel'ots; "Kinadon," cin'a-don.
- P. 22—"Perieci," per-i-æ'ci. From the same derivation we have the word "perieciens," or "perieciens," meaning those who dwell on the opposite side of the globe, in the same parallel of latitude.
- P. 22—"Ithome," i-tho'me. A strong fortress had stood on the mountains for centuries.
- P. 23—"Peltasts," pel'tasts; "Pol'y-phron"; "Pol'y-do'rus."
- P. 24—"Larissa," la-ris'sa.
- P. 24—"Pharsalus," phar-sa'lus, now "Phersala." Chiefly celebrated for the battle fought there between Cæsar and Pompey in 48 B. C.
- P. 24—"Aleuadæ," a-leu'a-dæ; "Amyntas," a-myn'tas; "Krannon," cran'non; "Eurydike," eu-ryd'i-ce; "Perdikkas," per-dic'cas; "Pausanias," pau-sa'ni-as.
- P. 25—"Alorus," a-lo'rus; "Oneium," o-nei'um.
- P. 26—"Pammenes," pam'me-nes. A Theban general, and a friend of Epaminondas.
- P. 26—"Dyonysius," di'o-nys'i-us.
- P. 28—"Susa," su'sa. The Shushan of the Old Testament; the winter residence of the Persian kings.
- P. 28—"Rescript." The answer of the Roman emperor when consulted on any question was called the *rescript*.
- P. 29—"Drachmæ," dräch'mæ. A silver coin of the Greeks, worth about eighteen cents.
- P. 30—"Chersonese," cher'so-nese; "Chalkidike," chal-cid'i-ce;
- P. 30—"Byzantium," by-zan'ti-um. Now Constantinople.
- P. 31—"Kynos Kephale," cy'nos cep'h-a-læ.
- P. 31—"Magnesians." The inhabitants of Magnesia, the most easterly of the Thessaly. It contained the two mountains, Ossa and Pelion.
- P. 31—"Phthiotæ," phthi-o'tæ.
- P. 32—"Ænians," æ'ni-a'nes. An ancient race originally near Ossa, but afterwards in Southern Thessaly.
- P. 32—"Pallantium," pal-lan'ti-um; "A'se-a." Towns of Arcadia.
- P. 33—"Isidas," is'i-das.
- P. 34—"Kephisodorus," ce-phis'o-do'rus; "Gryllus," gryl'lus; "Euphranor," eu-phra'nor; "Mænalian," mæ-na'li-an.
- P. 35—"Tripolitza," tre-po-lit'sa.
- P. 36—"Diodorus," di'o-do'rus. A contemporary of Cæsar and Au-

gustus. He wrote "The Historical Library," consisting of forty books, not half of which are extant.

- P. 37—"Iolaidas," i-o-la'i-das.
- P. 38—"Status quo." The state in which.
- P. 39—"Tachos," ta'chos; "Nectanabis," nec-tan'a-bis.
- P. 39—"Kyrene," cy-re'ne. The chief city of Cyrenaica, in Northern Africa.
- P. 40—"Klerouchi," kle-rou'chi.
- P. 41—"Thebe," the'be; "Timoleon," ti-mo'le-on.
- P. 42—"Amphiktyonic," am-phic'ty-on'ic.
- P. 43—"Kirrhæan," cir-rhæ'an; "Delphi," del'phi.
- P. 43—"Magnetes," mag-ne'tes. The same as the Magnesians.
- P. 43—"Perrhæbians," per-rhæ'bi-ans; "Athamans," ath'a-ma'nes; "Dolopes," dol'o-pes.
- P. 44—"Philomelus," phil'o-me'lus; "Thracidæ," thra'ci-dæ; "Pythian," py-thi-an.
- P. 45—"Onomarchus," on'o-mar'chus.
- P. 46—"Illyrians," il-lyr'i-ans; "Pæonians," pæ-o'ni-ans; "Eupatridæ," eu-pat'ri-dæ; "Lykophron," lyc'o-phron. The brother-in-law of Alexander, and his assistant in his murder.
- P. 47—"Æschines," æs'chi-nes. The Athenian orator.
- P. 47—"Kleobule," cle-o-bu'le; "Gylon," gy'lon.
- P. 47—"Bosporus," bos'po-rus. Literally the *ox-ford*. The name given to any straits by the Greeks, but particularly to that uniting the Sea of Azof with the Black Sea. The country on both sides this latter was called Bosporus. Its cities became important commercial centers, and from them large supplies of corn were annually sent to Athens. It was in this country that Gylon made his money.
- P. 47—"Demochares," de-moch'a-res.
- P. 48—"Aphobus," aph'o-bus; "O-ne'tor."
- P. 48—"Palæstra," pa-læs'tra. In Greece a place for wrestling was called *palestra*.
- P. 48—"Plato." The philosopher. After having been instructed by the best teachers of his time Plato became a follower of Socrates. After the death of the latter he traveled in many countries, seeking knowledge, and at last returned to Athens to open a school in his garden, near the academy. Here Plato taught and wrote almost continuously until his death, about 348 B. C. His works have come down to us very complete and perfect. They are mainly in the form of dialogues, Socrates being one of the chief characters. His most important doctrines are the existence of the soul before entering the body, its independence of the body, and its immortality.
- P. 48—"Isokrates," i-soc'ra-tes. (436-338 B. C.) One of the ten Attic orators. He was carefully educated, but as he was too timid to come forward as an orator, he devoted himself to teaching the art and writing speeches for others. Although he took no part in public affairs he loved his country, and despairing of its freedom after the battle of Chæroneia, he took his own life. His style was artificial and labored, but exercised immense influence upon oratory at Athens.
- P. 49—"Isæus," i-sæ'us. One of the ten Attic orators. Instructed by Lysias and Isokrates. We have no particulars of his life. Eleven of his orations in existence are remarkable for their vigor and purity of style.
- P. 49—"Thucydides," thu-cyd'i-des. (471?-400?) The historian. Little more is known of his life than is related by Timayenis (vol. i., p. 337). The accounts of his death are uncertain. The work which gives him his place in history is his account of the Peloponnesian war.
- P. 49—"Lysias," lys'i-as. (B. C. 458-378.) An Attic orator. When a youth, Lysias emigrated to a colony in Italy, where he finished his education. After the defeat of the Athenians in Sicily he returned to Athens, but only to be imprisoned as an enemy of the government. He escaped, and on the overthrow of the tyranny of the thirty tyrants went back to Athens, where he wrote speeches. Only thirty-five are now extant, but they are said to be specimens of the best Attic Greek.
- P. 49—"Bema," be'ma. The Greek for the stage on which speakers stood.
- P. 50—"Phalerum," pha-le'rum. The most easterly of the harbors of Athens.
- P. 50—"Eunomus," eu'no-mus; "Perikles," per'i-cles; "Satyrus," sat'y-rus.
- P. 50—"Euripides," eu-rip'i-des. (B. C. 480-406.)

P. 50—"Sophocles," *soph'o-cles*. (B. C. 495?-406). The chief of the trio of Greek dramatists. In 468 he defeated Æschylus in a dramatic contest. His character is said to have been that of a complete Greek, combining symmetry of person, skill in music and gymnastics, self-possession, genius, taste. Only seven of his dramas have been preserved.

P. 51—"Dionysius of Halicarnassus." A rhetorician who came from Halicarnassus, a city in Asia Minor, about B. C. 29. His most ambitious work is a history of Rome in twenty-two books.

P. 52—"Herodotus," *he-rod'i-tus*.

P. 53—"Phokion," *pho'ci-on*.

P. 54—"Olynthians," *o-lyn'thi-ans*.

P. 55—"Perinthus," *pe-rin'thus*. An important town in Thrace on the Propontis.

P. 55—"Chares," *cha'res*.

P. 56—"Amphissa," *am-phis'sa*. Now Salona; though destroyed by Philip, it was afterward rebuilt.

P. 56—"Elateia," *el'a-te'a*. Its ruins still exist near the town of Elephtha.

P. 58—"Solon," *so'lon*; "The-og'nis"; "Alkæus," *al'ce-us*; "Pindar," *pin'dar*.

P. 59—"Æschylus," *Æs'chy-lus*. The great tragic poet. The Athenians called Æschylus the father of tragedy because of the changes he made in the representation of plays. He introduced a second actor, provided scenic effects, gave his actors better costumes, and introduced new figures into the choral dances. Only seven of his plays are in existence.

P. 59—"Iktinus," *ic-ti'nus*. A contemporary of Phidias and Pericles, and the architect of the Parthenon or temple of Minerva, on the Acropolis.

P. 59—"Polygnotus," *pol'yg-no'tus*.

P. 59—"Aristophanes," *ar'is-toph'a-nes*. The great comic poet of Athens, born about B. C. 444, but of whose private life almost nothing is known. His comedies are a series of caricatures on Athenians and their follies.

P. 61—"Skardus," *skar'dus*; "Ber'mi-us"; "Kam-bu'ni-an"; "Ægæ," *Æ'gæ*; "E-des'sa."

P. 62—"Thermaic," *ther-ma'ic*. See *Sinus Thermaicus* on map. "Pisistratidæ," *pis'is-trat'i-dæ*.

P. 62—"Strymon," *stry'mon*. The boundary between Thrace and Macedonia down to the time of Philip. "Archelaus," *ar'che-la'us*.

P. 63—"L'Etat, c'est moi." "The State, it is I."

P. 63—"Orestes," *o-res'tes*; "Aëropus," *a-er'o-pus*.

P. 65—"Nichomachus," *ni-chom'a-chus*.

P. 66—"Argæus," *ar-gæ'us*; "Amphipolis," *am-hip'o-lis*.

P. 67—"Mantias," *man'ti-as*; "Pangæus," *pan-gæ'us*.

P. 68—"Anthemus," *an'the-mus*.

P. 69—"Potidæa," *pot'i-dæ'a*; "Thasians," *tha'si-ans*.

P. 69—"Neoptolemus," *ne'op-tol'e-mus*; "Molossi," *mo-los'si*; "Æakidæ," *æ-ac'i-dæ*; "Samothrake," *sam'o-thra'ce*.

P. 70—"Sarissa," *sa-ris'sa*.

P. 71—"Phalangites," *fal'an-gi-tes*; "Hypaspists," *hy-pas'pists*; "Hetæri," *het'æ-ri*.

P. 72—"Paulus Æmilius," *pau'lus æ-mil'i-us*. (B. C. 230-160.) A Roman general.

P. 74—"Pagasæ," *pag'a-sæ*. Now Volo; also, the Pagasæan Gulf is now the Gulf of Volo.

P. 76—"Charidemus," *char-i-de'mus*.

P. 78—"Dionysia," *di-o-nys'i-a*. A festival in honor of the god Bacchus, celebrated in Athens in the spring, and with greater splendor than any other festival of the god.

P. 78—"Choregus." The Greek word for a leader of the chorus.

P. 78—"Apollodorus," *a'pol-lo-do'rus*.

P. 79—"Kritobulus," *crit-o-bu'lus*.

P. 81—"Phalækus," *pha-læ'cus*; "Tenedos," *ten'e-dos*.

P. 82—"Elaphebolion," *el'a-phe-bo'li-on*. The Greeks divided their year into twelve lunar months.

P. 84—"Prytaneium," *pryt-a-ne'um*. The common hall of the Senate, in which they met daily.

P. 86—"Parmenio," *par-me'ni-o*. Of whom Philip said "I have never been able to find but one general, and that is Parmenio."

P. 86—"Attalus," *at'ta-lus*.

P. 88—"Leonnatus," *le'on-na'tus*.

P. 89—"Ambrakiot," *am-bra'ci-ot*.

P. 90—"Eurymedon," *eu-rym'e-don*.

P. 91—"Leonidas," *le-on'i-das*. The hardy habits of self-denial which Alexander displayed were attributed by him to the teachings of the austere Leonidas.

P. 91—"Lysimachus," *ly-sim'a-chus*.

P. 93—"Hæmus," *hæ'mus*; "Triballi," *tri-bal'li*.

P. 94—"Onchestus," *on-ches'tus*; a town a little south of Lake Copias.

P. 94—"Lychnitis," or Lychnidus, *lych'ni-tis*; "Kleitus," *clei'tus*.

P. 94—"Glaukias," *glau'ki-as*. The king of one of the Illyrian tribes.

P. 95—"Phœnix," *phœ'nix*; "Proch'y-tes," "Ephialtes," *eph'i-al'tes*.

P. 95—"Sinope," *si-no'pe*. The most important of all the Greek colonies on the Black Sea in Asia Minor.

P. 95—"Diogenes," *di-og'e-nes*.

P. 96—"Artaxerxes," *ar'tax-er'xes*; "Mnemon," "O'chus," "Bagoas," *ba-go'as*; "Codomannus," *cod-o-man'nus*.

P. 97—"Abydos," *a'by-dos*. It was from Abydos to Sestus that Leander swam to Hero.

P. 98—"Philotas," *phi-lo'tas*; "Har'pa-lus," "Er'-i-gy'i-us" (*ji'yus*).

P. 99—"Zeleia," *ze-li'a*.

P. 99—"Arrian," *ar'ri-an*, (100-170 A. D.) A native of Bithynia. One of the best writers of his time. He strove to imitate Xenophon, attached himself to the philosopher Epictetus, as Xenophon to Socrates; wrote the lectures of Epictetus to correspond to the *Memorabilia*. His best work is a history of Alexander's Asiatic expedition, which, both in style and matter, is similar to the *Anabasis*. He wrote numerous other works, many of which are lost.

P. 100—"Justin." Lived in the third or fourth century. Justin left a history of the Macedonian empire, compiled from a work now lost by Trogus Pompeius, who lived in the time of Augustus.

P. 100—"Granicus," *gra-ni'cus*; "Skepsis," *scep'sis*; "Adrasteia," *ad'ras-ti'a*; "Pri-a'pus"; "Pa'ri-um"; "A-ris'be."

P. 101—"Meleager," *me'le-a'ger*; "Nikanor," *ni-ca'nor*.

P. 101—"Arrhibæus," *ar'ra-bæ'us*; "Ag'a-thon."

P. 101—"Baktrians," *bac'tri-ans*. The warlike inhabitants of Bactria, a northeast province of the Persian Empire.

P. 101—"Paphlagonians," *paph'la-go'ni-ans*. A district on the north of Asia Minor between Bithynia and Pontus.

P. 101—"Hyrcanians," *hyr-ka'ni-ans*. Hyrcania, the country of these people, is on the southern and southwestern shores of the Caspian Sea.

P. 101—"Arsites," *ar-si'tes*; "Spith'ra-da'tes"; "Ar-sam'e-nes."

P. 103—"Demaratus," *dem'a-ra'tus*; "Drop'i-des."

P. 104—"Lysippus," *ly-sip'pus*.

P. 104—"Sardis." One of the most famous cities of Asia Minor. This citadel had always been considered impregnable from its situation.

P. 105—"Miletus," *mi-le'tus*.

P. 106—"Tralles," *tral'les*; "Lycia," *lyc'i-a*; "Pam-phyli'a"; "Pi-sid'i-a"; "Gordium," *gor'di-um*; "San-ga'ri-us"; "Phrygia," *phryg'i-a*.

P. 108—"Mesopotamia," *mes'o-po-ta'mi-a*.

P. 108—"Sogdiana," *sog'di-a'na*. The northeastern portion of the Persian Empire, including portions of the present country of Turkistan and Bokhara.

P. 109—"Gates of Kilikia." See on map, p. 108, *Pyla Kilikia*. "Amanus," *a-ma'nus*.

P. 110—"Beylan," *ba'lan*.

P. 112—"Kardakes," *car'da-ces*.

P. 113—"Seleukis," *se-leu'cis*.

P. 116—"Kœle-Syria," *coel'e-syr'i-a*. Hollow Syria. The name given to the valley between the two ranges of Mount Lebanon, in the south of Syria, and bordering on Palestine.

P. 117—"Persepolis," *per-sep'o-lis*. A treasure city of the Persians situated on the north of the river Araxes.

P. 119—"Pelusium," *pe-lu'si-um*; "Hephæstion," *he-phæ'sti-on*.

P. 119—"Apis," *a'pis*. The name given to the Bull of Memphis, worshipped by the Egyptians as a god. There were certain signs by

which the animal was recognized to be the god: he must be black, a white, square mark must be on his forehead, etc. When found he was worshiped with greatest honors. Gradually the bull came to be regarded as a symbol, and Apis was identified with the sun.

P. 119—"Kanopus," *ka-no'pus*.

P. 119—"Pharos." The island is mentioned by Homer. Alexander united it to his new city by a mole. Ptolemy II. built a lighthouse here. Hence we have the name Pharos often given to such buildings. The translators of the Septuagint are said to have been confined here until they finished their task.

P. 119—"Mareotis," *ma-re-o'tis*.

P. 120—"Ammon." Originally an Ethiopian god, afterward adopted by the Egyptians. The Greeks called him Zeus Ammon, and the Romans, Jupiter Ammon. The god was represented under the form of a ram, and this seems to indicate that the original idea in the worship was that of a protector of flocks.

P. 121—"Arbela," *ar-be'la*; "Gaugamela," *gau-ga-me'la*.

P. 123—"Albanians." These people came from Albania, a country on the west of the Caspian and in the southeast of Georgia.

P. 123—"Karians," from Karia; "Menidas," *men'i-das*.

P. 124—"Bessus," *bes'sus*.

P. 125—"Aretas," *ar'e-tas*.

P. 127—"Curtius," *cur'ti-us*. The Roman historian of Alexander the Great. Nothing is known of his life. His history is fairly reliable.

P. 128—"Eulæus," *eu-læ'us*. The Old Testament Ulai, rises in Media, and uniting with the Pasitigris, flows into the Persian Gulf.

P. 128—"Pasitigris," *pa-sit'i-gris*.

P. 129—"Tænarus," *tæn'a-rus*. Now Cape Matapan.

P. 131—"Drangiana," *dran'gi-a'na*; "Ar'a-cho'si-a," "Ge-dro'si-a," "Par'o-pa-mis'i-dæ," "Seistan," *sā-stan'*; "Candahar," *can-da-har'*; "Zurrah," *zur'rah*.

P. 132—"Ecbatana," *ec-bat'a-na*.

P. 135—"Dioskuri," *di'os-cu'ri*. Literally the sons of Jupiter. The heroes Castor and Pollux.

P. 136—"Oxyartes," *ox'y-ar'tes*.

P. 137—"Telestes," *te-les'tes*; "Phi-lox'e-mus," "Bukephalia," *bu'ce pha-li'a*; "Akesines," *ac'e-si'nes*; "Hyd-ra-o'tes," "Hyph'a-sis."

P. 139—"Arabitzæ," *ar'a-bi'tæ*; "O-ri'tæ," "Ich'thy-oph'a-gi."

BRIEF HISTORY OF GREECE.

The "Brief History of Greece" has not been annotated as the pronunciation of the Greek and Latin names is marked, and its foot notes are sufficient.

AMERICAN LITERATURE.

P. 9—"Sandys," *sān'dis*.

P. 11—"Magnalia Christi Americana." The great deeds of Christ in America.

P. 14—"Fox." (1624-1690.) The founder of the sect of the Quakers.

P. 14—"Ipswich," *ips'wich*, "Ag-a-wam'." The latter was the first name given to Ipswich.

P. 15—"Yale Library." These forty books have increased to over 112,000, exclusive of pamphlets.

P. 18—"Hopkinsianism," *hop-kins'i-an-ism*.

P. 20—"Philomath," *phil'o-math*. A lover of learning.

P. 21—"Brainherd," *brā'nerd*.

P. 25—"Publius," *pūb'li-us*.

P. 27—"Freneau," *fre-nō'*.

P. 27—"Huguenot," *hū'ge-not*. Diminutive of Hugo, a heretic and conspirator. The name was afterwards given to the French Protestants of France.

P. 27—"Columbiad," *co-lūm'bi-ad*.

P. 28—"DeFoe," *de-fō'*. (1661?-1731.)

P. 30—"Hollis professorship." Established in 1721 by Thomas Hollis. Being a Baptist, he required that the candidate for the professorship should be of orthodox principles.

P. 31—"Trinitarian," *trin-i-ta'ri-an*. Pertaining to the Trinity.

P. 31—"Arian," *a'ri-an*. A follower of Arius, who held Christ to be a created being.

P. 36—"Schaff," *shāf*.

P. 36—"Swedenborgian," *swē-den-bōr'gi-an*.

P. 39—"Pseudonym," *sū'do-nīm*. A fictitious name.

P. 39—"Salmagundi," *sāl-ma-gūn'di*. Originally a mixture of chopped meats, fish with pepper, etc.; hence, a medley, a *pot-pourri*.

P. 42—"Granada," *gra-na'da*; "Al-ham'bra."

P. 45—"Guildford," *gil'ford*.

P. 46—"Marco Bozzaris," *mar'cō bot'sā-ris*. A Greek patriot, born in 1790, killed at Missolonghi in 1823.

P. 46—"Buccanneer," *būc'ca-neer'*.

P. 47—"Muhlenburg," *mu'len-berg*.

P. 47—"Hadaḍ," *hā'dād*.

P. 48—"Thanatopsis," *than-a-top'sis*. A view of death.

P. 49—"Phi Beta Kappa Society." A prominent Greek letter society, founded in the College of William and Mary in 1776.

P. 49—"Verplanck," *ver-plānk'*.

P. 51—"Lope de Vega," *lo'pā da vā'gā*. (1562-1635.) A Spanish poet and dramatist.

P. 52—"Bruges," *brūzh*.

P. 54—"Morturi Salutamus." Literally, We about to die, salute you.

P. 54—"Aftermath," *aft'er-māth*. The second crop of grass mown in a year.

P. 54—"Ostre-mer." Beyond the sea.

P. 54—"Hyperion," *hy-pe'ri-on*; "Kavanagh," *kav'a-nāh*.

P. 61—"Launfal," *laun'fal*.

P. 63—"Baudelaire," *bō-de-lar*.

P. 67—"Göttingen," *get'ting-en*.

P. 70—"Barneveld," *bar'ne-vēlt*.

P. 72—"Mohicans," *mo-hi'cans*.

P. 74—"Surinam," *soo-ri-nam'*. Dutch Guiana.

P. 76—"Thoreau," *thō-ro*.

P. 78—"Aurelian," *au-re'li-an*; "Ju'li-an," "Ze-no'bia."

P. 78—"Yemassee," *ye-mas-see'*. The Yemassee were the tribe of Indians afterwards called Savannahs.

P. 78—"Beauchampe," *bō'shōn'*.

P. 81—"Potiphar," *pot'i-phar*.

P. 84—"Audubon," *aw'du-bon*; "Agassiz," *āg'a-see*; "Guyot," *gē'o'*.

P. 87—"Pre-Raphaelites," *pre-rāph'a-el-ites*. Following the style before the time of Raphael.

P. 89—"Improvisatori," *im-prō'vi-sa-tō'ri*. Those who compose extemporaneously.

P. 92—"Rossetti," *ros-sēt'te*.

P. 94—"Toujours amour." Always love.

P. 94—"Piatt," *pī'at*.

P. 103—"Azarian," *az'a-ri'an*.

P. 103—"Hjalmar Hjorth Boyesen," *h-a-jal-mer h-a-jorth bo-yay-sen*.

P. 110—"Litterateur," *le-tā'rā-tur*. A literary man.

NOTES ON REQUIRED READINGS IN "THE CHAUTAUQUAN."

GERMAN HISTORY.

P. 1, c. 1—"Clovis," *klō'vis*; "Charlemagne," *shar'le-mān'*; "Rudolphus," *roo-dōl'fus*; "Swabian," *swā'bi-an*; "Hohenstaufen," *hō'en-stow'fen*; "Westphalia," *west-phā'lī-a*.

P. 1, c. 1—"Maas." The Flemish name for the Meuse.

P. 1, c. 1—"March," or "Morawa." A river of Austria. Its position as a boundary of Hungary, and proximity to Vienna, have often made it of historical importance.

P. 1, c. 1—"Mur," or "Muir," *moor*.

P. 1, c. 2—"Prona," *pro'sna*; "Nieman," *net'man*.

P. 1, c. 2—"Teutoburg," *toi'to-boorg*. A range of mountains in Western Germany, about eighty miles in length. It was in this forest that the German Arminius defeated the Romans in A. D. 9.

P. 1, c. 2—"Erz," *erts*. The Erzgebirge, or Ore Mountains, are on the boundary between Bohemia and Saxony, extending about 100 miles. There are several granite peaks in the range. These mountains have long been famous for their mineral products of silver, tin, iron, cobalt, copper, etc. Coal is found also and porcelain clay.

P. 1, c. 2—"Riesen," *ree'zen*. Giant mountains. A continuation of the Erzgebirge, lying east of the river Elbe. The range extends about seventy-five miles. It is of the same geological formation as the Erz.

P. 1, c. 2—"We'ser," *Vistula*, *vist'yu-la*.

P. 1, c. 2—"Magyar," *mod'jor*. A tribe which came from the far East. In 887 they came into Hungary and soon conquered it and the adjoining country. For one hundred years their conquests were extended, but at last they consolidated the power within their own country. The Magyars possessed an independent kingdom until the present century, but now constitute one of the two leading divisions of the Austro-Hungarian monarchy. The Emperor of Austria is the King of Hungary.

P. 1, c. 2—"Turanians," *tu-ra'ni-ans*. The tribes of the Turanians are the Finns, the people of Siberia, the Tartars, the Mongols, and the Mantchoos.

P. 1, c. 2—"Aryan," *ar'yan*. The tribes speaking the Germanic, Slavic, Celtic, Italic, Greek, Iranian, and Sanskrit languages belong to this family.

P. 1, c. 2—"Teutonic," *teu-ton'ic*. The Teutonic dialects were the languages spoken by the ancient Germans, so-called from one of the tribes, the Teutons.

P. 1, c. 2—"Pytheas," *pyth'e-as*. He is said to have made two voyages, one to Britain and Iceland, another to the northern coast of Europe.

P. 1, c. 2—"Tuisko," *too-is'ko*. The German legends describe the god as a gray-haired man, clad in skins of animals, and with a scepter in his right hand.

P. 2, c. 1—"Tacitus," *tac'i-tus*. (A. D. 55-117.) A Roman historian. His histories of the condition and customs of the Britains and Germans are trustworthy accounts, written in a clear and concise style. A history of Rome is his most ambitious work.

P. 2, c. 2—"Suetonius," *swe-to'ni-us*. A Roman historian, living in the latter half of the first century. His writings were very voluminous.

P. 2, c. 2—"Kelt," or "Celt." A race of Asiatic origin, which in very early time passed into Europe and gradually worked their way to the present countries of France, and Great Britain. The Irish, Welsh, and the Scotch of the Highlands are descendants of the Celts.

P. 2, c. 2—"Eagle." From the time of Marius the eagle was the principal emblem of the Roman Empire, and the standard of the legions. In the fourteenth century the Germans adopted it, and afterwards Russia. The arms of Prussia bear the black eagle, those of Poland bore the white.

P. 2, c. 2—"De Moribus Germanorum." Treatise concerning the customs of the Germans.

P. 2, c. 2—"Titus." (A. D. 40-81.) Roman Emperor. Titus had opportunities of observing the Germans when he was young, being military tribune in Germany.

P. 2, c. 2—"Wo'dan," The same as Odin, Wuotan, and Wotan. See "Notes on Scandinavian Literature," in THE CHAUTAUQUAN for April.

P. 2, c. 2—"Hertha," also written Ærtha, or Nerthus. As goddess of the earth Hertha was believed to bring fertility. In the spring festivities were held to celebrate her arrival, all feuds were suspended and the greatest rejoicing prevailed.

P. 2, c. 2—"Runes." The Norsemen had a peculiar alphabet of sixteen letters, or signs. It was not used as we use our alphabet; indeed, as the word *rune* (mystery) signifies, its meaning was known to but few. The letters were carved on rocks, stones, utensils, etc. Also, as in the case alluded to, on smooth sticks for divination. A mysterious power was supposed to reside in these characters.

The article on "Air," in the Physical Science series, is abridged from the "English Science Primer on Physical Geography," by Archibald Geikie. The clear, simple style of the article make annotations unnecessary. The same is also true of the paper on "Political Economy."

SUNDAY READINGS.

P. 6, c. 2—"Archæology," *ar-chæ-ol'o-gy*. The science of antiquities.

P. 7, c. 1—"Guadaloupe," *gaw'da-loop'*. An island of the West Indies.

P. 7, c. 2—"Owen," (1807-1860.) An American geologist. He made geological surveys of several States of the West and published reports of his labors.

P. 8, c. 1—"Lamartine," *lä-mar-ten'*. (1790-1869.) A French poet. After several years of writing and travel Lamartine, in 1835, was chosen a member of the Chamber of Deputies. Here his oratory won him laurels. He was a Liberalist, and in 1848, during the establishment of the republic, Lamartine's eloquence and boldness prevented open attack upon the aristocracy. He occupied several positions under the new government, but finally retired to literary work.

READINGS IN ART.

P. 11, c. 1—"Glyptics," *glyp'tics*. Carving on precious stones.

P. 11, c. 1—"Bas relief," *bä-re-leef'*. "Michael Angelo," *me-kël an'ja-lo*. (1474-1562). The Italian painter and sculptor.

P. 11, c. 2—"Lapidary," *läp'i-da-ry*. One who cuts, polishes, and engraves stones. "Vitreous," *vit're-ous*, glassy; "Ter'ra cot'ta;" "Chryselephantine," *chrys'el-e-phänt'ine*; "To-reu'tic;" "Ar'ma-ture."

P. 12, c. 1—"Galvano-plastique," *gal-vä'no-pläs-teek*; "Bäs'so-re-lie'vo;" "Stiacciato," *ste-ät-chä'to*; "Mezzo-relievo," *méd'zo-re-lie'vo*; "Al'to-re-lie-vo;" "Ca-vo-re-lie'vo."

P. 12, c. 1—"Renaissance," *rüh-nä'söngs'*. The awakening or new birth, that took place in architecture, literature, and the fine arts from the fourteenth to the sixteenth century. Men's minds during the middle ages had been under the influence of the church. Freedom of thought and action became almost extinct. Reaction revived all branches of art and literature, producing the period called the "Renaissance."

P. 12, c. 1—"Polycleitus," *pol'y-clei'tus*. A Greek sculptor who lived about 430 B. C. His statues of men are said to have surpassed those of Phidias. The Spear-bearer was a statue so perfectly proportioned that it was called the canon or rule.

P. 12, c. 2—"Vitruvius Pollio," *vi-tru'vi-us pol'i-o*. A Roman architect who served under Caesar. His treatise on architecture is a compendium of Greek writers on the subject.

P. 12, c. 2—"Mem'phis." Meaning the abode of the good one. Once the most magnificent city of Egypt, the capital of the kingdom, and residence of several Egyptian deities. It is only of late that its site has been known.

P. 12, c. 2—"Cheops," *ke'ops*.

P. 12, c. 2—"Renan," *ree'nan*. A French orientalist, author and critic.

P. 12, c. 2—"Mariette," *mä're'ët'*. French Egyptologist.

P. 12, c. 2—"Ghizeh," *jee'zeh*, or *gee'zeh*. A village of Egypt three miles from Cairo. The three great pyramids are but five miles from Ghizeh.

P. 12, c. 2—"Amosis," *a-mo'sis*; "A-mu'nothph;" "Thoth'mo-sis;" "Ni-to'cris."

P. 13, c. 1—"Karnak," *kar'nak*. A modern village of Egypt, in which has been found a portion of the ruins of Thebes.

P. 13, c. 1—"Mem'non." A statue of a hero of the Trojan war. It is called musical because at sunrise a sound comes from it like the twang of a harp string. It has been conjectured that this tone was caused by the expansive effect of the sun's rays upon the stone.

P. 13, c. 1—"Ram'ses;" "Tu'rin."

P. 13, c. 1—"Osiris," *o-si'ris*. One of the chief divinities of the Egyptians.

P. 13, c. 1—"Louvre," *loovr*; "Abou Simbel," *äboo-sim'bel*; "Coptic," *cöp'tic*.

P. 13, c. 2—"Edfou," *ed'foo'*; "Denderah," *den'der-äh*.

P. 13, c. 2—"Hadrian," *ha'dri-an*, or Adrian. (76-138.) Roman Emperor.

P. 13, c. 2—"Botta," *bot'tä*; "Mo'sul."

P. 14, c. 1—"Sarcophaguses," *sar-cöph'a-güses*. Literally the word means *eating flesh*, and was named from the peculiar kind of limestone used by the Greeks for making coffins which consumed the body in a short time. Now a coffin or tomb made from stone of any kind

P. 14, c. 1—"Cambyzes," kam-bi'séz. The second king of Persia, and probably the Ahasuerus mentioned in Ezra.

AMERICAN LITERATURE.

P. 14, c. 2—"Sandys." The extract here given is taken from the dedication of one of Sandys's works to Prince Charles, afterward King Charles I. The work bears the ambitious title, "A Relation of a Journey begun in A. D. 1610; Four Bookes containing a description of the Turlish Empire, of Egypt, of the Holy Land, of the remote parts of Italy and Islands adjoining." Of this work a traveler of the times says. "The descriptions are so faithful and perfect that they leave little to be added by after-comers, and nothing to be corrected."

P. 15, c. 2—"Mogul," mo-gul'. A person of the Mongolian race.

P. 15, c. 2—"Cateris paribus." Other things being equal.

P. 15, c. 2—"Boyle," boil. (1626-1691.) An Irish chemist and philosopher. He has been called the inventor of the air pump, and by it he demonstrated the elasticity of the air. His charity and philanthropy gave him the reverence of his associates and his philosophical experiments placed him among scientists. He has been called "the great Christian philosopher."

P. 15, c. 2—"Bodleian," bód'le-an. Pertaining to Sir Thomas Bodley, who founded a celebrated library in Oxford in the sixteenth century.

P. 15, c. 2—"Vat'i-can." An assemblage of buildings in Rome, including the Pope's palace, museum, library, etc.

P. 16, c. 1—"Edwards." This selection is taken from Edwards's treatise on the "Religious Affections."

CHAUTAUQUA CHILDREN'S CLASS, 1883.

The grades of the written examination are given upon the standard of 100. The three receiving 98 $\frac{3}{4}$ in the full-course list are entitled to the prizes. No prizes are given to those passing only on the lessons of the first series, but their standards are given showing good work.

FULL COURSE.

GERMAN HISTORY.

By Rev. W. G. WILLIAMS, A.M.

II.

From the time of Julius Cæsar to the fall of the Roman Empire, a period of more than four hundred years, the greater part of the Germans were subject to Roman rule, a rule maintained only by military force. But the struggle against Rome never entirely ceased—and as Roman power gradually declined the Germans seized every opportunity to recover their liberty and in their turn became conquerors. To trace the succession of their vicissitudes during this period would be to give the narrative of a bold, vigorous, war-like people in their rude barbaric condition. We should discover even in those early times those race characteristics of strength, bravery and persistence which became so marked in later centuries; we should recognize in Hermann, the first German leader, the prophecy of the Great Charles who steps upon the scene nearly eight centuries later.

HERMANN, THE FIRST LEADER.

He it was (Hermann Arminius) who, with a power to organize equal to that of William of Orange, bound the German tribes in a secret confederacy, whose object it was to resist and repel the Roman armies. While still himself serving as an officer in the Roman army, he managed to rally the confederated Germans and to attack Varus's army of forty thousand men—the best Roman legions—as they were marching through the Teutoburger Forest, where, aided by violent storms, the Germans threw the Romans into panic and the fight was changed to a slaughter. When the news of the great German victory reached Rome the aged Augustus trembled with fear; he let his hair and beard grow for months as a sign of trouble, and was often heard to exclaim: "O, Varus, Varus, give me back my legions." Though Rome, under the able leadership of Germanicus, soon after defeated the Germans, yet she had been taught that the Germans possessed a spirit and a power sufficient to make her tremble for her future supremacy.

Hermann seems to have devoted himself to the creation of

a permanent union of the tribes he had commanded. We may guess, but can not assert, that his object was to establish a national organization like that of Rome, and in doing this he must have come into conflict with laws and customs which were considered sacred by the people. But his remaining days were too few for even the beginning of a task which included such an advance in the civilization of the race. We only know that he was waylaid and assassinated by members of his own family in the year 21. He was then 37 years old and had been for thirteen years the leader of his people.*

He was undoubtedly the liberator of Germany, having dared to grapple with the Roman power, not in its beginnings, like other kings and commanders, but in the maturity of its strength. He was not always victorious in battle, but in war he was never subdued. He still lives in the songs of the barbarians, unknown to the annals of the Greeks, who only admire that which belongs to themselves—nor celebrated as he deserves by the Romans, who, in praising the olden times, neglect the events of the later years.†

GERMAN NATIONALITIES AT THE CLOSE OF THE THIRD CENTURY.

When we meet the Germans at the close of the third century we are surprised to find that the tribal names which they bore in the time of Hermann have nearly all disappeared, and new names of wider significance have taken their places. Instead of thirty to forty petty tribes, they are now consolidated into four chief nationalities with two or three inferior, but independent branches. Their geographical situation is no longer the same, migrations have taken place, large tracts of territory have changed hands, and many leading families have been overthrown and new ones arisen. Nothing but the constant clash of arms could have wrought such change. As each of these new nationalities plays a prominent part in the following centuries, a short description of them is given:

1. *The Alemanni*.—The name of this division (*Alle Mannen*, signifying "all men") shows that it was composed of fragments of many tribes. The Alemanni first made their appearance along the Main, and gradually pushed southward over the Tith lands, where the military veterans of Rome had settled, until they occupied the greater part of southwestern Germany, and eastern Switzerland to the Alps. Their descendants occupy the same territory to this day.

2. *The Franks*.—It is not known whence this name is derived, nor what is its meaning. The Franks are believed to have been formed out of the Sicambrians in Westphalia, a portion of the Chatti and the Batavi in Holland, together with other tribes. We first hear of them on the Lower Rhine, but they soon extended their territory over a great part of Belgium and Westphalia. Their chiefs were already called kings, and their authority was hereditary.

3. *The Saxons*.—This was one of the small original tribes settled in Holstein. The name "Saxon" is derived from their peculiar weapon, a short sword, called *saxs*. We find them

* Bayard Taylor.
† Tacitus.

occupying at the close of the third century nearly all the territory between the Harz Mountains and the North Sea, from the Elbe westward to the Rhine. There appears to have been a natural enmity—no doubt bequeathed from the earlier tribes out of which both grew—between them and the Franks.

4. *The Goths.*—Their traditions state that they were settled in Sweden before they were found by the Greek navigators on the southern shore of the Baltic in 330 B. C. It is probable that only a portion of the tribe navigated, and that the present Scandinavian race is descended from the remainder. They came in contact with the Romans beyond the mouth of the Danube about the beginning of the third century.*

INFLUENCE OF THE ROMANS ON THE GERMANS.

The proximity of the Romans on the Rhine, the Danube, and the Neckar, had by degrees effected alterations in the manners of the Germans. They had become acquainted with many new things, both good and bad. By means of the former they became acquainted with money, and even luxuries. The Romans had planted the vine on the Rhine, and constructed roads, cities, manufactories, theaters, fortresses, temples, and altars. Roman merchants brought their wares to Germany, and fetched thence amber, feathers, furs, slaves, and the very hair of the Germans; for it became the fashion to wear light flaxen wigs, instead of natural hair. Of the cities which the Romans built there are many yet remaining, as Salzburg, Ratisbonne, Augsburg, Basle, Strasburg, Baden, Spires, Worms, Metz, Treves, Cologne, Bonn, etc. But in the interior of Germany, neither the Romans nor their habits and manners had found friends, nor were cities built there according to the Roman style.†

INVASION OF THE HUNS—ATTILA.

The fourth century of our era and the first half of the fifth were characterized by the spirit of migration among all the peoples beyond the Rhine. Representatives of every German village and district went to Rome, and each brought back stories of the wealth and luxury that existed there. They had the keen perception and the strength to recognize the increasing weakness of the government, and also to despise the enervation and corruption of its citizens. The German was ambitious and restless as daily he regarded Rome more and more as his prey. The Romans themselves saw the danger of the Empire and lived in apprehension of overwhelming incursions long before they came. In the latter part of the fourth century the great impulse was given to the people of northern and eastern Europe by successive invasions from Asia; and a vast and general movement began among them which resulted in the disintegration of the Roman Empire, and the transfer of the principal arena of history from the shores of the Mediterranean Sea to the countries in which the great powers of modern Europe afterward grew up. The first impulse to this series of events was given by disturbances and migrations in central Asia, of whose cause hardly anything is known. Long before the Christian era there was a powerful race of Huns in north-eastern Asia who became so dangerous to the Chinese that the great wall of China was built as a defense against them (finished B. C. 244).‡

These Huns, a Mongol race, had migrated from the center of Asia westward three-quarters of a century previously (A. D. 375), carrying death and devastation on their path. They had nothing in common with the peoples of the West, either in facial features or habits of life. Contemporary historians describe them as surpassing by their savagery all that can be imagined. They were of low stature, with broad shoulders, thick-set limbs, flat noses, high cheek-bones, small eyes deeply sunk in the sockets, and yellow complexion. Ammianus Marcellinus com-

pares them, in their monstrous ugliness, to beasts walking on two legs, or the grinning heads clumsily carved on the posts of bridges. They had no beard, because from infancy their faces were hideously scarred by being slashed all over, in order to hinder its growth. Accustomed to lead a wandering life in their native country, these wild hordes traversed the Steppes, or boundless plains which lie between Russia and China, in huge chariots, or on small hardy horses, changing their stations as often as fresh pasture was required for their cattle. Except constrained by necessity, they never entered any kind of house, holding them in horror as so many tombs. They were accustomed from infancy to endure cold, hunger, and thirst. As the great boots they were deprived them of all facility in marching, they never fought on foot; but the skill with which they managed their horses and threw the javelin, made them more formidable to the Germans than even the disciplined, but less ferocious, legions of Rome.

This was the rude race which, bursting into Europe in the second half of the fourth century, shook the whole barbarian world to its center, and precipitated it upon the Roman Empire. The Goths fled before them, when they passed the Danube, the Vandals when they crossed the Rhine. After a halt of half a century in the center of Europe, the Huns put themselves again in motion.

Attila, the king of this people, constrained all the tribes wandering between the Rhine and the Oural to follow him. For some time he hesitated upon which of the two empires he should carry the wrath of heaven. Deciding upon the West, he passed the Rhine, the Moselle, and the Seine, and marched upon Orleans. The populations fled before him in indescribable terror, for the *Scourge of God*, as he was called, left not one stone upon another wheresoever he passed. Metz and twenty other cities had been destroyed. Troyes alone had been saved by its bishop, Saint Loup. He wished to seize upon Orleans, the key of the southern provinces; and his innumerable army surrounded the city. Its bishop, St. Aignan, sustained the courage of the inhabitants by promising them a powerful succor. Ætius, in fact, arrived with all the barbarian nations encamped in Gaul, at the expense of which the new invasion was made. Attila for the first time fell back; but in order to choose a battle-field favorable for his cavalry, he halted in the Catalaunian plains near Méry-sur-Seine. There the terrible shock of battle took place. In the first onset the Franks, who formed the vanguard of Ætius, fought with such animosity that 15,000 Huns strewed the plain. But next day, when the great masses on both sides encountered, the bodies of 165,000 combatants were left on that field of carnage. Attila was conquered. The allies, however, not daring to drive the wild Huns to despair, suffered Attila to retreat into Germany (451). In the year following he made amends for his defeat by an invasion of northern Italy, ravaging Aquileia, Milan, and other cities in a frightful manner, but died of an apoplectic stroke (453), soon after his return, and his empire fell with him, but not the terrible remembrance of his name and of his cruelties. The Visigoths, whose king had perished in the fight, and the Franks of Meroveus, had had, with Ætius, the chief honor of that memorable day in the Catalaunian plains. For it had become a question whether Europe should be German or Mongolian, whether the fierce Huns or the Germans should found an empire on the ruins of that which was then crumbling.*

FALL OF THE WESTERN EMPIRE—MANNERS AND MORALS OF THE GERMANS IN THIS AGE.

The Western Empire had now but a short time to live. The dastardly emperor Valentinian III., suspicious of the independent position of Ætius, recalled the conqueror of Attila from Gaul, and slew him with his own hand (A. D. 454). He was himself murdered soon after, and his widow, Eudoxia, though forced to

marry the assassin, determined to avenge her husband. She invited the Vandals, for this purpose, from Africa across the sea to Rome. This German tribe, still ruled by the aged Genserich, was the only one which possessed a fleet; and by this means the Vandals had already made themselves masters of the great islands of the Mediterranean, of Sicily, Sardinia, and Corsica. The "sea-king" eagerly obeyed the summons (A. D. 455), and now "golden Rome" was given up for fourteen days to his soldiers, and was sacked with such horrors that the name of Vandal has ever since been a proverb for barbarity and destruction. Yet the mediation of Leo the Great, then Bishop of Rome, saved the city from utter ruin. From this time onward the emperors, who followed one another in quick succession, were mere tools of the German generals, and symbols of power before the common people; for the whole imperial army now consisted of the remnants of various German nations, who had sought service for pay. These too, at last, like their kindred in the provinces, demanded lands in Italy, and would have no less than one-third of the soil. When this was refused, Odoacer, at the head of his soldiers—Heruli, Sciri, Turcilingi, and Rugii, who forced their way thither from the Danube—put an end to the very name of the Roman Empire, stripping the boy Romulus Augustulus, the last emperor, of the purple, and ruling alone in Italy, as German general and king. Thus the Western Empire fell by German hands, after they had already wrested from it all its provinces, Africa, Spain, Gaul and Britain. This occurred in the year 476. Ancient history ends with this event; but in the history of the Germans it is merely an episode.

At the time of the great migrations, the German tribes were barbarians, in that they were destitute alike of humanity toward enemies and inferiors, and of scientific culture. Neither the pursuit of learning nor the practice of mercy to the vanquished could seem to them other than unmanly weakness. Their ferocity spread misery and ruin through the whole arena of history, and made the fifth and sixth centuries of our era the crowning epoch in the annals of human suffering; while their active, passionate contempt for learning destroyed the existing monuments of intelligence and habits of inquiry and thought, almost as completely as they swept away the wealth, prosperity, and social organization of the Roman world. Their ablest kings despised clerical accomplishments. Even Theodoric the Great could not write, and his signature was made by a black smear over a form or mould in which his name was cut. Nevertheless these nations were not what we mean by savages. Their originally beautiful and resonant language was already cultivated in poetical forms, in heroic songs. There was intercourse and trade among the several nations. Minstrels, especially, passed from one royal court to another, and the same song which was sung to Theodoric in Ravenna could be heard and understood by the Vandals in Carthage, by Clovis in Paris, and by the Thuringians in their fastnesses. A common language was a strong bond of union among these nations. Messengers, embassies, and letters were sent to and fro between their courts; gifts were exchanged, and marriages and alliances entered into. Thus the nations were informed concerning one another, and recognized their mutual relationship. It was this international intercourse that gave rise to the heroic minstrelsy—a faithful relation of the great deeds of German heroes during the migrations; but the minstrel boldly transforms the order of events, and brings together things which in reality took place at intervals of whole generations. Thus they sing of Hermanric, of Theodoric the Great (Dietrich the Strong, of Berne), and of his faithful knight Hildebrand; then of the fall of the Burgundian kings, of the far-ruling Attila, and of Sigurd, or Siegfried, who was originally a Northern god of spring, but here appears as a youthful hero, faithful and child-like, simple and unsuspicious, yet the mightiest of all—the complete image of the German character.

These wild times of warfare and wandering could not, of course, favorably affect morals and character. They did much to root out of the minds and lives of the people their ancient

heathen faith and practices. Their old gods were associated with places, scenes, features of the country and the climate; and, with these out of sight, the gods themselves were easily forgotten. Moreover, the local deities of other places and nations were brought into notice. The people's religious habits were broken up, their minds confused, and thus they were better prepared than before to embrace the new and universal doctrines of Christianity. But the wanderings had a bad effect on morality in all forms. The upright German was still distinguished by his self-respect from the false, faithless, and cowardly "Welshman," whose nature had become deformed through years of servitude. But Germans, too, were now often guilty of faithlessness and cruelty; and some tribes grew effeminate and corrupt, especially the Vandals in luxurious Africa. They imitated the style of the conquered in dress, arms, and manner of life; and some adopted their language also. For instance, even Theodoric the Great corresponded in Latin with foreign monarchs; and as early as the sixth and seventh centuries, the Germans recorded their own laws in Latin, the West Goths and Burgundians introducing the practice, which was followed by the Franks, Alemanni, Bavarians, and Langobards. These laws, and the prohibitions they contain, are the best sources of information upon the manners of the time, and especially upon the condition of the lower orders, the peasants, and the slaves. The most frequent cases provided are of bodily injuries, murder, wounds, and mutilations, showing that the warlike disposition had degenerated into cruelty and coarseness. For all these injuries, the wergeld, or ransom, was still a satisfaction. The life of a nobleman, that of a freeman, of a slave, and the members of the body—the eye, ear, nose, and hand—were assessed each at a fixed money valuation, to be paid by the aggressor, if he would not expose himself to the vengeance of the wronged man or his family. But crimes committed by peasants and slaves were punished by death, sometimes at the stake, where freemen might escape by paying a fine. The oaths of parties and witnesses were heard; and they were sustained by the oaths of others, their friends, relations, or partisans, who swore that they were to be believed. If an accused party swore that he was innocent, it was only necessary for him to obtain a sufficient number of compurgators, or jurors, of his own rank to swear that they believed him, in order to secure acquittal. But the number required was much larger for men of low rank than for the nobles; and the freedmen and slaves had no rights of the kind, but were tortured at will to compel them to confess or testify. The slaves were often tried by an ordeal, and were held guilty of any accusation if they could not put their hands into boiling water without harm. For freemen, if no other evidence were accessible, a trial by battle was adopted, as an appeal to God's judgment. The heathen tribes in Germany proper—the Frisi, Saxons, Thuringians, and Alemanni—lived on in their old ways; yet they too failed to maintain the spotless character assigned them by Tacitus. It was a time of general ferment. The new elements of civilization had brought with them new vices, and the simplicity of earlier days could not survive.*

[To be continued.]

* Lewis.

RIGHT well I know that improvement is a duty, and as we see man strives ever after a higher point, at least he seeks some novelty. But beware! for with these feelings Nature has given us also a desire to continue in the old ways, and to take pleasure in that to which we have been accustomed. Every condition of man is good which is natural and in accordance with reason. Man's desires are boundless, but his wants are few. For his days are short, and his fate bounded by a narrow span. I find no fault with the man who, ever active and restless, crosses every sea and braves the rude extremes of every clime, daring and diligent in pursuit of gain, rejoicing his heart and house by wealth.—Goethe.

GERMAN LITERATURE.

Among the Germans, as among all other nations, the earliest literature is poetical. Little is preserved of their ancient poetry, but Tacitus tells us that the Germans of his time had ancient songs relating to Tuisco and Mannus, and to the hero Arminius. It is the opinion of many critics that the stories of "Reynard, the Fox," and "Isengrim, the Wolf," may be traced back to these remote times. The legends of the "Nibelungenlied" have many marks of antiquity which would place them in this pre-historic age. The first definite period, however, is:

I. THE EARLY MIDDLE AGE.—When the German tribes accepted Christianity, the clergy strove to replace the native poetry by the stories of the gospel. In the fourth century Bishop Ulphilas prepared a clear, faithful and simple translation of the Scriptures, which has since been of value in the study of the Teutonic languages. Charles the Great overpowered the effort the priests had made to check poetry by issuing orders to collect the old German ballads. But few of these treasures of Old High and Low German literature have come down to us. Later the Church still further counteracted the influences of pagan literature by a religious poetry in which the life of Christ was sung in verse. Scholastic learning was also zealously cultivated in the monasteries and schools.

II. THE AGE OF CHIVALRY.—Under the Hohenstaufen dynasty during the period of Middle High German the country passed through one of the greatest epochs of its literature. The most characteristic outcome of this active era is a series of poetical romances produced in the twelfth and thirteenth centuries. In these romances the subject of whatever epoch it might be, was treated wholly in the spirit of chivalry, the supreme aim was to furnish an idealized picture of the virtues of knighthood. Wolfram von Eschenbach was one of the most brilliant of these writers; "Parzival," his chief poem, is purely imaginative. The hero is made to pass from a life of dreams to one of adventure, finally to become lord of the palace of the Holy Grail. Its object is to show the restless spirit of the Middle Ages, which, continually discontent with life, sought a nobler place.

Gottfried, of Strasburg, was a complete contrast to Wolfram and his greatest contemporary. Tristram and Isolde is his theme. Mediæval romance bore its richest fruit in these two poets, and most of their successors imitated either one or the other. To this age belongs the famous epic, the "Nibelungenlied," in which many ancient ballads have been collected and arranged. "Gudrun" is another epic in which a poet of this period has given form to several old legends. But lyrics as well as romances and epics mark the age of chivalry. The poets of this class were known as *minnesänger* because their favorite theme was *minne* or love. Of all the *minnesänger* the first place belongs to Walther von der Vogelweide. He wrote poems of patriotism as well as on the usual subjects of lyric verse.

To this epoch belong the beginnings of prose in German literature. Latin was the speech of scholars, and prose works were almost uniformly in that language. The "Sachsenspiegel" and "Schwabenspiegel," two collections of local laws, aroused interest among Germans in their language. The preachers, however, were the chief founders of prose style. Dissatisfied with the abuses and mere forms under which genuine spiritual life was crushed, they strove to awaken new and truer ideas of religion. A Franciscan monk, Berthold, and Eckhart are the two to whom most is due.

III. THE LATER MIDDLE AGE.—After the fall of the Hohenstaufen dynasty, chivalry died out in Germany, and with it the incentive to poetry. During the fourteenth and fifteenth centuries, attempts were made to produce poetry by rule. As every trade has its guild, so there was formed a guild of poetry, in which the members made their verses by the "tabulatur," and were obliged to pass through successive stages up to the "*meistersänger*." More important were the efforts at dramatic com-

position. They were crude representations of scriptural subjects, with which the clergy sought to replace the pagan festivals. Out of these representations grew the "mysteries," or "miracle plays," in which there was an endeavor to dramatize sacred subjects. "Shrove Tuesday plays" were dialogues, setting forth some scene of noisy fun, and were the first attempts at comedy.

During the latter part of the fifteenth century there was in Germany, as in other European countries, a great revival of intellectual life. It was due to two things—the re-discovery of Greek literature and the invention of printing. In the universities a broader culture took the place of scholastic studies. Many books found their way to the people, but these were mainly on social questions. The tyranny of princes and abuses of the clergy were the topics for the times, and multitudes of books were written ridiculing princes, priests, nobles, and even the Pope. The greatest of these satires was "Reineke Vos," by Barkhusen, a printer of Rostock. During this stirring period Maximilian I. was emperor, and attempted to revive the mediæval romance. His success was not great, and in no sense affected popular taste.

IV. THE CENTURY OF THE REFORMATION.—While the Renaissance brought about a great literary movement in England and France, and an artistic movement in Italy, in Germany the Reformation agitated the nation. Luther was the commanding spirit of the age in literature, as in religion. His greatest achievement was his translation of the Bible. For the first time a literary language was given to the nation. Luther gave to the men of all the countries of Germany a common speech, so that it is to him that the Germans owe the most essential of all the conditions of a national life and literature. Next to Luther stands Ulrich Von Hutten, an accomplished defender of the new culture and of the Reformation. Hans Sachs, the *meistersänger* of Muremburg, is now acknowledged to be the chief German poet of the sixteenth century. He wrote more than six thousand poems. His hymn, "Warum betrübst du dich, mein Herz," was soon translated into eight languages. The religious lyrics of this age were of superior worth. Indeed, next to the translation of the Bible, nothing did so much to unite the Protestants. During this century the drama made considerable progress.

V. THE PERIOD OF DECAY.—This period is in many respects the most dismal in German history. During the seventeenth century little poetry of worth was produced. No progress was made in the formation of the drama, and few prose works were written that are now tolerated. The one brilliant thinker of the age was Leibnitz.

VI. THE PERIOD OF REVIVAL.—With the accession of Frederick the Great, a stronger national life sprung up in Germany, and literature shared the growth. Several causes contributed to the advance of literature; the revival of classical learning, and a knowledge of English literature were chief. Several literary schools grew up. Important as were many of the writers in them, they exercised slight influence on the national mind compared with founders of the German classical literature—Klopstock, Wieland, and Lessing. Klopstock's fame mainly rests on the "Messiah," a work now little read, and if defective, yet full of striking and beautiful images. Klopstock's odes are superior to his dramas, the latter showing knowledge neither of the stage nor of life. His influence upon intellectual life in Germany was very marked.

Wieland was one of the most prolific of writers. "Oberon" is the most pleasing of his poems to modern readers, and by far most famous. "Agathon" is his best prose romance. Although at first a strong pietist, Wieland eventually became a pronounced epicurean. Lessing, the third of these great poets, is the only writer before Goethe that Germans now read sympathetically. As an imaginative writer he was chiefly distinguished in the drama, and his most important dramatic work is "Minna Von Barnhelm." Superior to his imaginative works were his labors as a

thinker. His style ranks with the greatest European writers, and his criticisms are of great value.

VII. THE CLASSICAL PERIOD.—About 1770 there began in German literary life a curious movement called "*Sturm und Drang*" (storm and pressure). Almost all young writers were under its influence. Its most prominent quality was discontent with the existing world. The critical guide of the movement was Herder. To him is due the impulse which led to a collection of the songs and ballads of the people. His most important prose work was "Ideas Toward the Philosophy of the History of Humanity." To Herder belongs the honor of stimulating the genius of Goethe, who holds in German literature the place of Shakspeare in English. His extraordinary range of activity is his most wonderful characteristic. Goethe's first published work placed him among the writers of the "*Sturm und Drang*" school, as was true of the earlier works of Schiller. The lyrics of Goethe have perhaps the most subtle charm of all his writings, but "*Hermann und Dorothea*," "*Wilhelm Meister*," "*Faust*," etc., are his great productions. Schiller, Goethe's great rival, divided with him the public attention and interest. Schiller's literary career began when he was only twenty-two. "*The Robbers*" and "*Don Carlos*" are his principal early works. It was in 1794 that Goethe and Schiller began that acquaintance which ripened into one of the most beautiful friendships in the history of literature. They wrote in common on Schiller's journal "*Die Horen*," and many of Schiller's works were influenced by the larger life of his friend. This is particularly true of his dramas, "*Wallenstein*," "*Die Jungfrau von Orleans*," "*Maria Stuart*," and "*Wilhelm Tell*."

In 1781 one of the most important works of German literature was published—Kant's "*Kritik der Reinen Vernunft*." The philosophical systems of Fichte, Schelling and Hegel followed, and excited even greater interest than the writings of the imaginative writers.

Each of the leading writers of the classical period had numerous followers, but the most important band was that which at first grew up around Goethe—the romantic school. The aim of the school was to revive mediævalism—to link daily life to poetry. The writer known as the prophet of the school was Frederick von Hardenburg, generally called Novalis. The critical leaders were Wilhelm and Friedrich von Schlegel. Tieck, Nackenroder, Fouqué, and Schleiermacher were the chief writers.

VIII. THE LATEST PERIOD.—In 1832, with the death of Goethe, a new era began in German literature. In philosophy the school of Hegel, who wrote during the lifetime of Goethe, has had many enthusiastic adherents; among these were Strauss, Ruge and Feuerbach. Schopenhauer, although he wrote his chief book during the time of Goethe at present stirs deeper interest than any other thinker.

In imaginative literature the greatest writer of the latest period is Heinrich Heine, whose lyrics have attracted general attention. The novel has acquired the same important place in Germany as in England. Among the chief novelists are Freytag, the Countess Ida Hahn-Hahn, Paul Heyse, Spielhagen and Reuter.

EVERYTHING that regards statesmanship and the interest of the world is in all outward respects of the greatest importance; it creates and destroys in a moment the happiness, even the very existence, of thousands, but when the wave of the moment has rushed past, and the storm has abated, its influence is lost, and even frequently disappears without leaving a trace behind. Many other things that are noiselessly influencing the thoughts and feelings often make far deeper and more lasting impressions on us. Man can for the most part keep himself very independent of all that does not trench on his private life—a very wise arrangement of Providence, since it gives a much greater security to human happiness.—*William von Humboldt*.

PHYSICAL SCIENCE.

II.—THE CIRCULATION OF WATER ON THE LAND.

Although air is continually evaporating water from the surface of the earth, and continually restoring it again by condensation, yet, on the whole and in the course of years, there seems to be no sensible gain or loss of water in our seas, lakes, and rivers; so that the two processes of evaporation and condensation balance each other.

It is evident, however, that the moisture precipitated at any moment from the air is not at once evaporated again. The disappearance of the water is due in part to evaporation, but only in part. A great deal of it goes out of sight in other ways.

The rain which falls upon the sea is the largest part of the whole rainfall of the globe, because the surface of the sea is about three times greater than that of the land. All this rain gradually mingles with the salt water, and can then be no longer recognized. It thus helps to make up for the loss which the sea is always suffering by evaporation. For the sea is the great evaporating surface whence most of the vapor of the atmosphere is derived.

On the other hand, the total amount of rain which falls upon the land of the globe must be enormous. It has been estimated, for example, that about sixty-eight cubic miles of water annually descend as rain even upon the surface of the British Isles, and there are many much more rainy regions. If you inquire about this rain which falls upon the land, you will find that it does not at once disappear, but begins another kind of circulation. Watch what happens during a shower of rain. If the shower is heavy, you will notice little runs of muddy water coursing down the streets or roads, or flowing out of the ridges of the fields. Follow one of the runs. It leads into some drain or brook, that into some larger stream, the stream into a river; and the river, if you follow it far enough, will bring you to the sea. Now think of all the brooks and rivers of the world, where this kind of transport of water is going on, and you will at once see how vast must be the part of the rain which flows off the land into the ocean.

But does the whole of the rain flow off at once into the sea in this way? A good deal of the rain which falls upon the land must sink underground and gather there. You may think that surely the water which disappears in that way must be finally withdrawn from the general circulation which we have been tracing. When it sinks below the surface, how can it ever get up to the surface again?

Yet, if you consider for a little, you will be convinced that whatever becomes of it underneath, it can not be lost. If all the rain which sinks into the ground be forever removed from the surface circulation, you will at once see that the quantity of water upon the earth's surface must be constantly and visibly diminishing. But no such changes, so far as can be seen, are really taking place. In spite of the rain which disappears into the ground, the circulation of water between the air, the land, and the sea continues without perceptible diminution.

You are driven to conclude, therefore, that there must be some means whereby the water underground is brought back to the surface. This is done by springs, which gush out of the earth, and bring up water to feed the brooks and rivers, whereby it is borne into the sea. Here, then, are two distinct courses which the rainfall takes—one below ground, and one above. It will be most convenient to follow the underground portion first.

A little attention to the soils and rocks which form the surface of a country is enough to show that they differ greatly from each other in hardness, and in texture or grain. Some are quite loose and porous, others are tough and close-grained. They consequently differ much in the quantity of water they allow to pass through them. A bed of sand, for example, is pervious; that is, will let water sink through it freely, because the little grains of sand lie loosely together, touching each other only at

some points, so as to leave empty spaces between. The water readily finds its way among these empty spaces. In fact, the sand-bed may become a kind of sponge, quite saturated with the water which has filtered down from the surface. A bed of clay, on the other hand, is impervious; it is made up of very small particles fitting closely to each other, and therefore offering resistance to the passage of water. Wherever such a bed occurs, it hinders the free passage of the water, which, unable to sink through it from above on the way down, or from below on the way up to the surface again, is kept in by the clay, and forced to find another line of escape.

Sandy soils are dry because the rain at once sinks through them; clay soils are wet because they retain the water, and prevent it from freely descending into the earth.

Now the rocks beneath us, besides being in many cases porous in their texture, such as sandstone, are all more or less traversed with cracks—sometimes mere lines, like those of a cracked window-pane, but sometimes wide and open clefts and tunnels. These numerous channels serve as passages for the underground water. Hence, although a rock may be so hard and close-grained that water does not soak through it at all, yet if that rock is plentifully supplied with these cracks, it may allow a large quantity of water to pass through. Limestone, for example, is a very hard rock, through the grains of which water can make but little way; yet it is so full of cracks or "joints," as they are called, and these joints are often so wide, that they give passage to a great deal of water.

In hilly districts, where the surface of the ground has not been brought under the plow, you will notice that many places are marshy and wet, even when the weather has long been dry. The soil everywhere around has perhaps been baked quite hard by the sun; but these places remain still wet, in spite of the heat. Whence do they get their water? Plainly not directly from the air? for in that case the rest of the ground would also be damp. They get it not from above, but from below. It is oozing out of the ground; and it is this constant outcome of water from below which keeps the ground wet and marshy. In other places you will observe that the water does not merely soak through the ground, but gives rise to a little run of clear water. If you follow such a run up to its source, you will see that it comes gushing out of the ground as a spring.

Springs are the natural outlets for the underground water. But, you ask, why should this water have any outlets, and what makes it rise to the surface?

Let us suppose that a flat layer of some impervious rock, like clay, underlies another layer of a porous material, like sand. The rain which falls on the surface of the ground, and sinks through the upper bed, will be arrested by the lower one, and made either to gather there, or find its escape along the surface of that lower bed. If a hollow or valley should have its bottom below the level of the line along which the water flows, springs will gush out along the sides of the valley. The line of escape may be either the junction between two different kinds of rock, or some of the numerous joints already referred to. Whatever it be, the water can not help flowing onward and downward, as long as there is any passage along which it can find its way; and the rocks underneath are so full of cracks, that it has no difficulty in doing so.

But it must happen that a great deal of the underground water descends far below the level of the valleys, and even below the level of the sea. And yet, though it should descend for several miles, it comes at last to the surface again. To realize clearly how this takes place, let us follow a particular drop of water from the time when it sinks into the earth as rain, to the time when, after a long journey up and down in the bowels of the earth, it once more reaches the surface. It soaks through the soil together with other drops, and joins some feeble trickle, or some more ample flow of water, which works its way through crevices and tunnels of the rocks. It sinks in this way to perhaps a depth of several thousand feet, until it reaches some

rock through which it can not readily make further way. Unable to work its way downward, the pent-up water must try to find escape in some other direction. By the pressure from above it is driven through other cracks and passages, winding up and down until at last it comes to the surface again. It breaks out there as a gushing spring.

Rain is water nearly in a state of purity. After journeying up and down underground it comes out again in springs, always more or less mingled with other materials, which it gets from the rocks through which it travels. They are not visible to the eye, for they are held in what is called chemical solution. When you put a few grains of salt or sugar upon a plate, and pour water over them, they are dissolved in the water and disappear. They enter into union with the water. You can not see them, but you can still recognize their presence by the taste which they give to the water which holds them in solution. So water, sinking from the soil downward, dissolves a little of the substance of the subterranean rocks, and carries this dissolved material up to the surface of the ground. One of the important ingredients in the air is carbonic acid gas, and this substance is both abstracted from and supplied to the air by plants and animals. In descending through the atmosphere rain absorbs a little air. As ingredients of the air, a little carbonic acid gas, particles of dust and soot, noxious vapors, minute organisms, and other substances floating in the air, are caught up by the descending rain, which in this way washes the air, and tends to keep it much more wholesome than it would otherwise be.

But rain not merely picks up impurities from the air, it gets a large addition when it reaches the soil.

Armed with the carbonic acid which it gets from the air, and with the larger quantity which it abstracts from the soil, rainwater is prepared to attack rocks, and to eat into them in a way which pure water could not do.

Water containing carbonic acid has a remarkable effect on many rocks, even on some of the very hardest. It dissolves more or less of their substance, and removes it. When it falls, for instance, on chalk or limestone, it almost entirely dissolves and carries away the rock in solution, though still remaining clear and limpid. In countries where chalk or limestone is an abundant rock, this action of water is sometimes singularly shown in the way in which the surface of the ground is worn into hollows. In such districts, too, the springs are always hard; that is, they contain much mineral matter in solution, whereas rainwater and springs which contain little impurity are termed soft.

When a stone building has stood for a few hundred years, the smoothly-dressed face which its walls received from the mason is usually gone. Again, in the burying-ground surrounding a venerable church you see the tombstones more and more mouldered the older they are. This crumbling away of hard stone with the lapse of time is a common familiar fact to you. But have you ever wondered why it should be so? What makes the stone decay, and what purpose is served by the process?

If it seem strange to you to be told that the surface of the earth is crumbling away, you should take every opportunity of verifying the statement. Examine your own district. You will find proofs that, in spite of their apparent steadfastness, even the hardest stones are really crumbling down. In short, wherever rocks are exposed to the air they are liable to decay. Now let us see how this change is brought about.

First of all we must return for a moment to the action of carbonic acid, which has been already described. You remember that rainwater abstracts a little carbonic acid from the air, and that, when it sinks under the earth, it is enabled by means of the acid to eat away some parts of the rocks beneath. The same action takes place with the rain, which rests upon or flows over the surface of the ground. The rainwater dissolves out little by little such portions of the rocks as it can remove. In the case of some rocks, such as limestone, the whole, or almost the whole, of the substance of the rock is carried away in solution. In

other kinds, the portion dissolved is the cementing material whereby the mass of the rock was bound together; so that when it is taken away, the rock crumbles into mere earth or sand, which is readily washed away by the rain. Hence one of the causes of the mouldering of stone is the action of the carbonic acid taken up by the rain.

In the second place, the oxygen of the portion of air contained in rainwater helps to decompose rocks. When a piece of iron has been exposed for a time to the weather, in a damp climate, it rusts. This rust is a compound substance, formed by the union of oxygen with iron. What happens to an iron railing or a steel knife, happens also, though not so quickly nor so strongly, to many rocks. They, too, rust by absorbing oxygen. A crust of corroded rock forms on their surface, and, when it is knocked off by the rain, a fresh layer of rock is reached by the ever-present and active oxygen.

In the third place, the surface of many parts of the world is made to crumble down by means of frost. Sometimes during winter, when the cold gets very keen, pipes full of water burst, and jugs filled with water crack from top to bottom. The reason of this lies in the fact that water expands in freezing. Ice requires more space than the water would if it remained fluid. When ice forms within a confined space, it exerts a great pressure on the sides of the vessel, or cavity, which contains it. If these sides are not strong enough to bear the strain to which they are put, they must yield, and therefore they crack.

You have learned how easily rain finds its way through soil. Even the hardest rocks are more or less porous, and take in some water. Hence, when winter comes the ground is full of moisture; not in the soil merely, but in the rocks. And so, as frost sets in, this pervading moisture freezes. Now, precisely the same kind of action takes place with each particle of water, as in the case of the water in the burst water-pipe or the cracked jar. It does not matter whether the water is collected into some hole or crevice, or is diffused between the grains of the rocks and the soil. When it freezes it expands, and in so doing tries to push asunder the walls between which it is confined.

Water freezes not only between the component grains, but in the numerous crevices or joints, as they are called, by which rocks are traversed. You have, perhaps, noticed that on the face of a cliff, or in a quarry, the rock is cut through by lines running more or less in an upright direction, and that by means of these lines the rock is split up by nature, and can be divided by the quarrymen into large four-sided blocks or pillars. These lines, or joints, have been already referred to as passages for water in descending from the surface. You can understand that only a very little water may be admitted at a time into a joint. But by degrees the joint widens a little, and allows more water to enter. Every time the water freezes it tries hard to push asunder the two sides of the joint. After many winters, it is at last able to separate them a little; then more water enters, and more force is exerted in freezing, until at last the block of rock traversed by the joint is completely split up. When this takes place along the face of a cliff, one of the loosened parts may fall and actually roll down to the bottom of the precipice.

In addition to carbonic acid, oxygen, and frost, there are still other influences at work by which the surface of the earth is made to crumble. For example, when, during the day, rocks are highly heated by strong sunshine, and then during night are rapidly cooled by radiation, the alternate expansion and contraction caused by the extremes of temperature loosen the particles of the stone, causing them to crumble away, or even making successive crusts of the stone fall off.

Again, rocks which are at one time well soaked with rain, and at another time are liable to be dried by the sun's rays and by wind, are apt to crumble away. If then it be true, as it is, that a general wasting of the surface of the land goes on, you may naturally ask why this should be. Out of the crumbled stones all soil is made, and on the formation and renewal of the soil we depend for our daily food.

Take up a handful of soil from any field or garden, and look at it attentively. What is it made of? You see little pieces of crumbling stone, particles of sand and clay, perhaps a few vegetable fibers; and the whole soil has a dark color from the decayed remains of plants and animals diffused through it. Now let us try to learn how these different materials have been brought together.

Every drop of rain which falls upon the land helps to alter the surface. You have followed the chemical action of rain when it dissolves parts of rocks. It is by the constant repetition of the process, drop after drop, and shower after shower, for years together, that the rocks become so wasted and worn. But the rain has also a mechanical action.

Watch what happens when the first pattering drops of a shower begin to fall upon a smooth surface of sand, such as that of a beach. Each drop makes a little dint or impression. It thus forces aside the grains of sand. On sloping ground, where the drops can run together and flow downward, they are able to push or carry the particles of sand or clay along. This is called a mechanical action; while the actual solution of the particles, as you would dissolve sugar or salt, is a chemical action. Each drop of rain may act in either or both of these ways.

Now you will readily see how it is that rain does so much in the destruction of rocks. It not only dissolves out some parts of them, and leaves a crumbling crust on the surface, but it washes away this crust, and thereby exposes a fresh surface to decay. There is in this way a continual pushing along of powdered stone over the earth's surface. Part of this material accumulates in hollows, and on sloping or level ground; part is swept into the rivers, and carried away into the sea. As the mouldering of the surface of the land is always going on, there is a constant formation of soil. Indeed, if this were not the case, if after a layer of soil had been formed upon the ground, it were to remain there unmoved and unrenewed, the plants would by degrees take out of it all the earthy materials they could, and leave it in a barren or exhausted state. But some of it is being slowly carried away by rain, fresh particles from mouldering rocks are being washed over it by the same agent, while the rock or sub-soil underneath is all the while decaying into soil. The loose stones, too, are continually crumbling down and making new earth. And thus, day by day, the soil is slowly renewed.

Plants, also, help to form and renew the soil. They send their roots among the grains and joints of the stones, and loosen them. Their decaying fibers supply most of the carbonic acid by which these stones are attacked, and furnish also most of the organic matter in the soil. Even the common worms, which you see when you dig up a spadeful of earth, are of great service in mixing the soil and bringing what lies underneath up to the surface.

One part of the rain sinks under the ground, and you have traced its progress there until it comes to the surface again. You have now to trace, in a similar way, the other portion of the rainfall which flows along the surface in brooks and rivers.

You can not readily meet with a better illustration of this subject than that which is furnished by a gently sloping road during a heavy shower of rain. Let us suppose that you know such a road, and that just as the rain is beginning you take up your station at some part where the road has a well-marked descent. At first you notice that each of the large heavy drops of rain makes in the dust, or sand, one of the little dints or rain-prints already described. As the shower gets heavier these rain-prints are effaced, and the road soon streams with water. Now mark in what manner the water moves.

Looking at the road more narrowly, you remark that it is full of little roughnesses—at one place a long rut, at another a projecting stone, with many more inequalities which your eye could not easily detect when the road was dry, but which the water at once discloses. Every little dimple and projection affects the

flow of the water. You see how the raindrops gather together into slender streamlets of running water which course along the hollows, and how the jutting stones and pieces of earth seem to turn these streamlets now to one side and now to another.

Toward the top of the slope only feeble runnels of water are to be seen. But further down they become fewer in number, and at the same time larger in size. They unite as they descend; and the larger and swifter streamlets at the foot of the descent are thus made up of a great many smaller ones from the higher parts of the slope.

Why does the water run down the sloping road? why do rivers flow? and why should they always move constantly in the same direction? They do so for the same reason that a stone falls to the ground when it drops out of your hand; because they are under the sway of that attraction toward the center of the earth, to which, as you know, the name of gravity is given. Every drop of rain falls to the earth because it is drawn downward by the force of this attraction. When it reaches the ground it is still, as much as ever, under the same influence; and it flows downward in the readiest channel it can find. Its fall from the clouds to the earth is direct and rapid; its descent from the mountains to the sea, as part of a stream, is often long and slow; but the cause of the movement is the same in either case. The winding to and fro of streams, the rush of rapids, the roar of cataracts, the noiseless flow of the deep sullen currents, are all proofs how paramount is the sway of the law of gravity over the waters of the globe.

Drawn down in this way by the action of gravity, all that portion of the rain which does not sink into the earth must at once begin to move downward along the nearest slopes, and continue flowing until it can get no further. On the surface of the land there are hollows called lakes, which arrest part of the flowing water, just as there are hollows on the road which serve to collect some of the rain. But in most cases they let the water run out at the lower end as fast as it runs in at the upper, and therefore do not serve as permanent resting places for the water. The streams which escape from lakes go on as before, working their way to the seashore. So that the course of all streams is a downward one; and the sea is the great reservoir into which the water of the land is continually pouring.

The brooks and rivers of a country are thus the natural drains, by which the surplus rainfall, not required by the soil or by springs, is led back again into the sea. When we consider the great amount of rain, and the enormous number of brooks in the higher parts of the country, it seems, at first, hardly possible for all these streams to reach the sea without overflowing the lower grounds. But this does not take place; for when two streams unite into one, they do not require a channel twice as broad as either of their single water-courses. On the contrary, such an union gives rise to a stream which is not so broad as either of the two from which it flows. But it becomes swifter and deeper.

Let us return to the illustration of the roadway in rain. Starting from the foot of the slope, you found the streamlets of rain getting smaller and smaller, and when you came to the top there were none at all. If, however, you were to descend the road on the other side of the ridge, you would probably meet with other streamlets coursing down-hill in the opposite direction. At the summit the rain seems to divide, part flowing off to one side, and part to the other.

In the same way, were you to ascend some river from the sea, you would watch it becoming narrower as you traced it inland, and branching more and more into tributary streams, and these again subdividing into almost endless little brooks. But take any of the branches which unite to form the main stream, and trace it upward. You come, in the end, to the first beginnings of a little brook, and going a little further you reach the summit, down the other side of which all the streams are flowing to the opposite quarter. The line which separates two sets of streams in this way is called the water-shed. In England, for

example, one series of rivers flows into the Atlantic, another into the North Sea. If you trace upon a map a line separating all the upper streams of the one side from those of the other, that line will mark the water-shed of the country.

But there is one important point where the illustration of the road in rain quite fails. It is only when rain is falling, or immediately after a heavy shower, that the rills are seen upon the road. When the rain ceases the water begins to dry up, till in a short time the road becomes once more firm and dusty. But the brooks and rivers do not cease to flow when the rain ceases to fall. In the heat of summer, when perhaps there has been no rain for many days together, the rivers still roll on, smaller usually than they were in winter, but still with ample flow. What keeps them full? If you remember what you have already been told about underground water, you will answer that rivers are fed by springs as well as by rain.

Though the weather may be rainless, the springs continue to give out their supplies of water, and these keep the rivers going. But if great drought comes, many of the springs, particularly the shallow ones, cease to flow, and the rivers fed by them shrink up or get dry altogether. The great rivers of the globe, such as the Mississippi, drain such vast territories, that any mere local rain or drought makes no sensible difference in their mass of water.

In some parts of the world, however, the rivers are larger in summer and autumn than they are in winter and spring. The Rhine, for instance, begins to rise as the heat of summer increases, and to fall as the cold of winter comes on. This happens because the river has its source among snowy mountains. Snow melts rapidly in summer, and the water which streams from it finds its way into the brooks and rivers, which are thereby greatly swollen. In winter, on the other hand, the snow remains unmelted; the moisture which falls from the air upon the mountains is chiefly snow; and the cold is such as to freeze the brooks. Hence the supplies of water at the sources of these rivers are, in winter, greatly diminished, and the rivers themselves become proportionately smaller.

[To be continued.]

SUNDAY READINGS.

Selected by REV. J. H. VINCENT, D.D.

[Sunday, November 4.]

MORAL DISTINCTIONS NOT SUFFICIENTLY REGARDED IN SOCIAL INTERCOURSE.

"He that walketh with wise men shall be wise; but a companion of fools shall be destroyed."—*Proverbs xiii: 20.*

That "a man may be known by the company he keeps," has passed into a proverb among all nations, thus attesting what has been the universal experience. The fact would seem to be that a man's associates either find him, or make him like themselves. An acute but severe critic of manners, who was too often led by his disposition and circumstances to sink the philosopher in the satirist, has said: "Nothing is so contagious as example. Never was there any considerable good or ill action, that hath not produced its like. We imitate good ones through emulation; and bad ones through that malignity in our nature, which shame conceals, and example sets at liberty."

This being the case, or anything like it, all, I think, must agree that moral distinctions are not sufficiently cared for in social intercourse. In forming our intimacies we are sometimes determined by the mere accident of being thrown together; sometimes by a view to connections and social position; sometimes by the fascination of what are called companionable qualities; seldom, I fear, by thoughtful and serious regard to the influence they are likely to have on character. We forget that other attractions, of whatsoever nature, instead of compensating for moral unfitness in a companion, only have the effect to make such unfitness the more to be dreaded.

Let me introduce what I have to say on the importance of paying more regard to moral distinctions in the choice of friends, by a few remarks on what are called, by way of distinction, companionable qualities, and on the early manifestation of a free, sociable, confiding turn of mind. Most parents hail the latter, I believe, as the best of prognostics; and in some respects it is. It certainly makes the child more interesting as a child, and more easily governed; it often passes for precocity of talent; at any rate, men are willing to construe it into evidence of the facility with which he will make his way in the world. The father is proud of such a son; the mother idolizes him. If from any cause he is brought into comparison with a reserved, awkward, and unyielding boy in the neighborhood, they are ready enough to felicitate themselves, and others are ready enough to congratulate them, on the difference. And yet I believe I keep within bounds, when I say that, of the two, there is more than an even chance that the reserved, awkward, and unyielding boy will give his parents less occasion for anxiety and mortification, and become in the end the wiser and better man. The reason is, that if a child from natural facility of disposition is easily won over to good courses, he is also, from the same cause, liable at any time to be seduced from these good courses into bad ones. On the contrary, where a child, from rigor or stubbornness of temper, is peculiarly hard to subdue or manage, there is this hope for a compensation: if by early training, or the experience of life, or a wise foresight of consequences, he is once set right, he is almost sure to keep so.

It is not enough considered, that, in the present constitution of society, men are not in so much danger from want of good dispositions, as from want of firmness and steadiness of purpose. Hence it is that gentle and affectionate minds, more perhaps than any others, stand in need of solid principle and fixed habits of virtue and piety, as a safeguard against the lures and fascinations of the world. A man of a cold, hard, and ungenial nature is comparatively safe so far as the temptations of society go: partly because of this very impracticableness of his nature, and partly because his companionship is not likely to be desired or sought even by the bad: he will be left to himself. The corrupters of innocence in social intercourse single out for their prey men of companionable qualities. Through his companionable qualities the victim is approached, and by his companionable qualities he is betrayed.

Let me not be misunderstood. Companionable qualities are not objected to *as such*. When they spring from genuine goodness of heart, and are the ornament of an upright life, they are as respectable as they are amiable; and it would be well if Christians and all good men cultivated them more than they do. If we would make virtue and religion to be loved, we must make *ourselves* to be loved *for* our virtue and religion; which would be done if we were faithful to carry the gentleness and charity of the gospel into our manners as well as into our morals. Nevertheless, we insist that companionable qualities, when they have no better source than a sociable disposition, or, worse still, an easy temper and loose principles, are full of danger to their possessor, and full of danger to the community; especially where, from any cause, but little regard is paid to moral distinctions in social intercourse. We also say, that in such a state of society the danger will be most imminent to those whom we should naturally be most anxious to save—I mean, persons of a loving and yielding turn of mind.

[Sunday, November 11.]

And this brings me back again to the position taken in the beginning of this discourse. The reason why companionable qualities are attended with so much danger is, that society itself is attended with so much danger; and the reason why society is attended with so much danger is, that social intercourse is not more under the control of moral principles, moral rules, and moral sanctions.

My argument does not make it necessary to exaggerate the evils and dangers of modern society. I am willing to suppose that there have been times when society was much less pure than it is now; and again, that there are places where it is much less pure than it is here; but it does not follow that there are no evils or dangers now and here. On the contrary, it is easy to see that there may be stages in the progressive improvement of society, where the improvement itself will have the effect, not to lessen, but to increase the danger, *so far as good men are concerned*. In a community where vice abounds, where the public manners are notoriously and grossly corrupt, good men are put on their guard. They will not be injured by such society, for they will have nothing to do with it. A broad line of demarcation is drawn between what is expected from good men, and what is expected from bad men; so that the example of the latter has no effect on the former except to admonish and to warn. But let the work of refinement and reform go on in general society until vice is constrained to wear a decent exterior, until an air of decorum and respectability is thrown over all public meetings and amusements, and one consequence will be that the distinction between Christians and the world will not be so clearly seen, or so carefully observed, as before. The standard of the world, from the very fact that it is brought nearer to the standard of the gospel, will be more frequently confounded with it; Christians will feel at liberty to do whatever the world does, and the danger is, that they will come at length to do it from the same principles.

Besides, are we sure that we have not formed too favorable an opinion of the moral condition of general society—of that general society in the midst of which we are now living, and to the influence of which we are daily and hourly exposed? We should remember that in pronouncing on the character of public opinion and public sentiment, we are very likely to be affected and determined ourselves, not a little, by the fact that we share in that very public opinion and public sentiment which we are called upon to judge. I have no doubt that virtue, in general, is esteemed by the world, or that, *other things being equal*, a man of integrity will be preferred on account of his integrity. But this is not enough. It shows that the multitude see, and are willing to acknowledge, the dignity and worth of an upright course; but it does not prove them to have that *abhorrence for sin*, which it is the purpose and the tendency of the gospel to plant in all minds. If they had this settled and rooted abhorrence for sin, which marks the Christian, and without which a man can not be a Christian, they would not prefer virtue to vice, “other things being equal,” but they would do so whether other things were equal or not; they would knowingly keep no terms with vice, however recommended or glossed over by interest or worldly favor, or refined and elegant manners.

Now, I ask whether general society, even as it exists amongst us, will bear this test? Is it not incontestable that very unscrupulous and very dangerous men, if they happen to be men of talents, or men of fashion, or men of peculiarly engaging manners, find but little difficulty in insinuating themselves into what is called good society; nay, are often among those who are most courted and caressed? Some vices, I know, are understood to put one under the social ban; but it is because they offend, not merely against morality and religion, but against taste, against good-breeding, against certain conventions of the world. To be convinced of this it is only necessary to observe that the same, or even a much larger amount of acknowledged criminality, manifested under other forms, is not found to be attended with the same result. The mischiefs of this state of things are felt by all; but especially by those who are growing up in what are generally accounted the most favored walks of life. On entering into society they see men of known profligacy mingling in the best circles, and with the best people, if not indeed on terms of entire sympathy and confidence, at least on those of the utmost possible respect and courtesy. They

see all this, and they see it every day; and it is by such flagrant inconsistencies in those they look up to for guidance, more perhaps than by any other one cause, that their own principles and their own faith are undermined. And besides, being thus encouraged and countenanced in associating with dissipated and profligate men in what is called good society, they will be apt to construe it into liberty to associate with them *anywhere*. At any rate the intimacy is begun. As society is constituted at present, corrupting intimacies are not infrequently begun amidst all the decencies of life, and, it may be, in the presence and under the countenance and sanction of parents and virtuous friends, which are afterward renewed and consummated, and this too by an easy, natural, and almost necessary gradation, amidst scenes of excess—perhaps in the haunts of ignominy and crime.

[Sunday, November 18.]

If one should propose a reform in this respect, I am aware of the difficulties and objections that would stand in his way.

Some would affirm it to be impracticable in the nature of things. They would reason thus: "The circle in which a man visits and moves is made for him, and not by him: at any rate, it is not, and can not be, determined by moral considerations alone. Something depends on education; something on family connections or mere vicinity; something on similarity in tastes and pursuits; something also on equality or approximation in wealth and standing. A poor man, or a man having a bare competency, if he is as virtuous and industrious, is just as *respectable* as a rich man; but it is plain that he can not pitch his style of living, or his style of hospitality, on the same scale of expense. It is better for both, therefore, that they should visit in different circles." Perhaps it is; but what then? I am not recommending an amalgamation of the different classes in society. I suppose that such an amalgamation would neither be practicable nor desirable in the existing state of things. All I contend for is, that in every class, open and gross immorality of any kind should exclude a man from reputable company. Will any one say that this is impracticable? Let a man, through untoward events, but not by any fault or neglect of his own, be reduced in his circumstances,—let a man become generally odious, not in consequence of any immorality, but because, perhaps, he has embraced the unpopular side in politics or religion—let a man omit some trifling formality which is construed into a vulgarity, or a personal affront, and people do not appear to find much difficulty in dropping the acquaintance. If, then; it is so easy a thing to drop a man's acquaintance for other reasons, and for no reason,—from mere prejudice, from mere caprice,—will it still be pretended that it can not be done at the command of duty and religion?

Again, it may be objected that, if you banish a man from general society for his immoralities, you will drive him to despair, and so destroy the only remaining hope of his reformation. What! are you going to *keep society corrupt* in the vain expectation that a corrupt state of society will help to reform its corrupt members? Besides, I grant that we should have compassion on the guilty; but I also hold that we should have compassion on the innocent too. Would you, therefore, allow a bad man to continue in good society, when the chances are a thousand to one that he will make others as bad as himself, and not more than one to a thousand that he himself will be reclaimed? Moreover, this reasoning is fallacious throughout. By expelling a dissipated and profligate man from good society, instead of destroying all hope of his recovery, you do in fact resort to the only remaining means of reforming one over whom a fear of God, and a sense of character, and the upbraidings of conscience have lost their power. What cares he for principle, or God, or an hereafter? Nothing, therefore, is so likely to encourage and embolden him to go on in his guilty course, as the belief that he will be allowed to do so without the forfeiture of the

only thing he does care for, his reputable standing in the world. On the other hand, nothing is so likely to arrest him in these courses, and bring him to serious reflection, as the stern and determined threat of absolute exclusion from good society, if he persists.

Another objection will also be made which has stronger claims on our sympathy and respect. We shall be told that the innocent as well as the guilty will suffer—the guilty man's friends and connections, who will probably feel the indignity more than he does himself. God forbid that we should needlessly add to the pain of those who are thus connected! But we must remember that the highest form of friendship does not consist in blindly falling in with the feelings of those whom we would serve, but in consulting what will be for their real and permanent good. If, therefore, the course here recommended has been shown to be not only indispensable to public morals, but more likely than any other to reclaim the offender, it is clearly not more a dictate of justice to the community, than of Christian charity to the parties more immediately concerned. Consider, also, how much is asked, when a good man is called upon to open his doors to persons without virtue and without principle. Unless the social circle is presided over by a spirit which will rebuke and frown away immorality, whatever fashionable names and disguises it may wear,—unless your sons and daughters can meet together without being in danger of having their faith disturbed by the jeers of the infidel, or their purity sullied by the breath of the libertine, neither they nor you are safe in the most innocent enjoyments and recreations. Parents at least should take a deep interest in this subject, if they do not wish to see the virtue, which they have reared under the best domestic discipline, blighted and corrupted before their eyes by the temptations to which their children are almost necessarily exposed in general society—a society which they can not escape except by going out of the world, and which they can not partake of without endangering the loss of what is of more value than a thousand worlds.

[Sunday, November 25.]

I have failed altogether in my purpose in this discourse if I have not done something to increase your distrust of mere companionable qualities, when not under the control of moral and religious principle; and also of the moral character and moral influence of general society, as at present constituted. Still you may ask, "If I associate with persons worse than myself, how can it be made out to be more probable that they will drag me down to their level, than that I shall lift them up to mine?" The answer to this question, I hardly need say, depends, in no small measure, on the reason or motive which induces the association. If you mix with the world, not for purposes of pleasure or self-advantage—if you resort to society, not for society as an end, but as a means to a higher end, *the improvement of society itself*—you do but take up the heavenly mission which Christ began. For not being able to make the distinction, through the hollowness and corruption of their hearts, the Pharisees thought it to be a just ground of accusation against our Lord, that he was willing to be accounted the friend of publicans and sinners. Let the same mind be in you that was also in Christ Jesus, and we can not doubt that the spirit which inspires you will preserve you wherever you may go. It is of such persons that our Lord has said: "Behold, I give unto you power to tread on serpents and scorpions, and over all the power of the enemy; and nothing shall by any means harm you." Very far am I, therefore, from denying that we may do good in society, as well as incur danger and evil. Even in common friendships frequent occasions will present themselves for mutual service, for mutual counsel and admonition. Let me impress upon you this duty. Perhaps there is not one among you all, who has not at this moment companions on whom he can confer an infinite blessing. If there is a weak

place in their characters, if to your knowledge they are contemplating a guilty purpose, if they are on the brink of entering into dangerous connections, by a timely, affectionate, and earnest remonstrance you may save them from ruin. *Remember, we shall all be held responsible, not only for the evil which we do ourselves, but for the evil which we might prevent others from doing; it is not enough that we stand; we must endeavor to hold up our friends.*

Very different from this, however, is the ordinary commerce of society; and hence its danger. If we mix with the world for the pleasure it affords, we shall be likely to be among the first to be reconciled to the freedom and laxity it allows. The world is not brought up to us, but we sink down to the world; the drop becomes of the consistence and color of the ocean into which it falls; the ocean remains itself unchanged. In the words of an old writer: "Though the well-disposed will remain some good space without corruption, yet time, I know not how, worketh a wound in him, which weakness of ours considered, and easiness of nature, apt to be deceived, looked into, they do best provide for themselves that separate themselves as far as they can from the bad, and draw as nigh to the good, as by any possibility they can attain to." "He that walketh with wise men shall be wise; but a companion of fools shall be destroyed."

POLITICAL ECONOMY.

By G. M. STEELE, D.D.

II.

PRODUCTION, CONTINUED — CAPITAL — COMBINATION AND DIVISION OF LABOR.

5. We have already seen that an essential to any considerable production is *capital*. We have seen the nature of capital and how it comes to exist. We have also learned that though capital implies saving, mere saving is not the sole condition of capital; indeed, a narrow penuriousness prevents the rapid accumulation of capital. The man who is accustomed to bring his water from a spring a quarter of a mile from his house instead of digging a well at the cost of a few dollars, or a few days' work, acts uneconomically. In the long run the bringing of the water from the spring costs him much more than the digging of the well. The man who has extensive grain-fields, and who, for the sake of saving the expense of a reaper, or even a cradle, continues to use the sickle, will find that his saving results in a loss instead of a gain.

A man does not need to be rich in order to be a capitalist. When the savage has invented a bow and arrows he has the rudiments of capital. The laborer who has reserved out of his earnings enough to buy him a set of tools, or a few acres of land, is as really a capitalist as the owner of factories or railroads. Whatever property is used for production is capital.

Capital exists in many forms. It has been generally divided into *fixed* and *circulating*, though the limits of these divisions are not very precisely defined. The main difference consists in this, that while certain kinds of capital are used only once in the fulfillment of their purposes, other kinds are used repeatedly. Fuel can be burned but once. An axe may serve for years. Circulating capital is of two kinds:

(1) There are the stock and commodities which are to be consumed in reproduction; (a) the material out of which the new product is to be made, as lumber for cabinet ware, leather for shoes, etc.; (b) food and other provisions for the sustenance of the laborers.

(2) There is the stock of completed commodities on hand and ready for the market. The chairs that are finished and ready for sale in the chair factory are of this character. It is to be observed that the same article may be at one time circulating and at another fixed capital. Thus the chairs just spoken of, while they are in the hands of the manufacturer, or passing

through those of the dealers, are circulating capital. It is only when they become *fixed in use* that their character changes.

Fixed capital consists (1) of all tools, implements, and machinery, used in the trades. Here, too, belong all structures of every sort for productive purposes; (2) all beasts of burden and draft; (3) all improvements of land implied in clearing, fencing, draining, fertilizing, terracing, etc.; (4) all mental acquisitions gained by labor and which give man power for productive results.

Obviously capital, by whomsoever owned, is an advantage to the laborer. But such capital is useless to the owner unless he can unite it with labor. So, too, the ability to labor is of no benefit to the laborer unless he can employ it in connection with capital. Generally the more capital there is in a community, other things being equal, the better it is for the laborer; and the more laborers there are, other things being equal, the better it is for the capitalist. When a factory burns down it may destroy only a small part of the wealth of the owners, and they may not palpably suffer; but it is very likely to deprive the laborers, who are connected with it, of the means of securing their daily sustenance.

There is no natural antagonism of interests between capital and labor, but rather the utmost concord and interdependence. Whatever conflicts arise between the laborers and the capitalists come from the unnatural selfishness and jealousy of the parties concerned.

6. As has been intimated, it is only by application of principles underlying political economy that we come to the conditions of the highest production, or, in other words, find how to satisfy the largest range of desires to the greatest extent at the smallest cost of labor. One of the chief means of effecting this is by *the combination and division of labor*. Recalling what was said concerning association and individuality, we shall see what principles are involved here, and how naturally they came into operation. As there was seen to be no antagonism between the two latter conceptions when carefully analyzed, so there is none, but rather the opposite, between combination and division of labor. It is true that there are instances where combination may take place without division, as when men unite to effect purposes which one could not accomplish except in much more than the proportionate time; as also in some cases to affect purposes which the individual could not effect in any length of time, such as the moving and placing of heavy timbers and stones, the management of ships and railway trains, etc. But for the most part men divide their labor in the process in order that they may combine the result. This is done in two ways:

(1) Men divide up the work of supplying human wants into different trades and occupations, according to their several tastes and aptitudes. Each man needs nearly the same that every other needs. But while each provides for only one kind of want, he provides more than enough to satisfy his own desire in that particular respect, and contributes the overplus to meet that same want in others. As all others do the same, each is contributing to meet the desires of one and all to each. The shoemaker, the tailor, the carpenter, the cabinet-maker, the blacksmith, the weaver, the paper-maker, the tin-man, the miner, the smelter, the painter, the glazier, etc., are all contributing to supply the farmer's needs, and the farmer is contributing to all their needs. The wants of all are many times more fully met in this way than if each one should undertake to supply all his own wants.

(2) In some complicated trades the work is divided into a number of processes. There are men who could do every one of these parts; but such men are few, and their labor very costly, because some of the parts require rare skill and talent. What is needed is to organize several grades of laborers, so that the physically strong, the intelligent and skillful may have the work that only they can do; the less strong and skillful may find employment in the lighter and easier parts, and so all grades of ability down to the delicate woman or the little child,

and up to the most powerful muscle and most advanced intelligence, can find their place. It is almost incredible how great is the increase of productiveness from the mere economical arrangement of workers. It is said that in so simple a matter as the making of pins, where the work is divided into ten processes and properly distributed, that the production will be *two hundred and forty times* as much as if each man did the whole work on each pin.

This connects itself with another important condition of large production. I mean the diversification of employment in a community. It is only in such a varied industry that all the varied tastes, aptitudes and abilities of society can find scope and adaptation; and without this, production must fall far short of its possibilities. This, too, is required to develop those differences which constitute individuality, and on which association depends.

There are other conditions of enlarged production, such as are implied in freedom, good government, and the moral character of the community, the influence of each of which will easily suggest itself to thoughtful minds.

III.—CONSUMPTION.

1. Consumption is the destruction of values. Production implies consumption. In general, all material is destroyed in entering into new forms of wealth. Thus, leather must be destroyed in order to the production of shoes. Flour must disappear in the manufacture of bread, and wheat in the making of flour. Every kind of implement, or machine or structure is consumed by use. This consumption is immediate, or by a single use; or it is gradual. The food that we eat and the fuel that we burn are examples of the former; tools, bridges, buildings and aqueducts are examples of the latter. It is accomplished in a few months or years; or is protracted through centuries.

2. Consumption is either *voluntary* or *involuntary*. Of the latter kind we have instances in the *natural decay* of objects, as in wood and vegetables; the rusting of iron, the mildew and the moth-eating of cotton and woolen fabrics, and the wearing away by attrition of gold, silver, and other metals; also the destruction caused by vermin. Much of this may be prevented by the prudent foresight which sound economy enjoins; yet much loss will inevitably take place. A great deal of consumption is *accidental*. Great destruction is caused by fires, steam-boiler explosions, floods and tornadoes, earthquakes and volcanic eruptions.

3. Voluntary consumption is either *productive* or *unproductive*. The former is when the material appears in new form and with a higher value, as cloth made into garments and iron into hardware and cutlery. Unproductive consumption occurs, both in the cases before mentioned of natural and accidental consumption, and in cases where gratification of desire is the sole object sought and achieved, as when one eats and drinks simply for the enjoyment, and without reference to the waste of nature or the nourishment of the system.

It is not altogether easy to discriminate between these two kinds of consumption. We readily see the difference between a man's drinking a quantity of whiskey, not because it will help him in the performance of any duty, but because he likes it, and the scattering of a quantity of seed over the ground in spring. There is no doubt that one act is productive and the other unproductive. But there are cases where the distinction is less clear.

It is not necessarily a case of unproductive consumption when one destroys value for the sake of gratifying some desire. Probably a majority of men eat and drink simply because they desire food and drink, having no thought of any ulterior object. Yet this eating and drinking is absolutely essential to productive labor. The wealth consumed in this way reappears, to a large extent, in the products of human industry.

Still there is much really unproductive consumption; a de-

struction of value, in the place of which no other value ever appears. There are, for instance, men and women—

* * * "who creep
Into this world to eat and sleep,
And know no reason why they 're born,
But simply to consume the corn."

Vast quantities of wealth are consumed in riotous living, in greedy and vulgar extravagance, and unmeaning magnificence. There is also much consumption designed to be productive, but failing of its end through misdirection. Large amounts of property are sometimes invested in enterprises which prove failures. This occurs partly from miscalculation or negligence, and partly from a disposition to trust to chances—the gambler's calculation. In these ways much wealth is consumed with no consequent product.

4. It is not easy to draw the line between the ordinary conveniences of life and its luxuries; nor can it be stated to what extent the latter in any sense of the term are economically allowable. What to one class of persons may be a luxury to another class may be almost a necessity. So what might in one age have been a rare and expensive indulgence, is in a more advanced period among the cheaper and more ordinary commodities. I call special attention to three kinds of consumption:

(1) There is the consumption necessary to life and the performance of productive labor. The word *necessary* here is used in its liberal rather than its restricted sense. The absolute necessities of human life are very few. It does not even require much to keep a man in working condition. But to keep him where there is a larger kind of living, and where his energies of both body and mind, together with the moral qualities which render him most efficient, are at their best, the consumption must be more generous.

Besides subsistence there must be materials, tools, machines, and a variety of conditions involving the destruction of value. It is desirable to sustain man not as a mere savage, but to give him the largest volume of human life; and the civilized man, it will be admitted, lives a broader life than the savage. We are not to forget that Political Economy aims at the increase of the value of man, more than at the multiplication of material wealth, or the increase of commerce, except as the latter are conditions of the former.

(2) A second kind of consumption is of such articles as minister to bodily enjoyment and meet certain mental appetencies of a lower order. They are not necessary to sustain life, nor to render it more efficient. On the contrary, they often impair the vigor and competence of the person. At the best they simply gratify certain desires without adding anything to the value of the man. To this category belong mere dainty food, gold and jewels, and other ornaments, valued solely because of their showiness and not for any artistic excellence; gay and costly apparel, in which the gayety and the costliness are the main features. These constitute a class of luxuries that are in nearly every sense non-productive. They favorably affect neither the individual nor society, and are for the most part hurtful to both.

(3) But not all consumption, the object of which is to gratify desire, is to be reckoned in this category. There are certain pleasures which ennoble and really enrich those who participate in them. There are desires the gratification of which enlarges the volume of one's being. They are related not so much to man's productive capability as to that which is the final cause of all production, and to which all wealth is only a means. The labor, material, implements, and whatever else is consumed in the production of the works or effects of genuine art, result in the most *real wealth* that exists. By this is meant not merely pictures, statues, books, carved work, tasteful tapestries, and similar objects which can be bought and sold, but also oratorics which you may hear but once; magnificent parks to which you may be admitted, but may never own; great actors and singers

whose genius may be exhibited to others, but not possessed by them. It is true that much which properly belongs here may be so consumed as to deserve only a place in the second class; but it may also have those higher and nobler uses which imply production in the best sense.

5. *Public consumption* is the expenditure of means for society in its aggregate capacity. It has reference principally to the support of those agencies which are implied in the term *government*. The reasons for the necessity of such expenditures have already been given. The purposes to which such consumption is properly applied may be grouped as follows:

(a) The support and administration of government. This embraces compensation to executive, legislative and judicial officers, and expenditure for public buildings. (b) For works of public convenience. Here are included the paving and lighting of streets, water-works and sewerage. (c) For advancing science and promoting intelligence, by means of exploring expeditions, geological surveys, meteorological and astronomical observations, etc. (d) For the promotion of popular education. (e) For the support of the poor and the relief of the afflicted. (f) For national defense.

6. The general law of economical consumption, both individual and public, is that only so much and such a quality should be consumed as is necessary to effect the purpose designed, whether that be further production or individual gratification. It is nearly the same in the case of labor. In relation to the work to be done, the character, ability and skill of the laborer should be considered.

READINGS IN ART.

II. SCULPTURE: GRECIAN AND ROMAN

While Egyptian sculpture was losing its individuality, and Assyrian was wearing itself out in excessive ornamentation, there was a new art growing up in the isles and on the eastern shores of the Mediterranean. The early centuries of its growth are hidden from our knowledge. The remains are so scanty, so imperfect, that it is with difficulty that we trace the influences which were molding the art, and the extent to which it was taking hold of the people. Of this primitive period but one single work of sculpture is preserved.

"At Mycenæ, once perhaps in the days of Homer (850-800? B. C.) the most important city of Greece, there are sculptural works in the remains of two lions over the entrance gate. The height of these is about ten feet, and the width fifteen feet. The stone is a greenish limestone. The holes show where the metal pins held the heads, long since decayed. Fragments as they are, they show an Assyrian rather than an Egyptian influence in the strong marking of the muscles and joints, softened though it is by decay, and in the erect attitude, which denotes action, such as is not seen in Egyptian art of this kind. Of this gate of the lions, which has long been known as the most ancient work of early Greek sculpture, it must be noticed that it is not in the round, but only in high relief. And this is the case with all the earliest works, just as it is with the Assyrian sculptures. They tend to show therefore that the Greek sculptor had not yet learnt to model and carve in the round in marble and stone."

In the objects found by Cesnola in Cyprus, and consisting of statues and other sculptures, incised gems, and metal work of the hammered-out kind, the resemblance to the art of Assyria is remarkable. Three hundred years later than the "gate of lions" are the reliefs discovered at Xanthus in Lycia. "They belong to the Harpy monument—a pier-shaped memorial, along the upper edge of which is a frieze ornamented in relief." The archaic is still visible in the figures. The drapery falls in long straight folds, with zigzag edges. There is the stiff, inevitable smile of the Egyptian statue. The figures are in motion, but both feet are set flat on the ground. Though in profile the eyes

are shown in full. In spite of these primitive absurdities, and the fact that the subjects represent foreign myths, the statues are Greek.

In the fifth century various art schools were founded. "In Argos lived Argeladas (515-455 B. C.), famous for his bronze statues of gods and Olympic victors, and still more famous for his three great pupils, Phidias, Myron, and Polycleitus. In Sicyon there lived, at the same time, Canachus, the founder of a vital and enduring school. He executed the colossal statue of Apollo at Miletus, and was skilled not only in casting bronze but in the use of gold and ivory and wood carving. Ægina, then a commercial island as yet not subjected, was rendered illustrious by the two masters Callon and Onatas, the latter especially known by several groups of bronze statues and warlike scenes from heroic legends. Lastly, Athens possessed among other artists Hegias, the teacher of Phidias and Critius. But all of these old masters were severe, hard, archaic in their treatment."

But a period approaches when by a freer, happier treatment of their work the way was led to the highest Athenian sculpture. We can but mention the leading sculptors, Calamis of Athens, Pythagoras of Rhegium, and, greatest of all, Myron of Athens. They do not belong to the epoch of the finest Grecian art, but they were the immediate forerunners.

"Now, for the first time in opposition to the barbarians, the national Hellenic mind rose to the highest consciousness of noble independence and dignity. Athens concentrated within herself, as in a focus, the whole exuberance and many-sidedness of Greek life, and glorified it into beautiful utility. The victory of the old time over the new was effected by the power of Phidias, one of the most wonderful artist minds of all times. He lived in the times of Athens' greatest prosperity, and to him Pericles gave the task of executing the magnificent works he had planned for adorning the city. Among the famous statues which Phidias wrought in carrying out these plans was that of Athene, the patron goddess of the Athenians. The booty which had been taken at Salamis was set aside for this purpose, and forty-four talents, equal to \$589,875 of our money, was spent in adorning the statue. The virgin goddess was standing erect; a golden helmet covered her beautiful and earnest head; a coat of mail, with the head of the Medusa carved in ivory concealed her bosom; and long, flowing, golden drapery enveloped her whole figure—a statue of Niké, six feet high, stood on the outstretched hand of the goddess. The undraped parts were formed of ivory; the eyes of sparkling precious stones; the drapery, hair, and weapons of gold. In it Phidias portrayed for all ages the character of Minerva, the serious goddess of wisdom, the mild protectress of Attica."

Still more than in this statue the austere maidenliness of the goddess was elevated into noble, intellectual beauty in a figure of Athene placed on the Acropolis by the Lemnians; so much so that an old epigram instituted a comparison with the Aphrodite of Praxiteles of Cnidus, and calls Paris "a mere cow-driver for not giving the apple to Athene."

The still more famous colossal statue by Phidias, the Zeus at Olympia in Elis, was his last great work. It was made between B. C. 438, the date of the consecration of the Parthenon statue, and B. C. 432, the year of his death, at Elis.

This was a seated statue of ivory and gold, 55 feet high, including the throne. Strabo remarks, that "if the god had risen he would have carried away the roof," and the height of the interior was about 55 feet; the temple being built on the model of the Parthenon at Athens, which was 64 feet to the point of the pediment.

The statue was seen in its temple by Paulus Æmilius in the second century B. C., who declared the god himself seemed present to him. Epictetus says that "it was considered a misfortune for any one to die without having seen the masterpiece of Phidias." In the time of Julian the Apostate (A. D. 361-363) "it continued to receive the homage of Greece in spite of

every kind of attack which the covert zeal of Constantine had made against polytheism, its temples, and its idols." This is the last notice we possess giving authentic information of this grand statue. Phidias is said to have executed many other statues: thirteen in bronze from the booty of Marathon, consecrated at Delphi under Cimon—statues of Apollo, Athene, and Miltiades, with those ten heroes who had given their names to the ten Athenian tribes (Eponymi); an Athene for the city of Pellene in gold and ivory; another for the Plataeans, of the spoils of Marathon, made of wood gilt, with the head, feet, and hands of Pentelic marble. "These," M. Rochette says, "may be considered the productions of his youth."

The great national work of the time, however, was the Parthenon, and the ornamentation was entrusted to Phidias. Not that all the wonderful statues were executed by him alone. He had his pupils and associates. The most famous of these seems to have been Alcámenes, a versatile and imaginative disciple of his master. After him were Agoracritus and Pæonius. There were many others who assisted in the work. The outside of the temple was ornamented with three classes of sculpture: (1) The sculptures of the pediments, being independent statues resting on the cornices. (2) The groups of the metopes, ninety-two in number. These were in high relief. (3) The frieze around the upper border of the cella of the Parthenon contained a representation in low relief of the Panathenaic procession. All these classes of sculpture were in the highest style of the art.

The influence of the sculptures of the Parthenon is seen in many directions in the temple of Apollo at Phigalia, the temple of Niké-Apteros on the Acropolis at Athens, at Halicarnassus, etc.

"The works which are known to have been executed by the sculptors contemporary with Phidias, and by others who formed what is spoken of as 'the later Athenian school,' did not approach the great examples of the Parthenon. Sculpture then reached the highest point in the grandest style, whether in the treatment of the statue in the round, or of bas-relief as in the frieze, or alto-relievo as in the metopes. As to the chryselephantine statues of Phidias, it may be concluded without hesitation that though we are compelled to rely upon descriptions only, they must have been works of the great master even more beautiful than the marbles."

At Argos during the time of Phidias, a somewhat younger school flourished under the leadership of Polycleitus. "The aspiration of Polycleitus was to depict the perfect beauty of the human form in calm repose." His Amazon and Juno represent best his style; so perfect are all his works in their proportions that the invention of the canon has been assigned to him.

In the works of the later Athenian school, at the head of which were Scopas and Praxiteles, the sublime ideal of Greek art was no longer sustained by any new creations that can be compared with those of the Phidian school; no rivalry with those great masters seemed to be attempted. The severe and grand was beyond the comprehension, or probably uncongenial to the spirit of the age, which inclined toward the poetic, the graceful, the sentimental and romantic. The whole range of the beautiful myths found abundant illustration in forms entirely different from the ancient archaic representations, and in these the fancy of the sculptor was allowed the fullest and freest indulgence. Nymphs, nereids, mænads, and bacchantes occupied the chisel of the sculptor in every form of graceful beauty.

After this epoch, to which so many of the fine statues belong—repetitions in marble of famous originals in bronze—Greek sculpture took another phase in accordance with the social life and the taste of the age, which inclined toward the feeling for display that arose with the domination of the Macedonian power, brought to its height by the conquests and ambition of Alexander the Great. Lysippus, a self-taught sculptor of Sicyon, was the leading artist of his time. He was evidently a

student of nature and individual character, as he was the first to become celebrated for his portraits, especially those of Alexander. He departed from the severe and grand style, and in the native conceit of all self-taught men sneered at the art of Polycleitus in the well-known saying recorded of him, "Polycleitus made men as they were, but I make them as they ought to be." He seems to have been the first great naturalistic sculptor.

Rhodes had unquestionable right to give her name to a school of sculpture, both from the great antiquity of the origin of the culture of the arts in the island, and from the number, more than one hundred, of colossal statues in bronze. The Rhodian school is also distinguished by those remarkable examples of sculpture in marble of large groups of figures—the Toro Farnese and the Laocoon. In these works there is the same feeling for display of artistic accomplishment that has been noticed as characteristic of the Macedonian age, with that effort at the pathetic, especially in the Laocoon, which belongs to the finer style of the later Athenian school as displayed in the works of Scopas and Praxiteles, in the Niobe figures and others.

At Pergamus, another school allied in style to that of Ephesus arose, of which the chief sculptor was Pyromachus, who, according to Pliny, flourished in the 120th Olympiad, B. C. 300–298. A statue of Æsculapius by Pyromachus was a work of some note in the splendid temple at Pergamus, and is to be seen on the coins of that city. It is also conjectured that the well-known Dying Gladiator is a copy of a bronze by Pyromachus. The vigorous naturalistic style of these statues, surpassing anything of preceding schools in the effort at expression, may be taken as characteristic of the school of Pergamus, then completely under Roman influence, and destined to become more so. But all question as to the nature of the sculptures was set at rest by the discovery of many large works in high relief by the German expedition at Pergamus in 1875. These are now in the Museum at Berlin. They are of almost colossal proportions, representing, as Pliny described, the wars of Attalus and the Battles with the Giants. The nude figure is especially marked by the effort to display artistic ability as well as great energy in the action. In these points there is observable a connection with the well-known and very striking example of sculpture of this order—the Fighting Gladiator, or more properly the Warrior of Agasias, who, as is certain from the inscription on his work, was an Ephesian.

The equally renowned statue of the Apollo Belvedere, finely conceived and admirably modeled as it undoubtedly is, bears the stamp of artistic display which removes it from the style of the great classic works of sculpture.

The history of Roman sculpture is soon told. If it have any real roots, they are to be traced in the ancient Etruscan; for all that was really characteristic in it as art is associated with that style, in that intense naturalism which became developed so strikingly in the production of portrait statues and busts, and in those great monumental works in bas-relief which are marked by the same strong feeling for descriptive representation of the most direct and realistic kind, upon their triumphal columns and arches.

As has already been stated, early Roman sculpture, if such it can be called, was entirely the work of Etruscan artists, employed by the wealth of Rome to afford the citizens that display of pomp in their worship of the gods and the triumphs of their warriors which their ambition demanded. All important works were made of colossal size. Some of the early Roman (quasi Etruscan) statues spoken of by the historians are a bronze colossus of Jupiter, an Etruscan bronze colossus of Apollo, eighty feet high, in the Palatine Library of the temple of Augustus. A portrait statue of an orator in the toga, and a chimæra, both of bronze, are in the Florence Museum. Sculpture, from the love of it as a means of expressing the beautiful in the ideal form of the deities or the heroic and the pathetic of humanity, never ex-

isted as a growth of Roman civilization. The inclination of the Roman mind was toward social, municipal, and imperial system and ordering; in this direction the Romans were inventors and improvers upon that which they borrowed from the Greeks. But in art they began by hiring, and they ended by debasing the work of the hired.

They took away the bronze statues of Greece as trophies of conquest, covered them with gold, and set them up in the palaces and public places of Rome. They subsidized the sculptors of Greece, who under Roman influence had fallen away from their high traditions; they did nothing for the sake of art, but simply manufactured, as it were, copies and imitations of Greek statues for their own use. Happily we have to be grateful for the fact, though we can not honor the motive. Had it not been for this bestowal of their wealth in the gratification of their taste for luxury and display, many of the renowned statues of ancient Greek art would have been known only by the vague mention of them by Pausanias and Pliny, or the early Christian writers of the Church, or the poetic allusions of the Greek anthologists and the Latin epigrammatists.

The Column of Trajan was the great work of Apollodorus, the favorite architect of the emperor, dedicated A. D. 114. It is 10½ feet in diameter and 127 feet high, made of thirty-four blocks of white marble, twenty-three being in the shaft, nine in the base, which is finely sculptured, and two in the capital and torus. The reliefs at the base are smaller than those toward the top, being two feet high, increasing to nearly four as they approach the summit; this was, of course, to enable the more distant subjects to be seen equally well with the others, a singular illustration of the intensely practical turn of Roman art in its application. There are about 2,500 figures, not counting horses, representing the battles and sieges of the Dacian war. The column of M. Aurelius Antoninus, erected A. D. 174, is similar in height, but the sculptures, although in higher relief, are not so good. They represent the conquest of the Marcians.

The Augustan age (B. C. 36–A. D. 14), favorable as it was to literature, only contributed to the multiplying of copies of the Greek statues, such as we see in so many instances, some of which are of great excellence, and inestimable as reliable evidence of fine Greek sculpture. These copies were sometimes varied by the sculptor in some immaterial point of detail.

Nero (A. D. 54–68) is said to have adorned his Golden House with no less than 500 statues, brought from Delphi. In the Baths of Titus, still in existence (they were built on the ground of the house and gardens of Mæcenas), many valuable statues have been discovered. The Arch of Titus furnishes an excellent example of bas-relief of that time, in it the golden candlestick and other spoils from the temple of Jerusalem are shown.

Hadrian (A. D. 117–138) encouraged the reproduction of the Greek statues, with great success as regards execution, for his famous villa at Tivoli, and besides these are the statues of his favorite Antinous, which are the most original works of the time. Hadrian's imperial and liberal promotion of sculpture, gave an immense impetus to the production of statues of every form. All the towns of Greece which he favored made bronze portrait statues of him, which were placed in the temple of Jupiter Olympius at Athens, and the enclosure round more than half a mile in extent was filled with its many statues.

The learned Varro speaks of Arcesilaus as the sculptor of Venus Genetrix, in the forum of Cæsar, and of a beautiful marble group of Cupids playing with a lioness, some leading her, others beating her with their sandals, others offering her wine to drink from horns.

Under the Antonines arose the outrageous fashion of representing noble Romans and their wives as deities, and this was carried so far that the men are not unfrequently nude as if heroic. The bas-reliefs on the arch of Septimius Severus at Rome, and that which goes by the name of Constantine—though made

chiefly of reliefs belonging to one raised in honor of Trajan—show the poor condition of sculpture at that time. The numerous sarcophagi, some made by Greek sculptors for the Roman market, and others by those working at Rome, are other examples of the feeble style of imitators and workmen actuated by no knowledge or feeling of art. Some of these are still to be seen in the collections at Rome, with mythological subjects, the heads being left unfinished, so that the portraits of the family could be carved when required.

The rule of Constantine was, however, far more disastrous to art as the seat of the Empire was removed to Byzantium. Most of the finest statues accumulated in Rome were removed there only to be lost forever in the plundering of wars and the fanatical rage of the Christian iconoclasts. While destroying the statues of the gods, they may have spared those which commemorated agonistic victors; but we may be sure that nearly all the works in metal which the Christians spared were melted down by the barbarous hordes of Gothic invaders, who under Alaric occupied the Morea about A. D. 395.

With this glance at the complete decadence of art and the coming darkness that preceded its revival, we approach the subject of sculpture as connected with the rise of ecclesiastical religious art, which is necessarily reserved for further consideration.

SELECTIONS FROM AMERICAN LITERATURE.

BENJAMIN FRANKLIN.

I recommend the study of Franklin to all young people; he was a real philanthropist, a wonderful man. It was said that it was honor enough to any one country to have produced such a man as Franklin.—*Sydney Smith*.

A man who makes a great figure in the learned world; and who would still make a greater figure for benevolence and candor were virtue as much regarded in this declining age as knowledge.—*Lord Kames*.

He was a great experimental philosopher, a consummate politician, and a paragon of common sense.—*Edinburgh Review*.

He has in no instance exhibited that false dignity by which science is kept aloof from common application; and he has sought rather to make her an useful inmate and servant in the common habitations of man, than to preserve her merely as an object of admiration in temples and palaces.—*Sir Humphrey Davy*.

His style has all the vigor, and even conciseness of Swift, without any of his harshness. It is in no degree more flowery, yet both elegant and lively.—*Lord Jeffrey*.

When he left Passy it seemed as if the village had lost its patriarch.—*Thomas Jefferson*.

Extracts From Poor Richard's Almanac.

"Love well, whip well." "The proof of gold is fire; the proof of woman, gold; the proof of man, a woman." "There is no little enemy." "Necessity never made a good bargain." "Three may keep a secret, if two of them are dead." "Deny self for self's sake." "Keep thy shop, and thy shop will keep thee." "Here comes the orator, with his flood of words and his drop of reason." "Sal laughs at everything you say; why? because she has fine teeth." "An old young man will be a young old man." "He is no clown that drives the plow, but he that does clownish things." "Diligence is the mother of good luck." "Wealth is not his that has it, but his that enjoys it." "He that can have patience can have what he will." "Good wives and good plantations are made by good husbands." "God heals, the doctor takes the fee." "The noblest question in the world is, What good may I do in it?" "There are three faithful friends, an old wife, an old dog, and ready money." "Who has deceived thee so oft as thyself?" "Fly pleasures, and they will follow you." "Hast thou virtue? Acquire also the graces and beauties of virtue." "Keep your eyes wide open before

marriage; half shut afterward." "As we must account for every idle word, so we must for every idle silence." "Search others for their virtues, thyself for thy vices." "Grace thou thy house, and let not that grace thee." "Let thy child's first lesson be obedience, and the second will be what thou wilt." "Let thy discontents be thy secrets." "Happy that nation, fortunate that age, whose history is not diverting." "There are lazy minds, as well as lazy bodies." "Tricks and treachery are the practice of fools, who have not wit enough to be honest." "Let no pleasure tempt thee, no profit allure thee, no ambition corrupt thee, no example sway thee, no persuasion move thee, to do anything which thou knowest to be evil; so shalt thou always live jollily, for a good conscience is a continual Christmas."

"Altho' thy teacher act not as he preaches,
Yet ne'ertheless, if good, do what he teaches;
Good counsel failing men may give, for why?
He that's aground knows where the shoal doth lie.
My old friend Berryman, oft when alive,
Taught others thrift, himself could never thrive.
Thus like the whetstone, many men are wont
To sharpen others while themselves are blunt."

Poetry for December, 1834.

"He that for the sake of drink neglects his trade,
And spends each night in taverns till 'tis late,
And rises when the sun is four hours high,
And ne'er regards his starving family,
God in his mercy may do much to save him,
But, woe to the poor wife, whose lot it is to have him."

An Astronomical Notice.

During the first visible eclipse *Saturn* is retrograde: for which reason the crabs will go sidelong, and the rope-makers backward. Mercury will have his share in these affairs, and so confound the speech of the people, that when a *Pennsylvanian* would say *panther*, he shall say *painter*. When a *New Yorker* thinks to say *this*, he shall say *diss*, and the people in *New England* and *Cape May* will not be able to say *cow* for their lives, but will be forced to say *keow*, by a certain involuntary twist in the root of their tongues. No *Connecticut man* nor *Marylander* will be able to open his mouth this year but *si* shall be the first or last syllable he pronounces, and sometimes both. Brutes shall speak in many places, and there will be about seven and twenty irregular verbs made this year if grammar don't interpose. Who can help these misfortunes? This year the stone-blind shall see but very little; the deaf shall hear but poorly; and the dumb sha'n't speak very plain. As to old age, it will be incurable this year, because of the years past. And toward the fall some people will be seized with an unaccountable inclination to roast and eat their own ears: Should this be called madness, doctors? I think not. But the worst disease of all will be a most horrid, dreadful, malignant, catching, perverse, and odious malady, almost epidemical, inasmuch that many shall seem mad upon it. I quake for very fear when I think on't; for I assure you very few shall escape this disease, which is called by the learned Albomazer—*Lacko'mony*.

GEORGE WASHINGTON.

His papers which have been preserved show how he gained the power of writing correctly—always expressing himself with clearness and directness, often with felicity and grace.—*George Bancroft*.

No one who has not been in England can have an idea of the admiration expressed among all parties for General Washington.—*Rufus King*, 1797.

* * * The great central figure of that unparalleled group, that "noble army" of chieftains, sages, and patriots, by whom the revolution was accomplished.—*Edward Everett*.

He had in his composition a calm which gave him in moments of

highest excitement the power of self-control, and enabled him to excel in patience.—*Bancroft*.

Account of the Battle of Trenton.

HEADQUARTERS, MORRISTOWN, Dec. 27, 1776.

To the President of Congress:

SIR—I have the pleasure of congratulating you upon the success of an enterprise which I had formed against a detachment of the enemy lying in Trenton, and which was executed yesterday morning.

The evening of the twenty-fifth I ordered the troops intended for this service to parade back of McKonkey's ferry, that they might begin to pass as soon as it grew dark, imagining we should be able to throw them all over, with the necessary artillery, by twelve o'clock, and that we might easily arrive at Trenton by five in the morning, the distance being about nine miles. But the quantity of ice made that night impeded the passage of the boats so much that it was three o'clock before the artillery could all be got over; and near four before the troops took up their line of march.

This made me despair of surprising the town, as I well knew we could not reach it before the day was fairly broke. But as I was certain there was no making a retreat without being discovered, and harassed on re-passing the river, I determined to push on at all events. I formed my detachment into two divisions, one to march by the lower or river road, the other by the upper or Pennington road. As the divisions had nearly the same distance to march, I ordered each of them, immediately upon forcing the out-guards, to push directly into the town, that they might charge the enemy before they had time to form.

The upper division arrived at the enemy's advanced post exactly at eight o'clock: and in three minutes after I found, from the fire on the lower road, that that division had also got up. The out-guards made but small opposition, though, for their numbers, they behaved very well, keeping up a constant retreating fire from behind houses. We presently saw their main body formed; but from their motions, they seemed undetermined how to act.

Being hard pressed by our troops, who had already got possession of their artillery, they attempted to file off by a road on their right, leading to Princeton. But, perceiving their intention, I threw a body of troops in their way; which immediately checked them. Finding, from our disposition, that they were surrounded, and that they must inevitably be cut to pieces if they made any further resistance, they agreed to lay down their arms. The number that submitted in this manner was twenty-three officers and eight hundred and eighty-six men. Colonel Rahl, the commanding officer, and seven others, were found wounded in the town. I do not exactly know how many they had killed; but I fancy not above twenty or thirty, as they never made any regular stand. Our loss is very trifling indeed—only two officers and one or two privates wounded.

I find that the detachment consisted of the three Hessian regiments of Lanspach, Kniphausen, and Rahl, amounting to about fifteen hundred men, and a troop of British light horse; but immediately upon the beginning of the attack, all those who were not killed or taken pushed directly down toward Bordentown. These would likewise have fallen into our hands could my plan have been completely carried into execution.

General Ewing was to have crossed before day at Trenton ferry, and taken possession of the bridge leading out of town; but the quantity of ice was so great that, though he did every thing in his power to effect it, he could not get over. This difficulty also hindered General Cadwallader from crossing with the Pennsylvania militia from Bristol. He got part of his foot over; but finding it impossible to embark his artillery, he was obliged to desist.

I am fully confident that, could the troops under Generals Ewing and Cadwallader have passed the river, I should have been able, with their assistance, to have driven the enemy from

all their posts below Trenton. But the numbers I had with me being inferior to theirs below me, and a strong battalion of light infantry being at Princeton above me, I thought it most prudent to return the same evening with the prisoners and the artillery we had taken. We found no stores of any consequence in the town.

In justice to the officers and men, I must add that their behavior upon this occasion reflects the highest honor upon them. The difficulty of passing the river in a very severe night, and their march through a violent storm of snow and hail, did not in the least abate their ardor; but when they came to the charge each seemed to vie with the other in pressing forward; and were I to give a preference to any particular corps I should do great injustice to the others.

Colonel Baylor, my first aid-de-camp, will have the honor of delivering this to you; and from him you may be made acquainted with many other particulars. His spirited behavior upon every occasion requires me to recommend him to your particular notice.

I have the honor to be, etc.,

G. W.

THOMAS JEFFERSON.

As a composition, the Declaration [of Independence] is Mr. Jefferson's. It is the production of his mind, and the high honor of it belongs to him clearly and absolutely. To say that he performed his great work well would be doing him an injustice. To say that he did excellently well, admirably well, would be inadequate and halting praise. Let us rather say that he so discharged the duty assigned him that all Americans may well rejoice that the work of drawing the title-deed of their liberties devolved upon him.—*Daniel Webster.*

After Washington and Franklin there is no person who fills so eminent a place among the great men of America as Jefferson.—*Lord Brougham.*

Washington.

His mind was great and powerful, without being of the very first order; his penetration strong, though not so acute as that of a Newton, Bacon, or Locke; and as far as he saw, no judgment was ever sounder. It was slow in operation, being little aided by invention or imagination, but sure in conclusion. Hence the common remark of his officers, of the advantage he derived from councils of war, where, hearing all suggestions, he selected whatever was best; and certainly no general ever planned his battles more judiciously. But if deranged during the course of the action, if any member of his plan was dislocated by sudden circumstances, he was slow in a re-adjustment. The consequence was, that he often failed in the field, and rarely against an enemy in station, as at Boston and York. He was incapable of fear, meeting personal dangers with the calmest unconcern. Perhaps the strongest feature in his character was prudence, never acting until every circumstance, every consideration was maturely weighed; refraining if he saw a doubt, but when once decided, going through with his purpose, whatever obstacles opposed. His integrity was most pure, his justice the most inflexible I have ever known; no motives of interest or consanguinity, of friendship or hatred, being able to bias his decision. He was, indeed, in every sense of the word, a wise, a good, and a great man. His temper was naturally irritable and high-toned; but reflection and resolution had obtained a firm and habitual ascendancy over it. If ever, however, it broke its bounds, he was most tremendous in his wrath. In his expenses he was honorable, but exact; liberal in contributions to whatever promised utility; but frowning and unyielding on all visionary projects, and all unworthy calls on his charity. His heart was not warm in its affections; but he exactly calculated every man's value, and gave him a solid esteem proportioned to it. His person, you know, was fine, his stature exactly what one would wish; his deportment easy, erect, and noble, the best horseman of his age, and the most graceful figure that

could be seen on horseback. Although in the circle of his friends, where he might be unreserved with safety, he took a free share in conversation, his colloquial talents were not above mediocrity, possessing neither copiousness of ideas nor fluency of words. In public, when called on for a sudden opinion, he was unready, short, and embarrassed. Yet he wrote readily, rather diffusely, in an easy and correct style. This he had acquired by conversation with the world, for his education was merely reading, writing, and common arithmetic, to which he added surveying at a later day. His time was employed in action chiefly, reading little, and that only in agriculture and English history. His correspondence became necessarily extensive, and with journalizing his agricultural proceedings, occupied most of his leisure hours within doors. On the whole, his character was, in its mass, perfect, in nothing bad, in a few points indifferent; and it may truly be said, that never did nature and fortune combine more completely to make a man great, and to place him in the same constellation with whatever worthies have merited from man an everlasting remembrance. For his was the singular destiny and merit of leading the armies of his country successfully through an arduous war, for the establishment of its independence; of conducting its councils through the birth of a government, new in its forms and principles, until it had settled down into a quiet and orderly train; and of scrupulously obeying the laws through the whole of his career, civil and military, of which the history of the world furnishes no other example.

THOUGHTS FROM WILLIAM ELLERY CHANNING.

ON BOOKS.—It is chiefly through books that we enjoy intercourse with superior minds and these invaluable means of communication are in the reach of all. In the best books great men talk to us, give us their most precious thoughts, and pour their souls into ours.

God be thanked for books! They are the voices of the distant and the dead, and make us heirs of the spiritual life of past ages.

Books are the true levelers. They give to all who will faithfully use them, the society, the spiritual presence of the best and greatest of our race. No matter how poor I am. No matter though the prosperous of my time will not enter my obscure dwelling. If the sacred writers will enter and take up their abode under my roof, if Milton will cross my threshold to sing to me of paradise, and Shakspeare to open to me the worlds of imagination and the workings of the human heart, and Franklin to enrich me with his practical wisdom, I shall not pine for want of intellectual companionship, and I may become a cultivated man, though excluded from what is called the best society in the place where I live.

ON LABOR.—Manual labor is a great good, but only in its just proportions. In excess it does great harm. It is not a good when made the sole work of life. It must be joined with higher means of improvement or it degrades instead of exalting. Man has a various nature which requires a variety of occupation and discipline for its growth. Study, meditation, society, and relaxation should be mixed up with his physical toil. He has intellect, heart, imagination, taste, as well as bones and muscles; and he is grievously wronged when compelled to exclusive drudgery for bodily subsistence.

ON POLITICS.—To govern one's self (not others) is true glory. To serve through love, not to rule, is Christian greatness. Office is not dignity. The lowest men, because most faithless in principle, most servile to opinion, are to be found in office. I am sorry to say it, but the truth should be spoken, that, at the present moment, political action in this country does little to lift up any who are concerned in it. It stands in opposition to a high morality. Politics, indeed, regarded as the study and pursuit of the true, enduring good of a community, as the application of great unchangeable principles to public affairs, is a

noble sphere of thought and action, but politics, in its common sense, or considered as the invention of temporary shifts, as the playing of a subtle game, as the tactics of party for gaining power and the spoils of office, and for elevating one set of men above another is a paltry and debasing concern.

ON SELF-DENIAL.—To deny ourselves is to deny, to withstand, to renounce whatever, within or without, interferes with our conviction of right, or with the will of God. It is to suffer, to make sacrifice, for duty or our principles. The question now offers itself: What constitutes the singular merit of this suffering? Mere suffering, we all know, is not virtue. Evil men often endure pain as well as the good and are evil still. This, and this alone, constitutes the worth and importance of the sacrifice, suffering, which enters into self-denial, that it springs from and manifests moral strength, power over ourselves, force of purpose, or the mind's resolute determination of itself to duty. It is the proof and result of inward energy. Difficulty, hardship, suffering, sacrifices, are tests and measures of moral force and the great means of its enlargement. To withstand these is the same thing as to put forth power. Self-denial then is the will acting with power in the choice and prosecution of duty. Here we have the distinguishing glory of self-denial, and here we have the essence and distinction of a good and virtuous man.

ON PLEASURE.—The first means of placing a people beyond the temptations to intemperance is to furnish them with the means of innocent pleasure. By innocent pleasures I mean such as excite moderately; such as produce a cheerful frame of mind, not boisterous mirth; such as refresh, instead of exhausting, the system; such as are chastened by self-respect, and are accompanied with the consciousness that life has a higher end than to be amused. In every community there *must* be pleasures, relaxations and means of agreeable excitement; and if innocent ones are not furnished, resort will be had to criminal. Men drink to excess very often to shake off depression, or to satisfy the restless thirst for agreeable excitement, and these motives are excluded in a cheerful community. A gloomy state of society in which there are few innocent recreations, may be expected to abound in drunkenness if opportunities are afforded. The savage drinks to excess because his hours of sobriety are dull and unvaried, because in losing consciousness of his condition and his existence he loses little which he wishes to retain. The laboring classes are most exposed to intemperance, because they have at present few other pleasurable excitements. A man, who, after toil, has resources of blameless recreation is less tempted than other men to seek self-oblivion. He has too many of the pleasures of the man to take up those of the brute.

[End of Required Reading for November.]

AUTUMN SYMPATHY.

By E. G. CHARLESWORTH.

The primrose and the violet,
The bloom on apricot and peach,
The marriage-song of larks in heights,
The south wind and the swallow's nest;
All born of spring, I once loved best.

But now the dying leaf and flower,
The frost wind moaning in the pane,
The robin's plaintive latter song,
The early sunset in the west;
All born of autumn, I love best.

Tell me, my heart, the reason why
Thy pulse thus beats with things that die;
Is it thine own autumnal sheaves?
Is it thine own dead fallen leaves?

—London Sunday Magazine.

REPUBLICAN PROSPECTS IN FRANCE.

By JOSEPH REINACH.

On the very morrow of Gambetta's death, and when that catastrophe had been interpreted by the immense majority of European opinion, as also by many Frenchmen, as the certain presage of the approaching triumph of advanced Radicalism—triumph to be followed by violent interior discords that would infallibly bring about the fall of the Republic and the re-establishment either of Empire or of Royalty—I said that these predictions would not be realized, and, moreover, that Gambetta's death would but serve to hasten the triumph of his political ideas and party. I will cite, word for word, what I wrote at the end of January in a paper that appeared in this Review on February 1:

"We even believe we may predict that the realization of several of Gambetta's ideas will meet with fewer obstacles, at least among a certain fraction of public opinion, to-morrow than yesterday. A formidable reaction will take place in favor of the great statesman whom we weep, a reaction in favor of his theories and his principles. In short, we shall most likely witness the contrary of what has taken place for some years. It was enough that Gambetta should defend a theory for it to be attacked with fury. From henceforth it will often suffice that an idea was formerly held up by Gambetta for it to be enthusiastically acclaimed. As in the story of Cid Campeador, it is his corpse that leads his followers to victory."

What I foretold six months ago has been fulfilled in every point. Those very Castilians who during Cid's lifetime suspected him of the darkest designs and reviled him as a criminal—what did they do after his death? They put the hero's corpse in an iron coffin, and the black gravecloth on the bier was the standard which, in the front rank of battle, led the Spanish army to victory. And so has it been, or nearly so, with French Republicans and Gambetta. The political history of our country during the last six months may be thus summed up: Out of Gambetta's death-bed has arisen a first (not complete) victory for his ideas and friends; from the party more specially organized by him have been chosen most men now in office, that they may execute his will.

As a matter of fact, just after the excitement of the first few days, as soon as it became necessary for the Republicans to unite and stop the Royalists who thought the fruit already ripe, what ministers did the President of the Republic call for? M. Jules Ferry, who for the last five years had been, if not the direct coadjutor, at least the most invariable and faithful political ally of Gambetta, was made Prime Minister; M. Waldeck-Rousseau, the late Minister for Home Affairs under Gambetta, and M. Raynal, the late Minister of Public Works, were both recalled to the same offices. M. Challemel-Lacour, Gambetta's most esteemed and devoted friend, was named Minister of Foreign Affairs, and M. Martin Feuillée, Under-Secretary of State for Justice on November 14, Minister of Justice; M. Margue, Under-Secretary of State for Home Affairs, resumed the same post. General Camponon could have been Minister of War had he wished it. And a great pity it is he declined his friends' proposals. Thus, in its general bearings, the Ferry Ministry is the Gambetta Ministry without Gambetta.

Except some secondary modifications made necessary by the change of circumstances, the political program is about the same. Abroad an active and steady diplomacy, the regular development of our colonial politics, the consolidation of the protectorate in Tunis; at home the constitution of a strong government, the methodical realization of social and democratic reforms, the policy of *scrutin de liste*, whilst awaiting the abolition of *scrutin d'arrondissement*. The principal bills adopted last session, except the Magistracy bill, are but legacies from the Gambetta Cabinet. Both cabinets are animated by the

same national spirit—national above all, but also progressist and governmental. The halo imparted by the presence of a man of genius is certainly wanting; but Carlyle's *hero-worship* is by no means a democratic necessity. There is certainly reason for rejoicing when a nation acknowledges and appreciates in one of its sons, sprung from its midst, an intellect of the highest order. But when Alexander leaves lieutenants profoundly imbued with his spirit, formed in his school, most desirous and capable of continuing his work—when these men, instead of being at variance, remain, on the contrary, more strongly bound together than ever—there is certainly no reason for complaining and giving way to discouragement.

Then it is not only in parliament that the *opportunist* policy is again getting the upper hand. Throughout the whole country it has regained the ground it had lost by the intrigues of hostile parties. The great majority of Republicans have now recovered from a number of diseases for which Gambetta had always prescribed the remedy—remedy, alas! that too many refused to stretch out their hand for. The mania for decentralization is forgotten. The necessity for a strongly constituted and vigorous central power is almost universally understood and acknowledged. Demagogue charlatans are for the most part unmasked. Our foreign policy is steadier—we are no longer afraid of Egyptian shadows. Intransigents of the Right and Left still continue to see in our colonial enterprises but vulgar jobbing, and to denounce and revile them in every possible way. But the great mass of the nation is no longer to be made a fool of, and has understood the necessity of extending France beyond the seas. There is a story of an English peasant who locked the stable door after the horse had been stolen. Happily for France she has several horses in her stables. If she has lost, at least for a time, her beautiful Arabian steed on the borders of the Nile, that is but an additional reason for taking jealous care of the others.—*The Nineteenth Century*.

IN 404 Honorius was emperor. At that time, in the remote deserts of Lybia, there dwelt an obscure monk named Telemachus. He had heard of the awful scenes in the far-off Coliseum at Rome. Depend upon it, they lost nothing by their transit across the Mediterranean in the hands of Greek and Roman sailors. In the baths and market-places of Alexandria, in the Jewries of Cyrene, in the mouths of every itinerant Eastern story-teller, the festive massacres of the Coliseum would doubtless be clothed in colors truly appalling, yet scarcely more appalling than the truth.

Telemachus brooded over these horrors till his mission dawned upon him. He was ordained by heaven to put an end to the slaughter of human beings in the Coliseum. He made his way to Rome. He entered the Coliseum with the throng, what time the gladiators were parading in front of the emperor with uplifted swords and the wild mockery of homage—"Morituri te salutant." Elbowing his way to the barrier, he leapt over at the moment when the combatants rushed at each other, threw himself between them, bidding them, in the name of Christ, to desist. To blank astonishment succeeded imperial contempt and popular fury. Telemachus fell slain by the swords of the gladiators. Legend may adorn the tale and fancy fill out the picture, but the solid fact remains—*there never was another gladiatorial fight in the Coliseum*. One heroic soul had caught the flow of public feeling that had already begun to set in the direction of humanity, and turned it. He had embodied by his act and consecrated by his death the sentiment that already lay timidly in the hearts of thousands in that great city of Rome. In 430 an edict was passed abolishing forever gladiatorial exhibitions.—*Good Words*.

ALL merit ceases the moment we perform an act for the sake of its consequences. Truly in this respect "we have our reward."—*Wilhelm von Humboldt*.

CHAUTAUQUA TO CALIFORNIA.

By FRANCES E. WILLARD, President N. W. C. T. U.

I.

I.—SOUTHERN CALIFORNIA.

In one thing Chautauqua and California are alike—each is a climax, and both are "made up of every creature's best." My sufficient consolation for missing one of them this year is, that I saw the other. Let us speed onward, then, taking Chautauqua as our point of departure, in a Pickwickian sense only, unless for the further reason that it has the high prerogative of making all its happy denizens believe it to be the center of gravity (and good times) for one planet at least; the meridian from which all fortunate longitude is reckoned and all lucky time-pieces set. Our swift train, "outward bound," races along through the old familiar East and the West no longer new.

"Through the kingdoms of corn,
Through the empires of grain,
Through dominions of forest;
Drives the thundering train;
Through fields where God's cattle
Are turned out to grass,
And his poultry whirl up
From the wheels as we pass;
Through level horizons as still as the moon
With the wilds fast asleep and the winds in a swoon."

From a palace car with every eastern luxury, we gaze out on the dappled, pea-green hills of New Mexico and the wide, empty stretches of Arizona, stopping in Santa Fe—Columbia's Damascus, in Albuquerque—a pocket edition of Chicago, and in Tucson—the storm-center of semi-tropic trade. But the "W. C. T. U." is a plant of healing as indigenous to every soil for good as the saloon for evil, and in the first city the Governor's wife has accepted leadership; in the second that place is held by a lovely Ohio girl, the wife of a young lawyer; and in the third a leading woman of society and church work, whose husband is one of Arizona's most honored pioneers, consents to be our standard-bearer. These way-side errands, with their delightful new friendships and tender gospel lessons over, we hasten on to California. Some token of its affluent beauty comes to us on Easter Sabbath in the one hundred calla-lilies sent from Los Angeles, five hundred miles beyond, to adorn the church where we worship in Tucson, that marvelous oasis in the desert. "Go on, and God be with you," says the friend who escorts us to the train; "you'll find Los Angeles a heaven on earth." And so, indeed, we did, coming up out of the wilderness on a soft spring day, between fair, emerald hills that stood as the fore-runners of the choicest land on which were ever mirrored the glory and the loveliness of God.

We visited the thirty leading centers of interest and activity in the great Golden State during the two months of our stay, but when the courteous mayor of this "city of the angels" welcomed us thither, and children heaped about us their baskets of flowers, rare, save in California, we told "His Honor" that of all the towns we had yet visited—and they number a thousand at least—his was the one most fitly named.

Southern California, and this its exquisite metropolis, have been a terra incognita even to the intelligent, until the steam horse lately caracoled this way. Now it is thronged by emigrants and tourists, men and women of small means reaping from half a dozen acres here what a large farm in Illinois could hardly yield, and invalids hitherto only an expense to their friends, finding the elixir of life in this balmy air, and joyously joining once more the energetic working forces of the world. Flowers are so plenty here that banks and pyramids alone can satisfy the claims of decorative art; baskets of roses are more frequent than bouquets, or even *boutonnieres* with us. Heliotropes and fuchsias climb to the apex of the roof, while the

common garden trees are oranges, lemons, limes, citrons, figs, olives and pomegranates. Strawberry short-cake can be had all the year round from the fresh fruit of one's own garden, and oranges at the rate of nine thousand to one tree, and in some cases fifteen inches in circumference, have been raised in this vicinity. Riverside and Pasadena are adjacent colonies and bear a stronger resemblance to one's ideal Garden of Eden than any other places I ever expect to see. Through groves of rarest semi-tropic fruit trees you ride for miles, in the midst of beautiful, modern homes, for the American renaissance is not more manifest in the suburbs of Boston or Chicago than in Southern California. Fences are nowhere visible, the Monterey cypress furnishing a hedge which puts to blush the choicest of old England; the pepper tree with drooping branches, and the Australian gum tree, tall and umbrageous, outlining level avenues whose vistas seem unending. Above all this are skies that give back one's best Italian memories, and for a background the tranquil amplitude of the Sierra Madre Mountains. What would you more? "See Naples and die" is an outworn phrase. "See California and live" has been the magic formula of how many restored and happy pilgrims! The tonic of cold water has electrified this soil, seven years ago an utter desert, so that now three years of growth will work a transformation that fifteen would fail to bring about east of the Mississippi. To my thinking this result is but a material prototype of the heavenly estate that shall come to our America when its arid waste of brains and stomachs, usurped by alcohol, shall learn the cooling virtues of this same cold water. In Riverside my host planted in May of 1880, two thousand grape cuttings (not roots, remember), and in September, 1881, gathered from them two hundred boxes of grapes. Pasadena was founded by a good man from Maine, and is exempt from saloons by the provisions of its charter. Here, from six acres, a gentleman realized thirteen hundred dollars, clear of all expenses, last year, by drying and sacking his grapes, instead of sending them to the winery. "The profits were so much larger that hereafter his pocket-book will counsel him, if not his conscience, to keep clear of the wine trade," said the wide awake temperance woman who gave me the item. In Pasadena, Mrs. Jennie C. Carr, whose fruit ranche and gardens, largely tilled by her own hands, disclose every imaginable variety which the most extravagant climate can produce, sells at three thousand dollars per acre, land purchased by her for a mere song six years ago. In Santa Ana and San Bernardino, also near Los Angeles, there is the same luxuriance and swift moving life. A county superintendent of schools told me he had one school district that includes 160 miles of railroad, and has a town of 800 people, where three months ago there was silence and vacancy. At San Diego, the most southerly town in California, we found the *ne plus ultra* of climate for consumptives, its temperature ranging from fifty-five to seventy-five degrees, and its air dry. San Diego is the oldest town in the State, having been established as a Catholic "Mission" in 1769. It is now altogether modernized and is Nature's own sanitarium, besides being a lovely land-locked harbor of the Pacific. Santa Barbara, which we missed seeing, has a grape vine sixty years old, and a foot through, which in 1867 bore six tons of grapes, some of whose clusters weighed five pounds each. The railroad will soon make this beautiful town accessible to rapid tourists to whom the ocean is unkind. Twenty-one missions were founded over a century ago by Franciscan friars in Southern California. They brought with them from Spain the orange and the vine. They were conquerors, civilizers, subduers of the soil. They brought cattle, horses, sheep, and—alas! hogs. They conquered the land for Spain without cruelty, baptizing the Indians into the church and teaching them the arts of peace. Then followed the Mexican, then our own conquest of their territory, and now the Anglo-Saxon reigns supreme in a land on which Nature has lavished all she had to give. Upon his victory over the alcohol habit, depends the future

of this goodly heritage. If he raises grapes he will survive; if he turns them into wine he must succumb.

II.—SAN JOAQUIN VALLEY.

We crossed the famous and dangerous "Tehachapi Pass" at night, and wended our way slowly through this notable valley, three hundred miles in length by thirty-five in width, stopping to found the W. C. T. U. in its four chief towns, Fresno, Tulare, Merced, and Modesto.

Irrigation is the watchword here, and as it takes capitalists to carry this through on a scale so immense, large farms are now the rule. For instance, we passed over one seventy-three miles in length by twenty in width. Later on, it is to be hoped these immense proprietaries may be settled by men whose primary object is to establish and maintain homes. At present, in the agricultural line, "big enterprises" are alone attractive. "Alfalfa," a peculiarly hardy and luxuriant clover—imported by Governor Bigler from Chili—is the first crop, and grazing precedes grain. This plant "strikes its roots six feet or more into the soil, and never requires a second planting, while every year there are five crops of alfalfa and but two of wheat and barley."

Varied indeed is the population of this valley. One day we dine with a practical woman from Massachusetts, who declares that the sand storms, which most people consider the heaviest discount on the valley, are "really not so bad, for they polish off the house floors as nothing else could." The next we meet a group of earnest, motherly hearts from a dozen different States, and almost as many religious denominations, united to "provide for the common defense" of home against saloon. Next day a lawyer from Charleston invites us to his cozy residence, "because his wife knows some of our Southern leaders in the W. C. T. U." The next we make acquaintance with half a dozen school ma'ams from the East, who have taken a ranche and set up housekeeping for themselves; and in the fourth town visited an Englishman born in Auckland, New Zealand, the leading criminal lawyer of the county, and instigator of the woman's crusade in Oakland, who gives us a graphic description of that movement, which was a far-off echo of the Ohio pentecost.

So we move on at the rate of two meetings a day, with the hearty support of the united clergy (except the Episcopal, and often they helped us, too), and the warm coöperation of the temperance societies, emerging in San Francisco, Monday, April 16, 1883.

III.—SAN FRANCISCO.

I am glad we did not so far forget ourselves as to arrive on Sunday, for it appears that certain good, gifted, and famous persons, who shall be nameless, telegraphed to certain Christian leaders of their intended arrival on that day, and received answer: "The hour of your coming will find us at church. The Palace is the best hotel." Now on an overland trip, an absent-minded traveler might fail to note the precise date of his arrival in the metropolis of the Pacific, but that would be no excuse to our guid folk yonder, whose Sunday laws have been smitten from their statute books, and Christians hold themselves to strict account for their example, which now alone conserves the Christian's worship and the poor man's rest.

San Francisco is probably the most cosmopolitan city now extant. Its three hundred thousand people sound the gamut of nationality in the most varying and dissonant chorus that ever greeted human ears. The struggle for survival is an astonishing mixture of fierceness and good-nature. Crowding along the streets, Irish and Chinaman, New Englander and Negro, show kind consideration, but in the marts of trade and at the polls "their guns are ballots, their bullets are ideas." Old-time asperities are softening, however, even on these battle-grounds. The trend is upward, toward higher levels of hope and brotherhood. Eliminate the alcohol and opium habits, and all these would (and will ere long) dwell together in unity. Lives like those of Rev. Dr. Otis Gibson, and Mrs. Captain Goodall, invested for the Christianizing of the Chinese, or like that of Mrs.

Sarah B. Cooper, devoted to kindergartening the embryo "hoodlum," or that of Dr. R. H. McDonald, the millionaire philanthropist, consecrated to the temperance reform, are mighty prophecies of the good time coming.

San Francisco is the city of bay windows, and its people, beyond any other on this continent, believe in sunshine and fresh air. In like manner, they are fond of ventilating every subject, are in nowise afraid of the next thing simply because it is the next, but have broad hospitality for new ideas. Rapid as the heel taps of its street life is the movement of its thought and the flame of its sympathy. Much as has been said in its dispraise, Mount Diablo—the chief feature of its environs—is not so symbolic of its spirit as the white tomb of Thomas Starr King, which, standing beside one of its busiest streets, is a perpetual reminder of noble power conserved for noblest use. Everybody knows San Francisco's harbor is without a rival save Puget Sound and Constantinople. Everybody has heard of its "Palace Hotel," the largest in the world, and one that includes "eighteen acres of floor;" of its "endless chain" street cars, the inevitable outgrowth of dire necessity in its up-hill streets; of its indescribable "Chinatown;" of "Seal Rock," with its monster sea-lions, gamboling and howling year out and year in, for herein are the salient features of the strange city's individuality. For a metropolis but thirty-four years old, the following record is unrivaled: Total value of real and personal property, \$253,000,000; school property, \$1,000,000; 130,000 buildings; 11,000 streets; 12 street car lines; 33 libraries and reading-rooms; 38 hospitals; 316 benevolent societies; 168 newspapers, and—the best fire department in the world!

The two drawbacks of this wonderful city are its variable climate and its possible earthquakes. A witty writer warns the intending tourist thus: "Be sure to bring your *summer* clothes. Let me repeat: be sure to bring your *winter* clothes." To state the fact that in August one may see fur cloaks any day, and in January a June toilet is not uncommon, is but another way of stating that the galloping sea breeze, unimpeded by mountains, rushes in moist squadrons on the shore, and has all seasons for its own, in which to battle with the genial warmth of this most lovely climate. As to earthquakes, there have been but three since 1849, and these were insignificant calamities compared with one year of our domesticated western tornadoes. Less than fifty lives have been lost in California by earthquakes, thirty-seven of these occurring in the country outside of San Francisco, and less than a hundred thousand dollars worth of property has been destroyed, while two millions would not cover our loss by cyclone in a single year, to say nothing of the number of victims. Civilization seems to have a naturalizing effect on fleas, snakes and earthquakes, west of the Sierras, but acts as a tonic upon hurricanes east of the Rockies. Will our scientists please "rise to explain" this mystery so close in its relation to human weal and woe?

[To be continued.]

TO MY BOOKS.

By LADY STIRLING-MAXWELL.

Silent companions of the lonely hour,
Friends, who can never alter or forsake,
Who for inconstant roving have no power,
And all neglect, perforce, must calmly take,
Let me return to you; this turmoil ending
Which worldly cares have in my spirit wrought,
And, o'er your old familiar pages bending,
Refresh my mind with many a tranquil thought:
Till, haply meeting there, from time to time,
Fancies, the audible echo of my own,
'Twill be like hearing in a foreign clime
My native language spoke in friendly tone,
And with a sort of welcome I shall dwell
On these, my unripe musings, told so well.

EARTHQUAKES—ISCHIA AND JAVA.

PHENOMENA AND PROBABLE CAUSES.

These violent convulsions that from time to time shake and rend the earth, are among the most terrible calamities that come upon men, causing immense destruction of property and of life. Their occurrence is often most unexpected.

Villages, cities, and whole districts of densely populated countries sink beneath a sudden stroke, overwhelmed in a common ruin. If any warning is given, the alarming premonitions rather confuse and paralyze effort, because, with the appalling certainty of disaster, there is nothing to show in what form it will come, or to indicate a place of refuge.

While the recent horrors at Ischia and in Java excite much painful interest in the public mind, they naturally recall similar scenes of other years. Earthquakes of less destructive violence are very frequent, and suggest greater power than is exerted. Even the slight trembling, or vibratory motions, that produce no material injury, remind us of the prodigious forces that may at any moment burst their barriers with great violence.

In every perceptible shock we feel the mighty pulsations of the agitated molten mass whose waves dash against the walls that restrain them; or the struggling of compressed elastic gases, that must have vent, though their escape rend the earth. The crust between us and the seas of fire, whose extent no man knoweth, may be in places weakening, cut away, as the inner walls of a furnace by the molten metal; so the danger may be nearer and greater than is known or feared. A devout man finds refuge and a comfortable assurance in the truth, "The Lord reigneth; in his hands are the deep places of the earth. The strength of the hills is his also."

There are records of earthquakes more ancient than any books written by men. They antedate the earliest chapters of human history, and probably belonged to the pre-adamite earth. If no human ear heard their tread, the footprints are still visible. In all mountainous regions the evidence of their upheaval by some mighty force is too plain to be doubted. The marine fossils found far up on their heights, the position of strata, often far from horizontal, with immense fissures, and chasms of unknown depth, all tell of disturbances that may have taken place before the historic period. If in those primitive times mountains were literally carried into the midst of the sea, and vast tracts of the ocean's bed shoved up thousands of feet, it was only a more terrible display of the gigantic powers still in action, and of whose workings the centuries have borne witness.

No country seems to have escaped these terrible visitations, though some suffer more than others. Volcanoes being of the same origin, they are more frequent in volcanic regions, and perhaps by their shocks the seething caldrons have been uncovered.

The same localities, as Southern Italy, and the neighboring island of Sicily, have, from a remote period, at times been terribly shaken. From 1783 to 1786 a thousand shocks were made note of, five hundred of which are described as having much force. Lyell considers them of special importance, not because differing from like disturbances in other places, but because observed and minutely described by men competent to collect and state such physical facts in a way to show their bearing on the science of the earth. The following, collected from Lyell, Gibbon, Humboldt, and the encyclopædias, are facts respecting some of the principal earthquakes on record. Their statements, much condensed, are not given in chronological order, but as we find them:

In 115, of the Christian era, Antioch in Syria, "Queen of the East," beautiful in itself, and beautiful for situation, a city of two hundred thousand inhabitants, was utterly ruined by earthquake. Afterward rebuilt, in more than all its ancient splendor, by Trajan, the tide of life and wealth again flowed into it, and for centuries we read of no serious disasters of the kind. All apprehension of danger removed, the people became famous for

luxurious refinements, and, strangely enough, seem to have united high intellectual qualities with a passionate fondness for amusements. In 458 the city was again terribly shaken, and twice in the sixth century. Each time the destruction was nearly complete; but each time, in less than a century, the city was restored again, but only to stand until 1822, and from that overthrow it has never recovered, being now a miserable town of only six thousand inhabitants. The destruction of five populous cities, on one site, involved a fearful loss of life. Probably more than half a million thus perished. The most destructive earthquake in that, or any other locality, of which we find any mention, was in 562. An immense number of strangers being in attendance at the festival of the Ascension, added to the multitudes belonging to the city. Gibbon estimates that two hundred and fifty thousand persons were buried in the ruins.

Among the earliest accounts of earthquakes having particular interest, is the familiar one of that which destroyed Herculaneum and Pompeii in the year 63—about sixteen years before those cities were buried in scoria and ashes from Vesuvius.

Of modern earthquakes three or four are here mentioned as presenting some interesting phenomena. That of Chili, in 1822, caused the permanent elevation of the country between the Andes and the coast. The area thus raised is estimated at one hundred thousand square miles, and the elevation from two to seven feet. Shore lines, at higher levels, indicate several previous upheavals of the same region, along about the same lines. The opposite of this, a depression of land, was occasioned in the island of Jamaica in 1692, when Port Royal, the capital, was overwhelmed. A thousand acres or more thus sank in less than one minute, the sea rolling in and driving the vessels that were in the harbor over the tops of the houses.

The earthquake of New Madrid, below St. Louis, on the Mississippi, was in 1811, and interesting as an instance of successive shocks, and almost incessant quaking of the ground for months, and at a distance from any volcano. The agitation of the earth in Missouri continued till near the time of the destruction of the city of Caracas, in South America, and then ceased. One evening, about this time, is described by the inhabitants of New Madrid as cloudless, and peculiarly brilliant. The western sky was a continual glare from vivid flashes of lightning, and peals of thunder were incessantly heard, apparently proceeding, as did the flashes, from below the horizon. Comparatively little harm was done in Missouri, but the beautiful city of Caracas, with its splendid churches and palatial homes, was made a heap of ruins, beneath which twelve thousand of its inhabitants were buried. Just how these events were related we know not. Whether the same pent-up forces that were struggling in vain to escape in the valley of the Mississippi, found vent in that distant locality, God only knows. The supposition allowed may account for the relief that came to the greatly troubled New Madrid. The evils they dreaded came but in part—enough only to suggest the greater perils they escaped. Over an extent of country three hundred miles in length fissures were opened in the ground through which mud and water were thrown, high as the tops of the trees. From the mouth of the Ohio to the St. Francis the ground rose and fell in great undulations. Lakes were formed and drained again, and the general surface so lowered that the country along the White River and its tributaries, for a distance of seventy miles, is known as "the sunk country." Flint, the geographer, seven years after the event, noticed hundreds of chasms then closed and partially filled. They may yet, in places, be traced, having the appearance of artificial trenches.

Fissures are occasionally met in different parts of the country, which extend through solid rock to a great depth. "The Rocks" at Panama, N. Y., have been elsewhere described, and furnish a profitable study.

A more remarkable chasm of this kind extends from the western base of the Shawangunk Mountain, near Ellenville, Ulster County, N. Y., for about a mile to the summit. At first

one can easily step across the fissure, but further up it becomes wider, till the hard vertical walls of sandstone are separated by a gorge several feet wide, and of great depth. At the top an area of a hundred acres or more is rent in every direction, the continuity of the surface being interrupted by steps of rocks, presenting abrupt walls. The gorge traced up the mountain becomes a frightful abyss, more than a hundred feet wide. Among the loose stones at the bottom large trees are growing, whose tops scarce reach half way to the edge of the precipice. Most such disruptions of rocks and mountains were doubtless caused by earthquakes at some unknown period.

The great earthquake at Lisbon, the capital of Portugal, was in 1755. "The ominous rumbling sound below the surface was almost immediately followed by the shock which threw down the principal part of the city; in the short space of six minutes, it is believed, 60,000 perished. The sea rolled back, leaving the bar dry, and then returned, in a great tidal wave, fifty feet, or more, in height. The mountains around were shaken with great violence, their rocks rent, and thrown in fragments into the valley below. Multitudes of people rushed from their falling buildings to the marble quay, which suddenly sank with them, like a ship foundering at sea; and when the waters closed over the place no fragments of the wreck—none of the vessels near by, that were drawn into the whirlpool, and not one of the thousands of the bodies that were carried down ever appeared again. Over the spot occupied by the quay, the water stood six hundred feet deep; and beneath it, locked in fissured rocks, and in chasms of unknown depth, lie what was the life and wealth of the place, in the middle of the eighteenth century."

Earthquakes, of especial interest, from their recent occurrence and destructive effects, are those of 1857-58, in the kingdom of Naples, and in Mexico; but we have not room to more than mention them. The past summer will be remembered as the period of at least two terrible disasters from earthquakes, in localities distant from each other. The first, July 28, was at Ischia, a beautiful island at the north entrance of the bay of Naples. The principal town, Cassamicciola, was mostly destroyed, and much injury done at other places. The town was a noted health resort, and it is feared many distinguished strangers perished in it. The shocks began in the night, when a majority of the citizens, who frequent such places, were in the theater, and the scene there was terrible. Lamps were overturned; clouds of dust arose, and then the walls of the building opened, and fell, giving no opportunity for escape. The ground opened in many places, and houses and their inhabitants were swallowed up. The hotel Piccola Sentinella sank into the earth, with all its inmates. The number destroyed, first estimated at three thousand, was much larger, but how much is not yet certainly known. Years must elapse before the town is restored, when it will be with a new class of inhabitants.

The sad tidings of disaster in Italy were soon followed by still more startling intelligence from Java, where, as in regions bordering on the Mediterranean, earthquakes are not a new experience with the inhabitants. A recital of the calamities occurring in Java during the last century would make a gloomy chapter in history, suggesting the insecurity and transitory nature of all earthly possessions. The island is one of the largest and, commercially, most important, in the Indian archipelago, six hundred and sixty miles in length, and the width varying from forty to one hundred and thirty miles. It is densely populated, and governed by a Dutch viceroy. In the mountain range extending through the center, with a mean elevation of seven thousand feet, are many volcanoes; and earthquakes are of frequent occurrence, as in other volcanic regions. In 1878 record was made of some sixteen, in different parts of the island. One of the most famous, accompanied by a vast eruption of Papandayang, the largest of the volcanoes, took place a hundred years ago, overwhelming an area of a hundred

square miles, and destroying three thousand people—the island at that time having fewer inhabitants. There were two similar eruptions from volcanoes at the same time, respectively one hundred and thirty-four and three hundred and fifty-two miles from Papandayang, suggesting the fact that the power of producing them, and the earthquakes, may operate through a field of vast extent, and breaks through where the barriers give way. It is safe to say both have the same origin.

Ischia and Java, though almost antipodes, are companions in disaster, and possibly felt the dashing of the same billows, striking with violence here or there, according as some mighty impulse drove them on. The great calamities of the past summer, besides their appeal to our humanity, will be of interest to scientific men, and may throw light on the relations of earthquakes and volcanoes, and their cause, after which they have been searching a good deal in the dark, and with results not yet satisfactory.

The accounts of the last fearful disaster are yet incomplete, and may not all be verified. The latest, and apparently most reliable reports, place it among the most terrible calamities known in the history of the race, since the deluge. The earth trembled and shook—rocks were rent—buildings tumbled in ruins. A large part of the city, full of wealth and life, sank out of sight. Tidal waves carried destruction along the coast. Volcanoes belched forth smoke, ashes and lava, overspreading fertile valleys; and when the sulphurous clouds that hung over them, black as night, were lifted, turbulent waters rolled over fifty square miles of pasture lands that the day before were covered with flocks, and the homes of men. It is estimated that seventy-five thousand people perished. It may be a few thousand less, or more, as there are yet no data from which to form more than a proximate estimate. The whole number will not be known till the graves and the sea give up their dead.

LOW SPIRITS.

By J. MORTIMER GRANVILLE.

There is enough in the daily experience of life to depress the feelings and rob the mind of its buoyancy, without having to encounter lowness of spirits as a besetting mental state or malady. Nevertheless, it so frequently assumes the character of an affection essentially morbid, attacks individuals who are not naturally disposed to despondency, and gives so many unmistakable proofs of its close relations with the health of the physical organism, that it must needs be included in the category of disease. The constitutional melancholy which distinguishes certain types of character and development, is a setting in the minor key rather than depression. Within the compass of a lower range, individuals of this class exhibit as many changes of mood as those whose temperament is, so to say, pitched higher, and who therefore seem to be capable of greater elation.

It is important to ascertain at the outset whether a particular person upon whom interest may be centered is not naturally characterized by this restrained or reserved tone of feeling! Unhealthy conditions of mind are generally to be recognized by the circumstance that they offer a contrast to some previous state. The movable, excitable temperament may become fixed and seemingly unimpressionable, the self-possessed begin to be irritable, the calm, passionate. It is the *change* that attracts attention, and when low spirits come to afflict a mind wont to exhibit resilience and joyousness, there must be a cause for the altered tone, and prudence will enjoin watchfulness. Mischievous may be done unwittingly by trying to stimulate the uncontrollable emotions.

There are few more common errors than that which assumes

lowness of spirits to be a state in which an appeal should be made to the sufferer. We constantly find intelligent and experienced persons, who show considerable skill in dealing with other mental disorders and disturbances, fail in the attempt to relieve the pains of melancholy. They strive by entreaty, expostulation, firmness, and even brusqueness, to coerce the victim, and prevail upon him to shake off his despondency. They urge him to take an interest in what is passing around, to bestir himself, and put an end to his broodings. This would be all very well if the burden that presses so heavily on the spirit simply lay on the surface, but the lowness of which I am speaking is something far deeper than can be reached by "rallying." It is a freezing of all the energies; a blight which destroys the vitality, a poison which enervates and paralyzes the whole system.

It is no use probing the consciousness for the cause while the depression lasts—as well look for the weapon by which a man has been struck senseless to the earth, when the victim lies faint and bleeding in need of instant succor. If the cause were found at such a moment, nothing could be done to prevent its further mischief. Supposing it to be discovered that the malady is the fruit of some evil-doing or wrong management of self, the moment when a crushed spirit is undergoing the penalty of its error is not that which should be selected for remonstrance. It is vain to argue with a man whose every faculty of self-control is at its lowest ebb. The judgment and the will are dormant. The show of feeling made by the conscience in the hour of dejection is in great part emotional, and the purposes then formed are sterile. The tears of regret, the efforts of resolve, elicited in the state of depression, are worse than useless; they are like the struggles of a man sinking in the quicksand—they bury the mind deeper instead of freeing it.

The state of mental collapse must be allowed to pass; but here comes the difficulty; the moment reaction takes place, as shown by a slight raising of the cloud, it will be too late to interfere. The mind will then have entered on another phase not less morbid than the depression which it has replaced. There is no certain indication of the right moment to make the effort for the relief of a sufferer from this progressive malady. The way to help is to watch the changes of temperament narrowly, and, guided by time rather than symptoms, to present some new object of interest—a trip, an enterprise, a congenial task—at the moment which immediately precedes the recovery. The soul lies brooding—it is about to wake; the precise time can be foreknown only by watching the course of previous attacks; whatever engrosses the rousing faculties most powerfully on waking, will probably hold them for awhile. It is a struggle between good and healthy influences on the one hand, and evil and morbid on the other. If it be earnestly desired to rescue the sufferer, the right method must be pursued, and wrong and mischief-working procedures—among which preaching, persuading, moralizing, and rallying are the worst and most hurtful—ought to be carefully avoided. When the thoughts are revived and the faculties rebound, they must be kept engaged with cheering and healthful subjects.

There is no greater error than to suppose good has been accomplished when a melancholic patient has been simply aroused. The apparently bright interval of a malady of this class is even more perilous than the period of exhaustion and lowness. The moment the mind resumes the active state, it generally resumes the work of self-destruction. The worst mischief is wrought in the so-called lucid interval. The consciousness must be absorbed and busied with healthful exercise, or it will re-engage in the morbid process which culminates in depression. The problem is to keep off the next collapse, and this can be accomplished only by obviating the unhealthy excitement by which it is commonly preceded and produced. Healthy activity promotes nutrition, and replenishes the strength of mind and body alike; all action that does not improve the quality of the organ acting, deteriorates it and tends to prevent normal function.

VEGETABLE VILLAINS.

By R. TURNER.

THE LARGER FUNGI.

To become acquainted with the bulkier of these villains, we must visit their favorite haunts. An occasional one may occur in any kind of place, as has already been explained. A good many, especially of the edible sort, and notably the common mushroom, grow in open pastures. To get among crowds of them, however, we must resort to close woods, especially of fir and pine. There they grow on tree-stumps, fallen trunks, and on the ground, in great variety and abundance. If we go at the proper season their profusion will astonish us. This time of plenty varies from early to late autumn with the character of the weather. Clad in waterproof wraps and with leather gloves on hand, we may make a fungus foray into the dripping woods amid russet and falling leaves with comparative comfort; and even on a "raw rheumatic day" there will likely be much enjoyment for us and still more instruction. It will be strange, indeed, if we do not find some kinds to eat and very many to think over. We ought to get examples, at least, of nearly all the different families. Let us consider them in a general way as novices do. A host of them have gills like the mushroom; and so we may take that best known of them all as a type of the whole class. Mushroom spawn runs through the soil in a rootlike way, absorbing the organic matter it falls in with and every here and there swelling out into roundish bodies, each consisting of a tubercle enclosed in a wrapper. The tubercle bursts through the wrapper as growth goes on, and soon above ground appears the well-known form of the mushroom, with a stalk supporting a fleshy head by the center, and on the under surface of this head radiating gills, which are at first covered by a veil that finally gives way and leaves only a ring round the stem. These gills are originally flesh-colored, but afterward become brown and mottled with numerous minute purple spores. If we were to investigate further by means of the microscope, we should find that the spores are not contained in any case, and that they are produced in fours on little points at the tips of special cells. Of the other kinds belonging to this order of agarics, some differ from the mushroom in being poisonous and others in being parasitic. There is much variety, also, in the tints of gill and spore, different kinds having these white, pink, rosy, salmon-colored, reddish, or yellowish, or darkish brown, purple or black. Again, in some the stem is not central, but attached more or less laterally to the head; in others there is no stem, and the gills radiate out from the substance on which the agaric grows. The ring round the stalk, too, often varies, or is sometimes wanting. There are many other differences, and it is by these that we are able to distinguish the one kind from the other: but, of course, little more can be done here than merely to indicate this infinite variety. Dr. Badham, in his admirable work on the "Esculent Funguses of England," puts this quaintly, as he does many other facts. "These are stilted upon a high leg, and those have not a leg to stand on; some are shell-shaped, many bell-shaped; and some hang upon their stalks like a lawyer's wig."

These gill-bearers, are, however, but one order in this extensive division of plants. Nature's plastic hand is never weary of shaping fresh forms. It is lavish of variety, and never works in a stinted or makeshift way. In place of gills we find in another order tubes or pores in which the spores are produced. These tubular kinds are sometimes fleshy, as in the edible boletus, or woody, as in the polypores, popularly called sap-balls, which every one who knows anything about woods and their wonders must have seen on old tree-stumps, often growing to a great size. In yet another order, spines, or bristles, or teeth, take the place of gills and tubes. In the puff-balls the spores ripen inside a roundish leatheren case, which afterward bursts and discharges them as a fine dust. Then there

is an extensive class in which the spores are not produced in this offhand way at all, but are carefully enclosed in little cases, or rather, I should say, loaded into microscopic guns, as in the pezizas; and very beautiful objects these are under the microscope.

Poisonous, putrescent, strange in shape, or color, or odor, as many of the larger fungi are, it is little to be wondered at that contempt has been a common human feeling with respect to most of them, and a crush with disdainful heel on occasion the lot of a good many. The popular loathing has run out into language. Under the opprobrious term "toadstool," a whole host of kinds is commonly included. The puff-balls are known in Scotland as "de'il's sneeshin'-mills" (devil's snuff-boxes), an epithet which expresses with a certain imaginative humor, and a dash of superstition, the idea of something so utterly base that it ministers to the gratification of demons, tickling their olfactory organs with satanic satisfaction. Indeed, in this country the mushroom is almost the only favored exception to the popular verdict of loathing. It has gained the hearts of the people through their stomachs, and ketchup has overcome popular prejudice by its fine flavor. But there are many others on which cultured palates dote. Truffles are dear delicacies, which few but rich men taste, for fine aroma and flavor command a high price. The Scotch-bonnets of the fairy rings, besides possessing a certain bouquet of elfin romance, cook into delicacies full of stomachic delight. Then there are chantarells and morels and blewitts, and poor-men's-beef-steaks, over which trained appetites rejoice. A score of dainty little rogues at least there are, and a still greater number of kinds that are nutritive and fairly palatable. In some European countries the edible ones are a really valuable addition to the food of the people—not from being more plentiful than with us, but from being more eagerly gathered and diligently cultivated. One sort or other is used as food by every tribe of men. Not only does the edible mushroom occur in all habitable lands, but in certain foreign parts—as in Australia—there are forms of it very much superior in quality to our English ones. Then, of course, every clime has its own peculiar edible kinds. The native bread of the Australians is an instance in point; it looks somewhat like compressed sago, and is a fairly good article of diet. The staple food of the wild Fuegians for several months each year is supplied by a kind which they gather in great abundance from the living twigs of the evergreen beech. Then there are some not very pleasant, according to our ideas, which can be safely used, and are thus available in times of scarcity, as, for instance, the gelatinous one which the New Zealand natives know as "thunder-dirt," and one somewhat similar that the Chinese are said to utilize. A curious trade has of late years sprung up between New Zealand and China. A brown semi-transparent fungus, resembling the human ear, grows abundantly in the North Island. This the Maoris and others collect, dry, and pack into bags, for export to China, where it is highly prized for its flavor and gelatinous qualities as an ingredient in soup. It is a species nearly related to our Jew's-ear. The value of this fungus exported from New Zealand in 1877 was stated at over £11,000.—*Good Words*.

When we reflect how little we have done
And add to that how little we have seen,
And furthermore how little we have won
Of joy or good, how little known or been,
We long for other life, more full, more keen,
And yearn to change with those
Who well have run.

—Jean Ingelow.

A TALENT for any art is rare; but it is given to nearly every one to cultivate a taste for art; only it must be cultivated with earnestness. The more things thou learnest to know and enjoy, the more complete and full will be for thee the delight of living.—*Plato*.

FROM THE BALTIC TO THE ADRIATIC.

By the author of "German-American Housekeeping," etc.

[Continued.]

Travelers are like conchologists, vying with one another in picking up different shells, and herein lies the unending interest of their records.

In the roundabout route from the Baltic to the Adriatic and Mediterranean, Cassel, the electorate in former years of Hesse-Cassel, afforded a most suggestive visit. To be sure, its history is not altogether pleasant to an American, for the fact that the old elector hired his troops to England to fight us during the Revolutionary war, is not a savory bit of German history. Even Frederick the Great saw the meanness of it, for when he heard they were to take their route to England by Prussian roads, he sent word, "if they did so, he would levy a cattle tax on them." Perhaps some of the money paid by England at that time was laid up in the public treasury and expended afterward upon the extravagant ornamentation of the grounds of the elector's summer residence, "Wilhelmshöhe." The palace is in itself one of the most magnificent in Europe. Above the cascades in front of it is the highest fountain on the continent. One stream, twelve inches in diameter, is thrown to the height of two hundred feet. The colossal Hercules which crowned the summit of this artificial grandeur was thirty feet high, and the cascades are nine hundred feet long. The whole arrangement is said to have kept two thousand men engaged for fourteen years, and to have cost over ten million dollars! Jerome Napoleon occupied this palace of Wilhelmshöhe when he was king of Westphalia.

A walk of three miles under the straight and narrow road shaded by lime trees, leads one back to Cassel, after this visit to Wilhelmshöhe. The town is beautifully situated on either side of the river Fulda, and has a population of thirty-two thousand. The beautiful terrace overlooking the *angarten*, crowned by its new picture gallery, offers as delightful promenades as the celebrated Dresden Terrace. The strains of sweet music coming up from the *angarten* (meadow) while one is looking at the beautiful Rembrandts and Van Dykes in the gallery, give the enchantment which one never fails to find in a German town. Napoleon carried away many of the most valuable pictures from the Cassel gallery—but it is redeemed from the number of horrible Jordaens and Teniers by possessing the "pearl of Rembrandts," a portrait of "Saskia," his wife.

Chemical products, snuff included, are manufactured in Cassel, and it is quite a wide-awake business place—the old town preserved for picturesque effect; and the new town building up for enterprising manufacturers.

Leaving Cassel any day at one o'clock, one can reach Coblenz at half-past seven in the evening, and the Bellevue Hotel will shelter one delightfully for the night, provided a room on the *hof*, or court, is not given. Four hundred feet above the river at Coblenz stands the old fortress of "Ehrenbreitstein." How fine its old gray stone and its commanding situation is! No wonder Auerbach, the novelist, in his "Villa on the Rhine," devoted so many pages to Ehrenbreitstein, the Gibraltar of the Rhine. It cost the government five million dollars. With its four hundred cannon, and capacity to store provision for ten years for eight thousand men in its magazine, well may it scorn attacks "as a tempest scorns a chain."

Instead of driving up to see this monstrous fortress, one may prefer to wander into St. Castor's Church in the early morning, and, like a devout Catholic, kneel and pray. It may be more restful to thus "commune with one's own heart and be still," than to keep up a perpetual sight-seeing. Charlemagne divided his empire among his grandchildren in this very church. It dates to the eighth century, and is one of the best specimens of Lombard architecture in all the Rhine provinces. Coming out

in the morning about ten o'clock, the sun will light up the severe outlines of the great old Ehrenbreitstein across the river, and the thought comes to one, did Luther compose his celebrated hymn, "*Ein feste Burg ist unser Gott*" (A mighty fortress is our God), while in such a moment of inspiration as this scene produces upon the mind?

We left Coblenz at ten o'clock on the steamer "Lorlei" for Mainz. This romantic name for our boat, the waters we were plying, St. Castor's Church on the left, and Ehrenbreitstein on the right, brought a strange combination of war, romance and religion to the mind. The only prosaic moment which seized me was in passing the Lorlei Felsen on the Rhine—when instead of remembering Lorlei, I exclaimed, so my companions told me: "O! here is where they catch the fine salmon!" Rheinstein was to my mind the most beautiful and picturesque castle of all, and being owned by the Crown Prince is kept in becoming repair. The little "*panorama des Rheins*" is a troublesome little companion, for it leaves one not a moment for calm enjoyment and forgetfulness, constantly pointing out the places of interest and crowding their history and romance upon one.

The Dom at Mainz is a curious study for an architect—combining as it does so many styles and containing such curious old tombs.

Frankfort, the birthplace of Goethe, and the native place of the Rothschilds family, has too much history to detail in an article like this. When it was a free city it had, and still retains, I believe, the reputation of being the commercial capital of that part of Germany.

Goethe preferred little Weimar for the development of his poetical life. His father's stately house in Frankfort, still to be seen, was not equal to his own in Weimar.

But let us leave the river Main and the river Rhine and look up Nuremberg and Munich before we follow our southern course to the Adriatic. An erratic journey this, but have we not found some shells which the other conchologists overlooked?

Nuremberg seems to have lost more in population than any German city we know of. Having once numbered 100,000, it now claims only 55,000. It is a curious fact that Nuremberg toys which were so celebrated formerly, have been surpassed in this country, and now American manufactures in this line are taken to Nuremberg and actually sold as German toys. This was told me by a gentleman interested in the trade. But buy a lead-pencil in Nuremberg if you want a good article very cheap—perhaps you can learn to draw or sketch with one, being inspired with the memory of Albert Dürer.

Nuremberg is Bavaria's second largest city, and attracts more foreigners or visitors than Munich, perhaps, yet to the mind of the Bavarian Munich is Bavaria, as to the Frenchman Paris is France, and to the Prussian Berlin is Prussia! No traveler can be contented, however, without some time in Nuremberg, although I dare say many go away disappointed. The old stone houses with their carved gables, the walls and turrets, St. Sebald Church, and the fortress where Gustavus Adolphus with his immense army was besieged by Wallenstein, are things which never grow tedious to the memory. In this fortress now they keep the instruments of torture used in the middle ages to extract secrets from the criminal or the innocent, as it might chance to be. A German in Berlin laughingly told me when I described the rusty torturous things, that they were all of recent manufacture, and were not the genuine articles at all! But new or old, genuine or reproduced, they make one shudder as does Fox's "Book of Martyrs." I know of no church in Germany more worthy of study than St. Sebald's. In it one finds a curious old gold lamp, which swings from the ceiling about half way down one aisle of the church. It is called *die ewige lampe*, because it has been always burning since the twelfth century. It is related of one of Nuremberg's respectable old citizens that he was returning in the darkness one stormy night to his home, and finally almost despairing of finding his way, when a faint

light from the St. Sebald's Church enabled him to arrive safe at his own door. He gave a fund to the church afterward for the purpose of keeping there a perpetual light. When the Protestants took St. Sebald's, as they did so many Catholic churches in Germany after the Reformation, the interest money which the old man gave had still to be used in this way according to his will. So *die ewige lampe* still swings and gives its dim light to the passer-by at night. Our American consul told me a characteristic story of an American girl and her mother, whom he was showing about Nuremberg, as was his social duty, perhaps. They were in St. Sebald's Church, and he related the story of the lamp as they stood near it. Underneath stands a little set of steps which the old sexton ascends to trim the lamp. "Oh!" said this precocious American girl, "I shall blow it out, and then their tradition that it has never been out will be upset." So she climbed the steps fast, and as she was about to do this atrocious thing our consul pulled her back, and said she would be in custody in an hour, and he would not help her out. The mother merely laughed, and evidently saw nothing wrong about the performance. It is just such smart acts on the part of American girls abroad which induce a man like Henry James to write novels about them. The fine, intelligent, self-poised girls travel unnoticed, while the "Daisy Millers" cause the judgment so often passed upon all American girls by foreigners, that they are "an emancipated set."

It was our good fortune while in Munich to board with most agreeable people. The *Herr Geheimrath* (privy counselor) had retired from active life of one kind, to enjoy the privilege of being an antiquarian and art critic. He had his house full of most valuable and curious treasures. The study of ceramics was his hobby, and fayence, porcelain, and earthenwares of the rarest kinds were standing around on his desk, on cabinets, and on the floor. He edited *Die Wartburg*, a paper which was the organ of *Münchener Alterthum-Verein*, and wrote weekly articles *Ueber den Standpunkt unserer heutigen Kunst*. His wife was formerly the *hof-singerin* (court-singer) at the royal opera in Munich, but was then too old to continue. Every Saturday evening she would give a home concert, and would sing the lovely aria from "Freischütz," or Schumann's songs.

St. Petersburg never looked whiter from snow than did Munich that winter. The galleries were cold, but the new and old Pinakothek were too rich to be forsaken. Fortunately the new building was just across the street from the *Herr Geheimrath's*. If it had only been the old Pinakothek I found myself continually saying, for who cares for Kaulbachs, and modern German art, compared with the rich Van Dykes, the Rubens, the Dürers, and the old Byzantine school? I should say the Munich gallery is superior to the Dresden in numbers, but not in gems. But they have fine specimens from the Spanish, the Italian, and German schools.

The Glyptothek is Munich's boast. There is a stately grandeur in this building that suggests Greece and her art. On a frosty morning, to wander out beyond the Propylæum and enter through the great bronze door of the Glyptothek, one feels like a mouse entering a marble quarry. I presume there is no such collection of originals in any country but Italy. Ghiberti, Michael Angelo, Benvenuto, Cellini, Peter Vischer, Thorwaldsen, Canova, Rauch, Schwanthaler, are all represented by original works. But it needs a warm climate to make such a collection of statuary altogether attractive.

Going from Germany to Italy, one takes the "Brenner Pass," generally, over the Alps—the oldest way known, and used by Hannibal. After winding around the side of these snowy peaks, and being blinded by the mists enveloping the landscape, trembling with admiration or fear, as the case may be, a glimpse of sunny Italy is most encouraging.

To reach the Adriatic and Venice is enough earthly joy for some souls. Elizabeth Barrett Browning felt so; and all people feel so, perhaps, who, as Henry James and W. D. Howells, give themselves up to Venice, and write about her until she becomes

identified with their reputation. But let Venice and the Adriatic be silent factors in this article, and let Verona, Florence, and Rome substitute them.

We alighted at Verona at midnight, and in the pale moonlight, which gave a ghastly appearance to the quaint old place. "The Two Gentlemen of Verona" were not to be seen that night. The streets were silent, yet I thought perhaps they might greet us in the morning; but their shadowy old cloaks are only to be seen thrown around a thousand beggars, who are as thick as bees and as ugly as bats.

"The tomb of Juliet" is also a deception—a modern invention; but the house of Juliet's parents (the Capuletti), an old palace, stands as it did in the days when Shakspeare represents its banquetting halls and good cheer.

The scenery from Verona to Florence, with the exception of a few views of the Apennines, is very tedious—nothing beyond almond orchards, which in March, the time of the year I saw them, resembled dead apple trees. You will be surprised to hear that the Italian gentlemen wore fur on their coats. They were, I imagine, traveled gentlemen, for the genuine Italian, whether count or beggar, has a cloak thrown over his shoulders in bewitching folds. When he pulls his large felt hat over his magnificent eyes so that it casts a dark shadow over his mysterious face, and stands in the sunshine, he looks simply a picture.

Verona is more Italian in appearance than Florence. The principal street runs along either side of the river Arno, and is crowded for some distance with little picture and jewelry shops; but farther on toward the *cascine*, or park, the street widens, and is enriched with handsome modern buildings, most of which are hotels. This drive to the *cascine* and the grand hotel was made when Victor Emmanuel allowed the impression to exist that Florence would remain the capital of Italy. This drive is thronged with carriages about four o'clock in the afternoon. It was here I remember to have had the carriage of the Medici family pointed out to me. Within sat two ladies with dark, lustrous eyes, jet hair, and a great deal of lemon color on their bonnets. The livery was also lemon color, and the carriage contained the coat of arms on a lemon-colored panel. The Italians are very partial to this shade of yellow. The beds are draped with material of this same intense hue—very becoming to brunettes, but ruinous, as the young ladies would say, to blondes.

Every one knows of the old Palazzo Vecchio, which rises away above every object in the city of Florence. Its walls are so thick that in them there are places for concealment—little cells—and in one of these the great reformer of Florence, Savonarola, was kept until they burned him at the stake in front of the palace.

"Santa Croce" is the name of the church which contains the tombs of Michael Angelo, Alfieri Galileo, and Machiavelli. Byron, moved with this idea, writes:

"In Santa Croce's holy precincts lie
Ashes which make it holier, dust which is
Even in itself an immortality."

Every American goes to Powers's studio to see the original of the Greek Slave. Next to the Venus of Milo it seems the loveliest study in marble of the female figure. But "our lady of Milo," as Hawthorne calls her—there is no beauty to hers!

The Baptistery in Florence is a curious octagonal church, built in the twelfth century, and has the celebrated bronze doors by Ghiberti, representing twelve eventful scenes from the Bible. Those to the south are beautiful enough, said Michael Angelo, to be the gates of paradise.

As often as I had reflected upon Rome and her seven hills, on arriving there the hills seemed to be a new revelation to me, and the rapid driving of the Italians up and down the steep and narrow streets bewildered me not a little. I found myself on the way from the depot, constantly asking, can this be Rome?

Everything looks so new. The houses are light sandstone, like the buildings in Paris. I was informed that this portion of Rome was calculated to mislead me, and that I would find our hotel quite like Paris and New York houses. The next morning, instead of making a pilgrimage to the Roman forum, the Colosseum, and the palace of the Cæsars, we drove to St. Peter's, which kept me still quite in the notion that Rome had been whitewashed, or something done to destroy her ancient classic aspect. We spent four hours in the great church wandering around and witnessing a procession of priests, monks, and gorgeous cardinals. There is no gewgaw, no tinsel in St. Peter's as one sees in so many other Catholic churches; although gold is used in profusion, yet it is kept in subjection to the tone of the walls. The bronze altar over St. Peter's tomb is wonderfully effective in the way of concentrating color and attention. It is almost necessary to find a niche in the base of some pillar and sit there awhile before plunging into the immensity of this great building, just as a bird gets ready before darting into space. But after all, the feeling of immensity which St. Peter's gives is not so grateful to the religious sense as the Gothic style of architecture, with its stained window, and deep recesses,

"Its long drawn aisles and fretted vaults."

There is little solemnity in St. Peter's, little shade and no music, only from side chapels; but there are grand proportions, perfect simplicity, and the pure light of heaven sending a beam upon a golden dove above St. Peter's tomb, which radiates in a thousand streams of light over the marble pavement.

Nothing impressed me so much in Rome or suggested the ancient glory so much as the ruins of the Baths of Caracalla. The magnificence of this building must have been unparalleled. It accommodated sixteen hundred bathers at once, and some of its walls are so thick one fears to estimate the depth. What would the old Romans have thought of the buildings of the present generation, which fall down or burn up without much warning. Here is solid masonry standing since the year 212.

The different arches and columns of Rome constitute one of the most attractive features to almost every traveller. Let those who enjoy them climb their steps or strain their eyes to decipher in a scorching Italian sun the dates, the seven golden candlesticks, the shew bread, and Aaron's rod, on Titus's arch for example. I shall wander off while they are so occupied into the old capitol—into the room where Rienzi stood and exhorted the people to recover their ancient rights and into the basement below where St. Paul was imprisoned.

The present king had just been crowned at that time. I saw the king and queen in a procession where they were driving to gratify the people, and again we saw him unattended driving with his brother through the grounds of the Borghese Villa. The carnival was forbidden that year in Rome on account of the death of the King and Pope, but there were out-croppings of it on the streets. The tinsel finery and humbug of it seem so incongruous in ancient classic Rome. I was glad to escape it.

The old Pantheon is too important in its history for any one to write of it, but I have always liked the following paragraph from James Freeman Clarke concerning it: "The Romans in this church, or temple, worshiped their own gods, while they allowed the Jews, when in Rome, to worship their Jewish god, and the Egyptians to worship the gods of Egypt, and when they admitted the people of a conquered state to become citizens of Rome their gods were admitted with them; but in both cases the new citizens occupied a subordinate position to the old settlers. The old worship of Rome was free from idolatry. Jupiter, Juno, and the others were not represented by idols. But there was an impassable gulf between the old Roman religion and modern Roman thought, and Christianity came to the Roman world not as a new theory but as a new life, and now her churches stand by the side of the ruins of the Temple of Vesta and the old empty Pantheon."

ELECTRICITY.

What is it? and what some of its manifestations? The name was given to an occult, but everywhere present, property of material things. First discovered by the ancients in amber (Gr. *electron*) and brought into evidence by friction. It is generally spoken of as a highly elastic, imponderable fluid, or fluids, with which all matter is supposed to be in a greater or less degree charged. Though such fluids have never been discovered as entities, and their existence may be but imaginary, it was asserted to account for facts that otherwise seemed inexplicable.

Definitions of electricity are at hand, and could be easily given; but they do not define or accurately point out that which they designate. All that can be said, with confidence, is that certain phenomena which come within our observation suggest the presence of such fluids, and are not otherwise explained. The answer to the question, "What is it?" must be the honest confession, we do not know. But, if ignorant of what it is, we may yet intelligently study its manifestations. The phenomena are not less capable of satisfactory discussion because the efficient agent producing them is unknown.

The theory of two imponderable fluids or electricities having strong attractive and repellant forces, is adopted because probable, and it helps make the discussion intelligible.

The awakened interest now so widely felt in this branch of natural science is more than just the desire to know what is knowable of the world we live in. At first, and indeed for ages, only the curious studied electricity, and practical men asked "*Cui bono?*" But in the present century it has become an applied science. In no other field have our studies of nature been more fruitful of discoveries practically affecting the multi-form industries, and improving the rapidly advancing civilization of the age.

Some of the skillful inventions for controlling and utilizing this power lying all about us will be mentioned hereafter.

It will be well first to state a few facts that are known and mostly established by experimental tests:

(1) The earth, and all bodies on its surface, with the atmosphere surrounding it, are charged with electricity of greater or less potency. This seems their permanent state, though in some cases, its presence is not easily detected.

(2) In quantity or intensity it is very different in different bodies, as also in the same under different conditions. In some portions of vast objects, as the earth and its atmosphere, it accumulates, immense currents being poured into them, while others are perhaps to the same extent drained.

(3) Through some bodies the subtle fluid may pass with but slight obstruction—and they are called *conductors*. In others the hindrance is greater, and we call them *insulators*. But the difference is only of degrees; as the best conductors offer some obstruction, and the most perfect insulators do not completely insulate. The metals, charcoal, water, and most moist substances, as the earth and animal bodies, offer but little resistance. The atmosphere, most kinds of glass, sulphur, india rubber, vulcanite, shellac, and other resins, with dry silk and cotton, are our best insulators. Friction used to secure electrical manifestations is the occasion rather than the cause of the electricity thus developed or set free. That it does not cause it, even in the sense that it causes heat is evident, since the quantity of electricity bears no proportion to the amount of friction used to produce it.

Though, really, there are not several distinct kinds of electricity, as statical, dynamic, magnetic, frictional, and atmospheric, the nomenclature of the science is at least convenient, and will not mislead. It indicates the methods of production, and makes the discussion of the subject more intelligible. And then the electricity developed or set free by the different methods of excitement, though of the same kind, differs much in degree and intensity.

What is called static electricity is the condition of the subtle force in a state of electrical quiescence; and all electricity in motion, however excited by friction, heat, chemical action, or otherwise, is dynamic.

Perpetual modifications are taking place in electrical condition of all matter, that when made apparent, at first may seem quite inexplicable. The excited currents flow with amazing rapidity. Their actions and re-actions baffle our calculations, and the imagination itself is bewildered by their extent and complexity. Yet by electrical tests and laboratory experiments, carefully employed, the laws of electricity are now as well known as those of any other branch of physical science, and the phenomena, if more startling, are no more mysterious than the manifestations of heat, light and gravitation.

Atmospheric electricity is not different in kind from that brought into evidence by the methods of the experimenter in the laboratory, subject to his control, and much used in the arts and industries of life. The lightning that shineth from the one part under heaven to the other part under heaven, a bright light in the cloud, is the same as the electric spark from the moderately charged receiver, when the positive and negative poles are brought into contact—the same as the less intense spark excited by passing the hand rapidly over the fur on the cat's back when the electrical conditions are favorable.

The storm cloud is a vast receiver and by induction becomes at times highly charged with electricity. If the cloud is at rest, and the heated air grows moist, that which is known as sheet or heat lightning appears in frequent flashes. The imprisoned electricity leaps forth from the bosom or edge of the cloud, but as instantly gathers itself back to its source, and apparently without tension or force enough to crash through the atmosphere to any distant object. The flashes are unaccompanied by the noise of thunder, and may be but reflections on the cloud from a source far beyond. We watch them without fear of danger, and the subdued impression is that of the beautiful.

Amidst the terrific grandeur of the violent thunder storm another form of lightning is seen; either the vivid flash that seems to envelop us, or zigzag, sometimes forked lines that dash across the cloud earthward, and occasionally, as in a return stroke, from the earth to the cloud.

In about the middle of the eighteenth century the identity of lightning with electricity was fully ascertained, and since then the most sublime and startling phenomena of our thunder storms are better understood. Under certain contingencies they must occur. Since the different clouds or portions of the same cloud are charged with different electricities, positive and negative, when these by the winds are brought near each other, or rolled together, fierce explosions follow, and great electrical changes take place in the clouds. Vast supplies of the imprisoned fiery fluid leap from strata to strata, or, if the distance is not too great, and the earth is at the same time strongly electrified, crash down to it through whatever sufficient conductors are found. If those not sufficient to receive and convey the charge be in the path they are dashed aside; men and beasts are killed by the shock, trees and other less perfect conductors are scattered in fragments.

Usually the more prominent objects as masts of ships, trees, and buildings are struck in the lightning's course from the cloud, but occasionally those lowest down, near trees, and even in cellars receive the shock. In these cases the current is probably from the earth, whose electric condition is negative with respect to the clouds that pass over it. In either case the opposite electricities that strongly attract each other, and whose concurrence produces the destructive discharge near the earth's surface are held apart by the stratum of air between them. When the attraction becomes too strong to be resisted by the insulating medium they rush together, in their fiery embrace, the flash and concussion being in proportion to the intensity of the charge.

Do lightning rods protect? Yes; but not perfectly. If

properly constructed, and of sufficient conducting capacity, they are a source of safety, and to discard them as useless is not wise.

The instances in which buildings provided with rods have been struck do not prove them useless; or, as some say, that the rods do harm by attracting the lightning that they are unable to conduct to the earth without injury to the building. The point does not attract, but only catches the electricity that sweeps over it. When violent shocks or explosions occur the rod may be of little service. Its office is to prevent these by silently conducting the excess of electricity from the air. The rod, rightly placed, conducts to the earth all it can, lessening the evil it does not entirely prevent. But all danger is not removed. The position of the opposite poles in the immense battery may be such as to give the stroke a horizontal direction, and far below the point of the rod; such currents have been known to pass long distances through atmosphere and smite with destructive violence objects lying in their path. Against these lateral attacks rods above our roofs are probably little or no protection. Still the more good conductors there are in any locality the less danger, as they prevent the accumulation of electricity.

POACHERS IN ENGLAND.

By JAMES TURVES.

It is somewhat surprising that none of our present-day novelists, like Charles Reade or Thomas Hardy, who are always on the outlook for romantic realism, whether it be in incident or in fact, have had their eyes directed to the rural poachers who abound in every shire. Poachers, though neither quite respectable members of the church nor of society, are more interesting characters than burglars or ticket-of-leave men, who figure frequently in the novelist's pages. And, very strange to say, it has been left to a lady to write the first accounts of poaching episodes, episodes remarkable for their masculine touches and their wonderful grip of open-air reality; Harriet Martineau, in her "Forest and Game Law Tales," astonishes us by her graphic realism and her delicacy of treatment; Charles Kingsley wrote one or two of his pathetic ballads on the subject of a poacher and his wife; Norman Macleod made a Highland poacher the subject of a character sketch; and in our own times Mr. Richard Jefferies, a writer who finds pleasure in minute description and vivid realism, has in his own style of exact word-painting given us a pleasant book about his own experiences as an amateur poacher. But the real poacher, the rural vagabond, the parish character, the ne'er-do-weel, whose life is a living protest against the game-laws, is of more lasting interest than any amateur can ever be.

Viewed from the serene vantage-ground of the philosophy of life, poaching is mean and ignoble, and demoralizing sport to you or me, and is not worth the powder and shot, while the fines and punishments are out of all proportion to the joys; yet there are not wanting apologists for it in this apologetic century. "Poaching! Man, there's no sin in catching a rabbit or snaring a hare. They belong to naebody. Bless you! it's a gentleman's trick, shooting." This is the opinion of any Northern lowland ploughman's wife, as she looks from her red-tiled cottage-door out upon the face of the corn-growing mother earth, which has given her sweet memories and a host of country neighbors and friends.

Sixty years ago peasants could use their guns without let or hindrance, and it was then a common thing for a farm-laborer to go out and have a shot when no sportsman was in the way. Taking an odd shot now and then was never, and is not even now, looked upon by them as poaching. But a noted poacher, nicknamed the Otter, tells me, with a sigh, "Poaching is not what it once was!" And it is true. Not so very long ago it was a very profitable occupation, and comparatively respect-

ble, before railways and telegraph wires and penny newspapers stereotyped metropolitan ideas into all and sundry. An old farmer is pointed out as having made all his money by systematic poaching, and an influential city official is said to have laid his early nest-egg by no other means than being a good shot where he had no invitation to be. To-day even rural society would look down upon a young farmer engaged in poaching. It is no longer sport to gentlemen, says the Otter, and is left to moral vagabonds, the waifs and strays, the parish loafers. The great strides of agriculture, the game-laws, and the artificial breeding of game have driven it into sneaking ways, and robbed it of its robust picturesque adventures. To excel in it a man must give up his nights and days to it—in short, he must become a specialist, and even then it hardly pays.

A genuine poacher has great force of character; he has a genius for field and woodcraft. He is the eldest survivor of rustic romance. His wild life is tinged with the love of adventure, the love of moon and stars, the knowledge of the seasons, the haunts and habits of game, and the power of trapping rabbits in dark woodland glades. No man knows more intimately the night-side of Nature between the chilly hours of midnight and sunrise. In this cold-blooded age there are always some Quixotic individuals, born in the outwardly sleepy villages and lifeless farmsteads, with the love of midnight adventure, who wage long warfare against the game-laws, and who only knuckle under to the law's severity when their health gives way or an enemy turns informer. "Rheumatics plays the mischief with poaching!" exclaims the Otter, referring to the long night-watches in wet ditches and beside hedges for hares on the lea fields. Irrespective of all thought of gain, there is an infatuation to eager spirits in this midnight sport. It appeals to strong, healthy, brave men. Charles Kingsley, in "The Bad Squire," with its strong sympathy and feeling, and its cry of "blood" on all the squire owned, from the foreign shrub to the game he sold, gives us the poacher's wife view, a view we are too apt to ignore or forget, with the weary eyes and heavy heart, that grow light only with weeping, and go wandering into the night. We forget too often that in the hearts of common folk there is the glamor of poetic romance about poaching, and a bitter hatred toward the game-laws. Like Rizpah's son, many a lad has had no other incentive than that "The farmer dared us to do it," and that he found it sweetened by the secret sympathy of the people. Too often, I fear, the game-laws dare a brave rustic into poaching: he has only this one way left to satisfy the insatiable British thirst for field sport. It is gravely whispered that some of the most striking men have tasted its romance; and if all stories be true, the master of the English drama owes to an unlucky deer-poaching incident the lucky turn in his career which sent him to London and to writing plays, and poachers may reasonably claim Shakspeare as their patron saint.

When the strong, sweet ale warms his heart, the poacher boasts of dreadful adventures in the night, of leaping broad mill-dams when chased, of giving fight in the dark, and discomfiting gamekeepers by clever tricks. He paints his exploits in such heroic glory, that the seat next the fire in the ale-house is given him by admiring and fearing rustics. Honesty he ascribes to practicedness in the world's ways, and he looks upon keeping out of jail as the greatest victory that man can achieve. He is the type of man that makes our best soldiers, or, as he phrases it, is paid to stop the gun-shots. He requires no almanac to tell him when the moon is to rise to-morrow, and he could give the gamekeepers lessons. He is to be envied for his quick feeling of life and his sympathy for field and forest sport, and that wild exuberance of spirits which he seems to catch with his hares. It is this rural vagabond—and not Mr. Commonplace Respectability—who rivets young folks' attention; his energy anywhere would achieve success; and he is free from that unpardonable fault, dulness. In the rustic drama of life he is the character that takes hold of us in our best im-

pulses—and is not that the best world of the ideal? He disdains to shoot starlings or black-birds; he is too much a sportsman to pay attention to such small game. He can put his hands to various ways of living; he can collect bird's eggs, shoot wild rock-pigeons for a farmers' club, gather blackberries, or, as they say in Scotland, "brambles," pull young ash-saplings in plantations, and sell them to grooms in the livery stables in town.—*The Contemporary Review*.

EIGHT CENTURIES WITH WALTER SCOTT.

By WALLACE BRUCE.

"The burning sun of Syria had not yet attained its highest point in the horizon, when a knight of the Red Cross, who had left his distant northern home, and joined the host of the Crusaders in Palestine, was pacing slowly along the sandy deserts which lie in the vicinity of the Dead Sea, or as it is called, the Lake Asphaltites, where the waves of the Jordan pour themselves into an inland sea, from which there is no discharge of waters."

This is the graphic opening of "The Talisman." The steel clad pilgrim was entering upon that great plain, once watered even as the Garden of the Lord, now an arid and sterile wilderness, sloping away to the Dead Sea, which hides beneath its sluggish waves the once proud cities of Sodom and Gomorrah;—a dark mass of water "Which holds no living fish in its bosom, bears no skiff on its surface, and sends no tribute to the ocean." It was a scene of desolation still testifying to the just wrath of the Almighty. As in the days of Moses, "The whole land was brimstone and salt; it is not sown, nor beareth, nor any grass groweth thereon." The first sentence of the chapter revealed the descriptive and artistic power of the novelist, for the desolation is made more desolate by the introduction of the solitary horseman, journeying slowly through the flitting sand, under the noontide splendor of the eastern sun.

Almost a century has passed since the triumph of the first crusade. The Latin Kingdom, founded by its leaders, had lasted only eighty-eight years. Jerusalem is again in the hands of the Saracens. The crescent gleams on the Mosque of St. Omar. The cross has been torn from her temples, her shrines profaned, and the worshipers of the Holy Sepulcher murdered or exiled. The second crusade had been a failure, and its history a series of disasters. Thousands perished in the long march across Asia Minor. Those who reached Palestine undertook the siege of Damascus, but the attempt was disastrous. In 1187 a powerful leader of the East appeared in the high-souled and chivalrous Saladin. By wise counsel he united the factions of the Mohammedans, which had been at variance for two hundred years; and on the arrival of the third crusade, with which event we are now dealing, he was enabled to present a solid front of warriors "like unto the sand of the desert in multitude."

The land, where "peace and good will to men" had been proclaimed by the voices of angels, and emphasized by the blessed words of the Son of God, was again converted into a vast tournament field for the armies of Europe and Asia: aye more, even in the mountain passes that guard the Holy City, the mission of the crusaders was sacrificed to petty insults and rivalries. Richard the Lion-hearted and King Philip of France were repeating the old story of Achilles and Agamemnon. The military orders of the Knights of the Temple and the Knights of St. John, which had grown up in Jerusalem, founded as fraternities devoted to works of mercy in behalf of poor pilgrims, had become powerful rivals of each other and the clergy; and by intrigue and dissension purposely fomented the discord. According to the historian Michaud, "On the one side were the French, the German, the Templars and the Genoese; on the other the English, the Pisans, and the Knights of St. John."

These are the historical circumstances with which Scott has to deal; and it is on a mission from such a council, made up of discordant factions, convened during the sickness of Richard, that we find the Knight of the Red Cross, or as he is afterward styled, Kenneth the Scot, bearing a message to the celebrated Hermit of Engaddi. His adventures by the way are as romantic as any recorded in the Knights of the Round-Table; for, as he directed his course toward a cluster of palm trees, he saw suddenly emerge therefrom a Saracen chief mounted on a fleet Arabian horse. As they drew near each other they prepared for battle, each after the manner of his own country. "On the desert," according to an Eastern proverb, "no man meets a friend." The heavy armor of the crusader and his powerful horse are more than an even match for the wily Saracen. The Scottish knight might have been likened in the conflict to a bold rock in the sea, and the swift assaults of the Eastern warrior to the waves dashing against it only to be broken into foam. After a long struggle, which was worthy of a larger audience, the Saracen calls a truce, and the Mohammedan and Christian, so lately in deadly conflict, make their way side by side, each respecting the other's courage, to the well under the clustered palms.

The student of history will find in the description of this hand-to-hand conflict an object-lesson of the garb and manners of the Eastern and Western races; and will learn more in the conversation that follows, as they partake of their scanty meal, of the sentiments and customs of the hostile races than can be gathered from the pages of any history with which I am acquainted: for Sir Walter had the marvelous faculty of absorbing history. He saw everything so vividly that he was able to reproduce it in living forms. As we read his description, we sit with them under the palms; we hear them now responding in courtesy, and again in sharp discussion, as allusion is made to their respective religions or modes of life; and, as they resume their journey, we feel grateful to the novelist for the beautiful figure which he puts in the mouth of the Scottish knight in answer to the Saracen's boast of harem-life as contrasted with a Christian household.

"That diamond signet," says the knight, "which thou wearest on thy finger, thou holdest it doubtless of inestimable value?" "Bagdad can not show the like," replied the Saracen; "But what avails it to our purpose?" "Much," replied the Frank, "as thou shalt thyself confess. Take my war-axe and dash the stone into twenty shivers; would each fragment be as valuable as the original gem, or would they, all collected, bear the tenth part of its estimation?"

"That is a child's question," answered the Saracen; "the fragments of a stone would not equal the entire jewel in the degree of hundreds to one."

"Saracen," replied the Christian warrior, "the love which a true knight binds on one only, fair and faithful, is the gem entire; the affection thou flingest among thy enslaved wives, and half-wedded slaves, is worthless, comparatively, as the sparkling shivers of the broken diamond."

We find both soldiers courteous in conversation, and their example teaches a good lesson to modern controversy; but the "courtesy of the Christian seemed to flow rather from a good natured sense of what was due to others; that of the Moslem, from a high feeling of what was to be expected from himself. The manners of the Eastern warrior were grave, graceful and decorous;" he might have been compared to "his sheeny and crescent-shaped saber, with its narrow and light, but bright and keen, Damascus blade, contrasted with the long and ponderous Gothic war-sword which was slung unbuckled on the same sod."

They pursue their march to the grotto of the Hermit of Engaddi; a man respected alike by Christian and Mohammedan; revered by the Latins for his austere devotion, and by the Arabs on account of his symptoms of insanity, which they ascribed to inspiration. The hermit, once a crusader, was the

man whom Kenneth was to meet. He delivers his message; but at night, while the Saracen slept, Kenneth is conducted to a subterraneous, but elegantly carved chapel, where he meets by chance with the noble sister of King Richard, who with Richard's newly wedded wife, had come hither to pray for the king's recovery. She drops a rose at the knight's feet confirming the approbation which her smiles had already expressed to him in camp, and the story of true love, not destined to run smoothly, is fairly commenced. But as with "Count Robert of Paris," "The Talisman" is not so much a romance as a picture of the strife and jealousy of haughty and rival leaders. Its value, as a historical novel, lies in the portrayal of these discordant elements.

We may read the best history of the crusades, page by page, line by line, only to forget the next month, or the next year, everything save the issue of the long struggle; but "The Talisman," by its wondrous reality, makes a lasting impression upon our minds. We see Richard tossing upon his couch, impatient of his fever and protracted delays. We see the Marquis of Montserrat, and the Grand Master of the Knights Templar walking together in close-whispered conspiracy. We see Leopold, the Grand Duke of Austria, lifting his own banner, with overweening pride, by the side of England's standard. We see Richard dashing aside the attendants of his sick bed, half-clad, rushing forth to avenge the insult, splintering the staff, and trampling upon the Austrian flag. We stand with Kenneth under the starlight, guarding alone the dignity of England's banner, but decoyed away in an unlucky hour by the ring of King Richard's sister, which had been obtained by artifice. We see the flag stolen in that fatal absence, and the noble knight condemned to death, to be saved only by miracle from the fierce wrath of Richard. He is given as a present to the Arabian physician whose art had restored the king to health. We see him again with Richard in the disguise of a Nubian slave. We see a strolling Saracen with poisoned dagger attempting the life of Richard, but saved by the faithful Kenneth. We find Richard considering in his mind the giving of his royal sister in marriage to Saladin; an affair which fortunately needed the lady's consent, who had in her veins too much of the proud Plantagenet blood to know the meaning of compulsion. We see the tournament which decided the treachery of Conrad, and the triumph of Kenneth, who turns out to be no other than the Earl of Huntingdon, heir of the Scottish throne. The comrade of Kenneth, and the physician who waited upon the king, chances to be the same person, and no less renowned a hero than the Emperor Saladin, who sends as a nuptial present to Kenneth and Edith Plantagenet the celebrated talisman by which he had wrought so many notable cures; which, according to Scott, is still in existence in the family of Sir Simon of Lee.

This tale of the crusaders is so complete that we need after closing the volume only a few lines of history to complete the record. The city of Ptolemais was captured after a three years' siege. More than one hundred skirmishes and nine great battles were fought under its walls. Both parties were animated by religious zeal. It is said that the King of Jerusalem marched to battle with the books of the Evangelists borne before him; and that Saladin often paused upon the field of battle to recite a prayer, or read a chapter from the Koran. Philip finally returns to France. Richard remains in command of one hundred thousand soldiers. He conquers the Saracens in battle, repairs the fortifications of Jaffa and Ascalon, but in the intoxication of pleasure forgets the conquest of Jerusalem. His victories were fruitless. He obtained from Saladin merely a truce of three years and eight months, "which insured to pilgrims the right of entering Jerusalem untaxed," and, without fulfilling his promise of striking his lance against the gates of the Holy City, sets off on his homeward journey, to be taken captive and held a prisoner in a Tyrolese castle. In brief the history of the Third Crusade is that of a house divided against itself.

As "The Betrothed" brought us back from Constantinople and

Palestine to Merrie England, so "Ivanhoe" transports the reader, and some of the prominent actors of the drama, from the eastern shores of the Mediterranean to the pleasant district of the West Riding of Yorkshire, watered by the river Don, "where flourished in ancient times those bands of gallant outlaws, whose deeds have been rendered so popular in English song."

The prominent historical features which Scott illustrates in the romantic story of "Ivanhoe" are the domestic and civil relations existing between the Saxon and the Norman about the year 1196, when the return of Richard the First from Palestine and captivity was an event rather hoped for than expected; and an event *not* hoped for by King John and his followers.

The Saxon spirit had been well nigh subdued by the strict and unjust laws imposed by the Norman kings. For one hundred and thirty years Norman-French had been the language of the court, the language of law, of chivalry and justice. The laws of the chase and the curfew,—and many others unknown to the Saxon constitution,—had been placed upon the necks of the inhabitants of the soil. With few exceptions the race of Saxon princes had been extirpated; and it was not until the reign of Edward III. that England became thoroughly united as one people. The English language at the close of the twelfth century was not yet born. The Saxon mother and Norman father were not yet wedded; the two languages were gradually getting acquainted with each other; or, as Scott has logically expressed it, "the necessary intercourse between the lords of the soil, and those oppressed inferior beings by whom that soil was cultivated, occasioned the formation of a dialect, compounded betwixt the French and the Anglo-Saxon, in which they could render themselves mutually intelligible to each other; and from this necessity arose by degrees the structure of our present English language, in which the speech of the victors and the vanquished has been so happily blended together, and which has since been so richly improved by importations from the classical languages, and from those spoken by the southern nations of Europe." In the first chapter—and it is always well to read carefully the first chapter of Scott—we are introduced to a swine-herd, born thrall of Cedric of Rotherwood, one of the few powerful Saxon families existing in England at the time of our story. He is attended by a domestic clown, or iester, maintained at that time in the houses of the wealthy. With an art and unity like Shakspeare, Scott emphasizes at the very outset the chief historic feature of his story, by putting the following conversation in the mouths of these Saxon menials:

"How call you those grunting brutes running about on their four legs?" demanded Wamba, the jester.

"Swine," said the herd.

"And swine is good Saxon," said the jester; "but how call you it when quartered?"

"Pork," answered the cow-herd.

"And pork," said Wamba, "is good Norman-French; and so when the brute lives, and is in the charge of a Saxon slave, she goes by her Saxon name; but becomes a Norman, and is called *pork*, when she is carried to the castle-hall to feast among the nobles. Nay, I can tell you more," said Wamba, in the same tone, "there is Alderman Ox, who continues to hold his Saxon epithet, while he is under the charge of serfs and bondsmen such as thou, but becomes *beef*, a fiery French gallant, when he arrives before the worshipful jaws that are destined to consume him. Mynheer Calf, too, becomes Monsieur de *Veau* in the like manner; he is Saxon when he requires tendance, and takes a Norman name when he becomes matter of enjoyment."

The third chapter brings together a strange gathering under the roof of the hospitable Cedric: Brian de Bois Gilbert, a haughty Templar; Prior Aymer, of free and jovial character; a poor Palmer, just returned from the Holy Land, and a Jew known as Isaac of York; all journeying on their way to a tournament to be held a few miles distant at Ashby de la Zouche. Lady Rowena, descended from the noble line of Alfred, graced the table with her presence, a ward destined by Cedric, but not by

fate, to be the wife of Athelstane,—a Saxon descended from Edward the Confessor: in the furtherance of which idea his only son had been exiled, when it became known that he aspired to the hand of the Saxon beauty.

At the tournament the remaining characters of the drama are introduced: King John, with his retinue; Richard the Lion-Hearted, under the disguise of the "Black Knight;" Rebecca, the Jewess; the proud baron Front de Bœuf; Robin Hood, the brave outlaw, under the name of Loxley; and Ivanhoe, the poor pilgrim, who wins the prize at the tournament and crowns Rowena Queen of Beauty. At the close of the second day's tournament, in which Ivanhoe is again successful, a letter is handed to King John with the brief sentence, "Take heed to yourself, for the devil is unchained." It was like the handwriting on the wall of Belshazzar's palace, and proclaimed the end of his kingdom.

Cedric, Rowena, Isaac, Rebecca, Athelstane and Ivanhoe depart their several ways from the tournament, but are captured and taken to Front de Bœuf's castle. Cedric escapes in the guise of a monk. The castle is stormed, and now occurs one of the most dramatic pictures in the pages of romantic literature, destined to reveal to all time the undying hate between the Saxon and the Norman. A Saxon woman, by name Ulrica, had lived for years in Front de Bœuf's castle. She had seen her father and seven brothers killed in defending their home, but she "remained to administer ignominiously to the murderers of her family. She used the seductions of her beauty to arm the son against the father; she heated drunken revelry into murderous broil, and stained with a parricide the banqueting hall of the conquerors." She had sold body and soul to obtain revenge for Norman cruelties; and now, grown old in servitude, incensed by the contempt of her masters, she determines upon a deed, which will make the ears of men tingle while the name of Saxon is remembered. She fires the castle and appears on a turret in the guise of one of the ancient furies, yelling forth a war-song. "Her long, dishevelled grey hair flows back from her uncovered head; the inebriated delight of gratified vengeance contends in her eyes with the fire of insanity; and she brandishes the distaff which she holds in her hand, as if she were one of the fatal sisters, who spin and abridge the thread of human life. At length, with a terrific crash, the whole turret gives way, and she perishes in the flames which consume her tyrant."

There is another historic feature of the times emphasized in this romance: the oppression of the Jews in England during these cruel and adventurous times. The character of the race is vividly portrayed in Isaac of York, in which masterly delineation Scott seems truer to nature than Shakspeare in the character of Shylock. Rebecca, his noble and beautiful daughter, is the type of all that is pure and womanly. Her words have the eloquence of the poets and prophets of old: "Know proud knight," she says, "we number names amongst us to which your boasted Northern nobility is as the gourd compared with the cedar—names that ascend far back to those high times when the Divine Presence shook the mercy seat between the cherubim, and which derive their splendor from no earthly prince, but from the awful Voice, which bade their fathers be nearest of the congregation to the vision; such were the princes of the house of Jacob; now such no more. They are trampled down like the shorn grass, and mixed with the mire of the ways; yet there are those among them who shame not such high descent, and of such shall be the daughter of Isaac, the son of Adonikam. Farewell! I envy not thy blood-won honors; I envy not thy barbarous descent from northern heathens; I envy not thy faith, which is ever in thy mouth, but never in thy heart nor in thy practice."

The description of Friar Tuck entertaining King Richard in disguise is in Scott's happiest vein; and Robin Hood, with his bold outlaws, shares the honors gracefully with knights and nobles. But it is alike unnecessary and unprofitable to attempt

a condensation of "Ivanhoe." No outline can convey the beauty of a finished picture. It is not to be taken at second hand. It is only for us to indicate its relation to history; and it will suffice to say that King Richard was gladly welcomed by the English people, and that Ivanhoe was wedded to the beautiful Rowena.

But, do I hear the reader ask, what becomes of the fair Jewess? Scott has answered the question so beautifully in his preface that I borrow his own words—a passage to my mind unsurpassed in English prose: "The character of the fair Jewess found so much favor in the eyes of some fair readers, that the writer was censured, because, when arranging the fates of the characters of the drama, he had not assigned the hand of Wilfred to Rebecca, rather than the less interesting Rowena. But, not to mention that the prejudices of the age rendered such an union almost impossible, the author may, in passing, observe, that he thinks a character of a highly virtuous and lofty stamp, is degraded rather than exalted by an attempt to reward virtue with temporal prosperity. Such is not the recompense which Providence has deemed worthy of suffering merit, and it is a dangerous and fatal doctrine to teach young persons, the most common readers of romance, that rectitude of conduct and of principle are either naturally allied with, or adequately rewarded by, the gratification of our passions, or attainment of our wishes. In a word, if a virtuous and self-denied character is dismissed with temporal wealth, greatness, rank, or the indulgence of such a rashly formed or ill-assorted passion as that of Rebecca for Ivanhoe, the reader will be apt to say, 'Verily, virtue has had its reward.' But a glance on the great picture of life will show that the duties of self-denial and the sacrifice of passion to principle are seldom thus remunerated; and that the internal consciousness of their high-minded discharge of duty produces on their own reflections a more adequate recompense in the form of that peace which the world can not give or take away."

THE GREAT ORGAN AT FRIBOURG.

By EDITH SESSIONS TUPPER.

After thoroughly "doing" Berne in most approved guide-book fashion; feeding the bears—hot, dusty looking creatures; standing in the middle of the street, heads thrown back at the risk of dislocating our necks to watch the celebrated clock strike, we stand one evening on the hotel terrace and take our farewell look at the Bernese Alps. Sharply defined against a sunset-flushed sky, as if cut from alabaster, glittering fair and white like the pinnacles and domes of a city celestial, rise the Mönch, Eiger, Wetterhorn, and, serene and august in her icy virgin beauty, the Jungfrau.

"Too soon the light began to fade,
Tho' lingering soft and tender;
And the snow giants sank again
Into their calm dead splendor."

Leaving Berne, we take our way to Fribourg, to see its wonderful gorges and skeleton bridges, and hear its more wonderful organ. On our arrival at this quaint old Romanesque town, we are driven to the most delightful little hotel, hanging on the very edge of the great ravine, upon the sides of which the town is built. Through the more closely-built region of the town runs the old stone wall with its high watch-towers. Spanning the great gulf are the bridges—mere phantoms of bridges they seem from our windows. A dreary, drizzling rain sets in soon after we arrive, and some American lads across the court-yard from time to time send forth in their sweet untrained voices the refrain of that mournful ballad, the "Soldier's Farewell,"

"Farewell, farewell, my own true love."

A prevalent tone of *heimweh* is in the air; eyes are filling,

and memory is stretching longing hands over the ocean, when fortunately comes the summons to *table d'hôte*. At our plates we find programs in very bad English of a concert to be given this evening upon the great organ in the cathedral. Thither we go at dusk, pausing a moment to look at the grotesque carving of the last judgment over the great door. Thereon the good, with most satisfied faces, are being admitted to heaven by St. Peter, a stout old gentleman in a short gown, jingling a bunch of keys; while the wicked are being carried in Swiss baskets to a great cauldron over a blazing fire, therein to be deposited, and to be stirred up by devils armed with pitchforks for that purpose. We enter. Without, the ceaseless drip of the rain; within, gloom, darkness—save for the never-ceasing light before the altar, decay. The air is chill and damp. Around us stretch dark, shadowed aisles. Tombs of those long dust are on every hand. The air seems peopled with ghosts. We are seated, and patiently wait for life to be breathed into that mighty monster looming up in the darkness, above our heads. Suddenly, with a crash that shakes the building, the organ speaks. Silenced, overwhelmed, we listen, possessing our souls in patience for the "Pastorale," representing a thunder storm among the Alps, which is to close the evening's entertainment. We have but recently come from the everlasting hills, and our souls are still under their magic enchantment. At last the moment comes. A pause, and there steals upon the ear a light, sweet refrain. It is spring, the old, ideal spring; the trees are budding; flowers are smiling from the meadows; we feel warm south winds blowing; afar in the woods we hear the sylvan pipe of the shepherd and the songs of birds. A peace is upon everything. Nature is calm, happy, and full of promise of glad fruition. To this succeeds a languid, dreary strain—it is a drowsy summer afternoon. A delicious languor pervades the air; we hear the trees whispering to each other of their perfect foliage; we hear the laughing waters leaping and calling to each other through their rocky passes; the flocks are asleep in the shade; the shadows are stealing and playing over the sides of the mountains, and the whole world swims in a misty, golden haze. Now listen closely. Do not we catch the mutter of distant thunder? And again, do not we hear that clear, bell-like bird-call for rain? The distant muttering grows louder, a stronger breeze sways the trees; still we hear distinctly that bird-call. Now louder rolls the thunder, the wind has arisen, the trees are bending to meet it, and in rage are tossing their boughs to the overcast sky; and ah! here comes the rain. Patter, patter, at first, now fast and faster, and now with a mad rush down it comes in one tremendous, outpouring sheet, and now with a terrific rumble and crash,

"From peak to peak the rattling crags among,
Leaps the live thunder:
Not from one lone cloud,
But every mountain now hath found a tongue,
And Jura answers from her misty shroud
Back to the joyous Alps who call on her aloud."

The wind shrieks and howls, and yet above all this tumult and roar of the elements, clearly and unmistakably rings that sweet flute-like bird-call. The storm rages, spends its fury, and dies away, and from a neighboring cloister come the voices of an unseen choir, raising a "Te Deum" to him who holds the storms in his hands. Silently we rise and go, a great peace upon us, for divine notes from the soul of the organ have entered into ours.

It is not the nature of man to be always moving forward; it has its comings and goings. Fever has its cold and hot fits, and the gold shiver proves the height of the fever quite as much as the hot fit. The inventions of man from age to age proceed much in the same way. The good nature and the malice of the world in general have the same ebbs and flows. "Change of living is generally agreeable to the rich."—*Pascal*.

ECCENTRIC AMERICANS.

By COLEMAN E. BISHOP.

II.—THE STATESMAN IN A STATE OF NATURE.

David Crockett was born in the wilds of Tennessee, August 17, 1786. He toughened rapidly, like a bear's cub, but he showed in addition to the usual woodsman's instincts the unusual qualities of great tenderness of feeling and generosity, with a remarkable gift of wit and love of fun. The incredible stories of his hardships at the age of twelve and thereafter we have not room to recount. In the best sense he was a tough boy. The closing scene of his home life—if a hut presided over by a drunken father, and a mother who left no impression on the boy's character that showed itself in after years can be by any courtesy called a home—was a dissolving view of a ragged, bare-footed urchin of fourteen chased through the brush by a father with a large goad and a large load of liquor. Thus David Crockett set out upon the world for himself.

With Crockett's story as a bear-hunter, nomadic woodsman, soldier and Indian-fighter, exciting and marvelous as are these incidents of the first thirty years of his life, we shall not much concern ourselves. But I do wonder that his life-like, quaint narrative of these has not become standard juvenile literature, along with Robinson Crusoe and Mayne Reid's stories of adventure. Through all these exciting though isolated years, the young woodsman picked up a good deal of practical knowledge, not one scrap of which he ever forgot; and withal was developing a strange quality of unpretentious self-esteem. "The idea seemed never to have entered his mind that there was any one superior to David Crockett, or any one so humble that Crockett was entitled to look down upon him with condescension. He was a genuine democrat, and all were in his view equal. And this was not the result of thought, of any political or moral principle. It was a part of his nature, like his stature or complexion. This is one of the rarest qualities to be found in any man."*

He also was developing oratorical powers. He acquired unbounded popularity at musters and frolics, in camp and in the chase by his fun-making qualities, his homely, kindly, keen wit. His retentive memory was an inexhaustible store-house of anecdote, and he always had an apt illustration for any point he wanted to make. He began to taste the sweet consciousness of power over his fellows, and to easily fall into the position of leadership, for which nature designed him.

His first official position came to him at about the age of thirty. There were a good many outlaws in the region where he at that time had his cabin and claim, and society began to cohere for self-protection. The settlers convened and appointed Crockett and others to be justices of the peace, and a corps of stalwart young men to be constables. These justices were really provost-marshal in power. There were no statute laws nor courts; but there was authority enough, and Crockett says everybody made laws according to his own notions of right. For shooting and appropriating a hog running at large, for instance, the sentence was to strip the thief, tie him to a tree and give him a flogging, burn down his cabin and drive him out of the country. Soon after, the new territory was organized into counties and Crockett was regularly commissioned a justice by the legislature. His account of his administration is interesting:

"I was made a squire according to law; though now the honor rested on me more heavily than before. For, at first, whenever I told my constable, says I, 'catch that fellow and bring him up for trial!' away he went, and the fellow must come, dead or alive. For we considered this a good warrant, though it was only in verbal writings. But after I was appointed by the Assembly, they told me my warrants must be in real

writing and signed; and that I must keep a book and write my proceedings in it. This was a hard business on me, for I could just barely write my own name. But to do this, and write the warrants too, was at least a huckleberry over my persimmon. I had a pretty well informed constable however, and I told him when he should happen to be out anywhere and see that a warrant was necessary and would have a good effect, he needn't take the trouble to come all the way to me to get one, but he could just fill one out, and then on the trial I could correct the whole business if he had committed any error. In this way I got on pretty well, till by care and attention I improved my handwriting in such a manner as to be able to prepare my warrants and keep my record-books without much difficulty. My judgments were never appealed from: and if they had been they would have stuck like wax, as I gave my decisions on the principles of common justice and honesty between man and man, and relied on natural born sense, and not on law learning, to guide me; for I had never read a page in a law-book in all my life."

Crockett made his first stump speech when he was about thirty-four years old. A militia regiment was to be organized, and a Captain Mathews, after promising Crockett the majority of the regiment if he would support him for its colonel, turned against Crockett in favor of his own son. At a great muster prepared by Mathews, he made a stump speech in his own and his son's favor. Crockett, entirely unabashed, mounted the stump as soon as Mathews finished, and on the captain's own grounds proceeded to expose his duplicity and argue the total unfitness of both him and his son for the command. The speech was fluent, witty, full of anecdote, and carried the rude audience by storm. It effectually beat both father and son. The fame of this maiden effort traveled ~~fast~~ in a community where oratory was the great, if not the ~~only engine of~~ popular control, and the result was that a committee soon waited on Crockett and asked him to stand for the legislature ~~then about to be elected~~ (1821). Some of his first electioneering adventures illustrate the frankness and tact so ~~queerly combined in~~ him, and also show how he got his education in politics. Hickman county wanted to change its county seat. He says: "Here they told me that they wanted to move their town nearer to the center of the county, and I must come out in favor of it. I did not know what this meant, or how the town was to be moved, and so I kept dark, going on the same identical plan that I now find is called *non-committal*."

On one occasion the candidates for governor of the State, Congress, and several for legislature, some of them able stump-speakers, were announced. As he listened, a sense of inferiority for the first time, probably, penetrated him; he drank in all they said, and remembered it. He says:

"The thought of having to make a speech made my knees feel mighty weak, and set my heart to fluttering almost as bad as my first love scrape with the Quaker's niece. But as luck would have it, these big candidates spoke nearly all day, and when they quit the people were worn out with fatigue, which afforded me a good apology for not discussing the government. But I listened mighty close to them, and was learning pretty fast about political matters. When they were all done I got up and told some laughable story and quit."

He was elected, and in the legislature proved a good storyteller, a formidable antagonist in repartee, and above all a good listener. He says the first thing that he took pains to learn was the meaning of the words "judiciary" and "government," as up to that time he had "never heard that there was any such thing in all nature as a judiciary." The halls of the Tennessee legislature were again brightened in 1823-24 by the wit and good sense of "the gentleman from the cane" as an opponent derisively dubbed him, very much to his subsequent regret.

Crockett was now so well known that he was put forward for Congress. His rapid advancement staggered even his self-sufficiency, and he objected, saying he "knew nothing about Congress matters." Fortunately, perhaps, he was given time to learn more, for he was beaten at the polls this time. It was

claimed by his supporters the result was obtained by fraud, and as the adverse majority was small, he was urged to contest the election; but he declined, saying he did not care enough for office to take it unless the clearly expressed will of the people called him thereto. From hunting for men he turned with zest to hunting for bears; his endurance, hardihood and success, and the never-failing benevolence with which he divided the fruits of the hunt with poor settlers, or lent a helping hand in many other ways, made him more political capital than the best stump speeches could have done. He killed one hundred and five bears one season. Two years later (1827) he ran for Congress again and was triumphantly elected over two strong opponents. Thus the bear-hunting, Indian-fighting "gentleman from the cane," barely able to write his name, so poor that he had to borrow money to pay his traveling expenses to Washington, became a law-maker of a great nation by sheer force of native talent and goodness of heart.

His fame preceded him to Washington. His prowess in arms, his dexterity in politics, and his quaint wit had been in the papers; all his sayings had been, as is the style of American journalism, exaggerated and embellished and distorted, until the general impression of him was that of a coarse, outlandish, swaggering yahoo. His appearance in Washington dispersed these illusions thence, but the misrepresentations did not cease in the prints. As in the case of Lincoln, every profane and vulgar thing that cheap wit could invent was attributed to Crockett, and received as his. Many of these false impressions survive to this day; it is therefore proper here to give a picture of the man as he was seen at home. It is thus reported by an intelligent gentleman who visited his cabin just after his election. The visitor penetrated to Crockett's cabin eight miles through unbroken wilderness by a path blazed on the trees. He says:

Two men were seated on stools at the door, both in their shirt-sleeves, engaged in cleaning their rifles. As the stranger rode up, one of the men came forward to meet him. He was dressed in very plain homespun attire, with a black fur cap upon his head. He was a finely proportioned man, about six feet high, apparently forty-five years of age, and of very frank, pleasing, open countenance. He held his rifle in his hand, and from his right shoulder hung a bag made of raccoon-skin, to which there was a sheath attached containing a large butcher-knife.

"This is Colonel Crockett's residence, I presume," said the stranger.

"Yes," was the reply, with a smile as of welcome.

"Have I the pleasure of seeing that gentleman before me?" the stranger added.

"If it be a pleasure," was the courteous reply, "you have, sir."

"Well, Colonel," responded the stranger, "I have ridden much out of my way to spend a day or two with you, and take a hunt."

"Get down, sir," said the Colonel, cordially. "I am delighted to see you. I like to see strangers. And the only care I have is that I can not accommodate them as well as I could wish. I have no corn, but my little boy will take your horse over to my son-in-law's. He is a good fellow, and will take care of him."

Leading the stranger into his cabin, Crockett very courteously introduced him to his brother, his wife, and his daughters. He then added:

"You see we are mighty rough here. I am afraid you will think it hard times. But we have to do the best we can. I started mighty poor, and have been rooting 'long ever since. But I hate apologies. What I live upon always, I think a friend can for a day or two. I have but little, but that little is as free as the water that runs. So make yourself at home."

He seemed to have a great horror of binding himself to any man or party. "I will pledge myself to no administration," he said. "When the will of my constituents is known, that will be my law; when it is unknown my own judgment shall be my guide." So clear and lofty an idea had this unlearned man formed of the duties of a representative! Well for the country if as high a standard of political duty even now prevailed among the best and wisest legislators!

Nothing is recorded of his first term in Congress except that he "brought down the house" every time he spoke, and once so discomfited a colleague that a duel was talked of; upon which Crockett gave out that if any one challenged him he should select as their weapons *bows and arrows*.

He was re-elected in 1829. This was the Jackson tidal wave—the inauguration of that craze of hero-worship and spoils-grabbing which entailed its curse upon our politics, even to this day. During this term came the turning point in Crockett's career and a triumphant test of the strength of his character. At first he supported Jackson's administration and acted with the party. But when that "constitutional democrat" blossomed out into an unconstitutional autocrat, one man of his party was found manly enough to act upon his own convictions. One of these unconstitutional measures was an act to vote half a million of dollars for disbursements made without color of law, and Crockett opposed it. The result is best told in his own words:

"Soon after the commencement of this second term, I saw, or thought I did, that it was expected of me that I would bow to the name of Andrew Jackson, and follow him in all his motions, and mindings, and turnings, even at the expense of my conscience and judgment. Such a thing was new to me, and a total stranger to my principles. I know'd well enough, though, that if I didn't 'hurrah' for his name, the hue and cry was to be raised against me, and I was to be sacrificed, if possible. His famous, or rather I should say his *infamous* Indian bill was brought forward, and I opposed it from the purest motives in the world. Several of my colleagues got around me, and told me how well they loved me, and that I was ruining myself. They said this was a favorite measure of the President, and I ought to go for it. I told them I believed it was a wicked, unjust measure, and that I should go against it, let the cost to myself be what it might; that I was willing to go with General Jackson in everything I believed was honest and right; but, further than this, I wouldn't go for him or any other man in the whole creation.

"I had been elected by a majority of three thousand five hundred and eighty-five votes, and I believed they were honest men, and wouldn't want me to vote for any unjust notion, to please Jackson or any one else; at any rate, I was of age, and determined to trust them. I voted against this Indian bill, and my conscience yet tells me that I gave a good, honest vote, and one that I believe will not make me ashamed in the day of judgment. I served out my term, and though many amusing things happened, I am not disposed to swell my narrative by inserting them.

"When it closed, and I returned home, I found the storm had raised against me sure enough; and it was echoed from side to side, and from end to end of my district, that I had turned against Jackson. This was considered the unpardonable sin. I was hunted down like a wild varment, and in this hunt every little newspaper in the district, and every little pin-hook lawyer was engaged. Indeed, they were ready to print anything and everything that the ingenuity of man could invent against me."

It proved as he had anticipated; he failed of re-election, but only by a majority of seventy votes. Two years of bear-hunting followed, during which Crockett thirsted for the nobler pursuit of ambition of which he had had a taste. Some of his predictions as to Jackson's course had been verified, and many things conspired to open his constituents' eyes to the high character of their representative's course. In the canvass of 1833 he was elected the third time, winning one of the most remarkable political triumphs ever known in this country. He had against him all the education, talent and wealth of his district; the administration made it a test vote, and all that promises of reward, threats of punishment, political and social, unlimited money, the influence of the national banks, and every appliance that the most tyrannical disposition ever dominant in our affairs could bring to bear were used. Men of genius, eloquence, influence and fortune rode the district; whiskey was free as water. The entire press opposed Crockett with the ingenuity and abandon which only "patronage" can inspire. More than all this the common people of the district, with whom lay Crockett's influence, if he had any, wor-

shipped "Old Hickory," under whom many of them had fought. Against these odds the impoverished, uneducated hunter, with no aid but his natural gifts and a clean record, canvassed the district of seventeen counties and 100,000 inhabitants and won. This remarkable victory in Jackson's own State, when his popularity was at its height, gave Crockett a new and better title to respect than any he had before presented; and it increased the mystery hanging about this strange, uncultured genius. The world abandoned its preconceived notions of the back-woodsman when it saw his power; but it was at loss to conceive a true idea of him.

During this session of Congress (1833-34) Crockett wrote his autobiography. As might be expected, it is a very unique work. Its style is simple and vigorous; the language is Shaksperian in its monosyllables and short sentences, but the *ensemble* is graphic, and as the events narrated are of the most extraordinary kind, it makes very exciting reading. On the title page appears his famous motto:

"I leave these words for others when I'm dead;
Be always sure you're right, then GO AHEAD!"

Crockett submitted the manuscript of this work to a critic for revision; but he declared afterward that the reviser had not improved the work—probably because he toned down its vigorous language. Such expressions as "my son and me went," occur, and spelling like this: "haw," "tuff," "scaffled," "clomb" (for climbed); "flower" (for flour). But he positively objected to some of the orthographical corrections, as he said "such spelling was contrary to nature." He brought the narrative of his life up to the date, and concluded it as follows:

"I am now here in Congress, this 28th day of January, in the year of our Lord 1834; and, what is more agreeable to my feelings, as a free man. I am at liberty to vote as my conscience and judgment dictate to be right, without the yoke of any party on me or the driver at my heels with the whip in hand commanding me to 'gee-wo-haw!' just at his pleasure. Look at my arms: you will find no party handcuffs on them! Look at my neck: you will not find there any collar with the engraving,

MY DOG.—ANDREW JACKSON.

But you will find me standing up to my rack as the people's faithful representative, and the public's most obedient, very humble servant,

"DAVID CROCKETT."

What would not senators and representatives of to-day give for the same independence? What health and manliness it would impart to public life, if every legislator were thus free of handcuffs and collars!

In the spring of 1834, Crockett made his famous "starring tour" through the East. From Philadelphia to Portland, and back to Washington, it was a continuous ovation. Crockett and the populace were mutually astonished; he at his receptions, and they at the actions, appearance, and utterances of the man who had been represented to them by his political opponents as a buffoon and semi-savage. He was more than all impressed with the developments of wealth and enterprise in the North; he frankly confessed the prejudices he had formed against the Yankees, and praised their thrift and principles. He spoke well and appropriately on each occasion, though—strange change in him!—with evident confusion at the lionizing. He wrote of the ovation he received on landing in Philadelphia:

"It struck me strangely to hear a strange people huzzaing for me; it took me so uncommon unexpected, as I had no idea of attracting attention. The folks came crowding around me, saying, 'Give me the hand of an honest man.' I thought I had rather be in the wilderness with my gun and dogs, than to be attracting all that fuss."

In a happy little speech here, from the hotel balcony, he said:

"I am almost induced to believe this flattery—perhaps a burlesque. This is new to me, yet I see nothing but friendship in your faces."

At a grand banquet in New York City, Crockett having been toasted as "The undeviating supporter of the constitution and

the laws," made this neat and characteristic hit, as he reports it:

"I made a short speech, and concluded with the story of the red cow, which was, that as long as General Jackson went straight, I followed him; but when he began to go this way, and that way, and every way, I would n't go after him; like the boy whose master ordered him to plough across the field to the red cow. Well, he began to plough, and she began to walk; and he ploughed all forenoon after her. So when the master came, he swore at him for going so crooked. 'Why, sir,' said the boy, 'you told me to plough to the red cow, and I kept after her, but she always kept moving.'"

Most enthusiastic of all was his reception in Boston, where President Jackson's policy was most unpopular. It was even proposed to confer on Crockett the degree of LL.D., an honor that had been awarded to Jackson: but, unlike Jackson, Crockett had the wit to decline an honor which neither of the two deserved.

The more he saw and heard the more humble he became. When called up for an after-dinner speech in Boston he burst out in his honest way—"I never had but six months' schooling in all my life, and I confess I consider myself a *poor tyke* to be here addressing the most intelligent people in the world." If he had not culture, he had what was far more rare in that age of truckling to one-man power—*manhood*. It seemed as if unlettered David Crockett was the only man in public life to stand up straight, and people acknowledged the power of true character. The culture and wealth of the East bowed to unspoiled manhood; it was a revelation fresh from Nature's hand.

A few extracts from one of his more sustained and dignified efforts will illustrate the development Crockett had attained by simple observation. After praising New England he said:

"I don't mean that because I eat your bread and drink your liquor, that I feel so. No; that don't make me see clearer than I did. It is your habits, and manners, and customs; your industry; your proud, independent spirits; your hanging on to the eternal principles of right and wrong; your liberality in prosperity, and your patience when you are ground down by legislation, which, instead of crushing you, whets your invention to strike a path without a blaze on a tree to guide you; and above all, your never-dying, deathless grip to our glorious Constitution. These are the things that make me think you are a mighty good people.

"I voted for Andrew Jackson because I believed he possessed certain principles, and not because his name was Andrew Jackson, or the 'Hero,' or 'Old Hickory.' And when he left those principles which induced me to support him, I considered myself justified in opposing him. This thing of man-worship I am a stranger to; I don't like it; it taints every action of life.

"I know nothing, by experience, of party discipline. I would rather be a raccoon-dog, and belong to a Negro in the forest, than to belong to any party, further than to do justice to all, and to promote the interests of my country. The time will and must come, when honesty will receive its reward, and when the people of this nation will be brought to a sense of their duty, and will pause and reflect how much it cost us to redeem ourselves from the government of one man. It cost the lives and fortunes of thousands of the best patriots that ever lived. Yes, gentlemen, hundreds of them fell in sight of your own city.

"Gentlemen, if it is for opposing those high-handed measures that you compliment me, I say I have done so, and will do so, now and forever. I will be no man's man, and no party's man, other than to be the people's faithful representative: and I am delighted to see the noble spirit of liberty retained so boldly here, where the first spark was kindled; and I hope to see it shine and spread over our whole country."

He took his seat in Congress, a central object in the political field. His position was anomalous. Party ties were closely drawn, and party rancor bitter as it can be only when nothing but plunder is at stake between parties. The Democrats could not claim Crockett so long as he antagonized their god, Jackson; and the alliance of the Whigs he most distinctly repudiated. He was an independent, an "unattached statesman;" the prototype of an element which has now become formid-

able in our politics, but a character for whom there was no place in those times. He was, like all eccentrics, ahead or apart from his age, and was at first feared, then shunned, and then called crazy by the great body of public men, whose standard of sanity was to sacrifice manhood to party, to betray the Republic for spoils.

It was during this Congress that he created a sensation by antagonizing benevolence of representatives at government expense. A bill had been reported and was about to pass, appropriating a gratuity to a naval officer's widow. Crockett made an unanswerable argument on the unconstitutionality of this and other such appropriations, and closed by offering, with other friends of the widow, to give her a week of his salary as congressman. Not a member dared to answer or to vote for the bill, and not one followed Crockett's example of charity at his own expense.

But the independent, honest eccentric had reached the end of his public career. In the next congressional election he was beaten by tricks such as would not be tolerated at this time. One of these devices was to announce fictitiously a large number of public meetings in Crockett's name on the same day. When he failed to appear, as announced, speakers of the Jackson party, who would always arrange to be present, denounced Crockett as afraid to face his constituents upon his "treacherous and corrupt record in Congress." The defeat was a surprise to him; more, it almost broke his heart. He wrote, manfully, but pathetically, "I have suffered myself to be politically sacrificed to save my country from ruin and disgrace." I may add, like the man in the play, "Crockett's occupation 's gone."

Shortly after he made a farewell address to his constituents, into which he compressed a good deal of plain speaking, or as he says, "I put the ingredients in the cup pretty strong, I tell you: and I concluded by telling them that I was done with politics for the present, and that they might all go to hell and I would go to Texas."

"When I returned home," he adds, "I felt sort of cast down at the change that had taken place in my fortunes; sorrow, it is said, will make even an oyster feel poetical. Such was my state of feeling that I began to fancy myself inspired; so I took my pen in hand, and as usual, I went ahead." This is

CROCKETT'S FAREWELL TO HOME.

"Farewell to the mountains whose mazes to me
Were more beautiful far than Eden could be;
No fruit was forbidden, but Nature had spread
Her bountiful board, and her children were fed.
The hills were our garners—our herds wildly grew
And Nature was shepherd and husbandman too.
I felt like a monarch, yet thought like a man,
As I thanked the Great Giver, and worshiped his plan.

"The home I forsake where my offspring arose;
The graves I forsake where my children repose.
The home I redeemed from the savage and wild;
The home I have loved as a father his child;
The corn that I planted, the fields that I cleared,
The flocks that I raised, and the cabin I reared;
The wife of my bosom—Farewell to ye all!
In the land of the stranger I rise or I fall.

"Farewell to my country! I fought for thee well,
When the savage rushed forth like the demons from hell.
In peace or in war I have stood by thy side—
My country, for thee I have lived, would have died!
But I am cast off, my career now is run,
And I wander abroad like the prodigal son—
Where the wild savage roves, and the broad prairies spread,
The fallen—despised—will again go ahead."

We can not follow our hero—for he was a moral hero—in his adventures while going across the country to Texas. Only one

incident have we room for. On the way he rode apace with a circuit preacher, a man not less a hardy adventurer than himself. He narrates this:

"We talked about politics, religion, and nature, farming, and bear-hunting, and the many blessings that an all-bountiful Providence had bestowed upon our happy country. He continued to talk on this subject, traveling over the whole ground, as it were, until his imagination glowed, and his soul became full to overflowing; and he checked his horse, and I stopped mine also, and a stream of eloquence burst forth from his aged lips, such as I have seldom listened to: it came from the overflowing fountain of a pure and grateful heart. We were alone in the wilderness, but as he proceeded, it seemed to me as if the tall trees bent their tops to listen; that the mountain stream laughed out joyfully as it bounded on like some living thing; that the fading flowers of autumn smiled, and sent forth their fresher fragrance, as if conscious that they would revive in spring; and even the sterile rocks seemed to be endued with some mysterious influence. We were alone in the wilderness, but all things told me that God was there. The thought renewed my strength and courage. I had left my country, felt somewhat like an outcast, believed that I had been neglected and lost sight of. But I was now conscious that there was one watchful eye over me; no matter whether I dwelt in the populous cities, or threaded the pathless forests alone; no matter whether I stood in the high places among men, or made my solitary lair in the untrodden wild, that eye was still upon me. My very soul leaped joyfully at the thought. I never felt so grateful in all my life. I never loved my God so sincerely in all my life. I felt that I still had a friend.

"When the old man finished, I found that my eyes were wet with tears. I approached and pressed his hand, and thanked him, and says I, 'Now let us take a drink.' I set him the example, and he followed it, and in a style too that satisfied me, that if he had ever belonged to the temperance society, he had either renounced membership, or obtained a dispensation."

Crockett reached Texas just in time to take part with the American filibusters in the famous defense of the fortress of the Alamo, against Santa Anna's army. On the 6th of March, 1836, the citadel was carried by the Mexicans by assault, only six of the little garrison surviving, of whom Crockett was one. When captured he stood at bay in an angle of the fort, his shattered rifle in one hand and a bloody bowie-knife in the other; twenty Mexicans, dead or dying, were at his feet. His face was covered with blood flowing from a deep gash across his forehead. Santa Anna ordered the prisoners to be put to the sword. Crockett, hearing the order, though entirely unarmed, sprang like a tiger at the throat of the Mexican general, but a dozen swords interrupted him and cut off his life.

Thus in its prime was thrown away a life that in many respects was one of the most extraordinary in our annals. If he had enjoyed early advantages, he would have been one of the greatest of Americans. Nay, it is possible that if he had not been so deeply wounded by ingratitude, treachery and defeat, and had remained at home, he, instead of General Harrison, would have been the one to lead the popular revolution, when came the reaction from the unlicensed *regime* of Jackson and Van Buren.

David Crockett's courage, independence, honesty, goodness of heart, made him shine "like a good deed in a naughty world." He ought not to be forgotten by his countrymen, for a noble illustration of the capabilities that may be found among the common people, and of the career possible to even the lowliest-born American citizen.

WHEN a man is called feeble, what is meant by the expression? Feebleness denotes a relative state; a relative state of the being to whom it is applied. He whose strength exceeds his necessities, though an insect, a worm, is a strong being; he whose necessities exceed his strength, though an elephant, a lion, a conqueror, a hero, though a god, is a feeble being. *Rousseau.*

ETIQUETTE.

Etiquette is from the French word for ticket, and its present use in English suggests the old custom of distributing tickets or cards on which the ceremonies to be observed at any formal proceedings are fully set forth—a kind of program for important social gatherings of distinguished persons. Modern usage has given the word a much wider significance. It means the manners or deportment of cultured people; their bearing toward, or treatment of others.

The suggestions in a recent number of *THE CHAUTAUQUAN*, respecting "street etiquette," or things proper to be observed in riding, driving and walking, will not now be repeated, though many of our younger readers might profit by having, on so familiar a subject, "line upon line, precept upon precept."

The etiquette proper for the home and every-day life, in town and country, is quite as important, and embraces more things than there is space to notice.

CALLS AND CARDS.

Home, the dearest spot on earth, would be no fit abode for social beings if closed against the entrance and friendly offices of those without. The courtesies and kindness of neighbors must be received and reciprocated to make the home comforts complete. By simple methods the most important amicable relations in society are established and maintained.

Calls may be distinguished as ceremonious or friendly. The latter among intimate friends may, and ought to be quite informal, and for them no rules need be prescribed. Common-sense may be safely trusted, as to their manner, frequency, and the time spent in making them. But well-disposed, cultured people will usually have friendly relations with a much larger number than can be received on terms of close intimacy. As a means of establishing and maintaining such relations, mere formal calls are made. In the country and in small towns residents are expected to call on new-comers without having any previous acquaintance with them, or even having met them before. Ordinarily the new-comer, of whatever rank, should not call formally on a resident first, but wait till the other has taken the initiative. If after the first meeting, for any reason, the resident does not care to pursue the acquaintance, it will be discontinued by not leaving cards or calling again. The new-comer in like manner if not wishing to extend or continue the acquaintance, will politely return the first call, leaving cards only if the neighbors are not at home.

In some sections of the country calling on newcomers is done rather indiscriminately and with little regard to the real, or supposed social standing of the persons. This accords best with our American ideas of equality, and is consistent for those whose friendships are decided by character and personal accomplishments, rather than by the accidents of birth or wealth. The good society for which all may rightly aspire claims as among its brightest jewels some who financially rank with the lowly—rich only in the nobler qualities of mind and heart. The etiquette that, in any way, closes the door to exclude them is more nice than wise.

Those in high esteem in their community and most worthy will naturally, if circumstances permit, take the responsibility of first calls on strangers who come to reside among them. The call itself is a tender of friendship, and friendly offices, even though intimacy is not found practicable or desirable.

Custom does not require the residents of large cities to formally call on all new-comers in their neighborhood, which would be impracticable, only those quite near and having apparently about the same social status are entitled to this courtesy. Some discrimination is not only allowable but necessary.

A desirable acquaintance once formed, however initiated, is maintained by calls more or less frequent, as circumstances may decide, or by leaving cards when for either party that is more convenient.

Visiting cards must be left in person, not sent by mail or by

the hand of a servant, unless in exceptional cases. Distance, unfavorable weather or delicate health might be sufficient reasons for sending the cards, but, as a rule, ladies leave their cards themselves, this being found more acceptable.

A lady's visiting card should be plain, printed in clear type, with no ornamental or old English letters. The name printed on the middle of the card. The place of residence on the left-hand corner.

A married lady would never use her christian name on a card, but that of her husband after Mrs., before her surname.

In most places it is customary and considered in good taste for husbands and wives to have their names printed on the same card: "Mr. and Mrs.," but each would still need separate cards of their own.

The title "Honorable" is not used on cards. Other titles are, omitting the "The" preceding the title.

It is not in accordance with etiquette in most places for young ladies to have visiting cards of their own. Their names are printed beneath that of their mother, on her card, either "Miss" or "the Misses," as the case may be. If the mother is not living, the daughter's name would be printed beneath that of her father, or of her brother, in case of a brother and sister residing alone.

If a young lady is taken into society by a relative or friend, her name would properly be written in pencil under that of her friend.

If a lady making calls finds the mistress of the house "not at home" she will leave her card and also one of her husband's for each, the mistress and her husband; but if she have a card with her own and her husband's name on it, she leaves but one of his separate cards.

If a lady were merely leaving cards, and not intending to call she would hand the three cards to the person answering at the door, saying, "For Mrs. ———," without asking whether she is at home or not.

If a lady is sufficiently intimate to call, asks for and finds her friend at home, she should, on leaving the house, leave two of her husband's cards in a conspicuous place on the table in the hall. She should not drop them in the card-basket or hand them to the hostess, though she might silently hand them to the servant in the hall. She will on no account leave her own card, having seen the lady which removes all occasion for leaving her card.

If the lady were accompanied by her husband and the lady of the house at home, the husband would leave one of his own cards for the master of the house, but if he also is at home no cards are left. A lady leaves her card for a lady only, while a gentleman leaves his for both husband and wife.

A gentleman when calling takes his hat in his hand into the room and holds it until he has met the mistress of the house; he may then either place it on a chair or table near him, or hold it in his hand till he takes his leave.

DREAMS, books, are each a world : and books we know,
Are a substantial world, both pure and good ;
Round these, with tendrils strong as flesh and blood,
Our pastime and our happiness will grow.
There find I personal themes, a plenteous store,
Matter wherein right voluble I am,
To which I listen with a ready ear ;
Two shall be named, preëminently dear,—
The gentle lady married to the Moor ;
And heavenly Una, with her milk-white lamb.

Blessings be with them, and eternal praise,
Who gave us nobler loves and nobler cares—
The poets, who on earth have made us heirs
Of truth and pure delight by heavenly lays !
Oh ! might my name be numbered among theirs,
Then gladly would I end my mortal days.

—Wordsworth's "Personal Talk."

NAPOLEON'S MARSHALS.

Napoleon's marshals were twenty-six in number, of whom seven only were born in a rank which would have entitled them to become general officers under the old Monarchy. These were Kellermann, Berthier, Davoust, Macdonald, Marmont, Grouchy, and Poniatowski, a Pole. Of the others, Murat was the son of an innkeeper, Lefèbvre of a miller, Augereau of a mason, Bernadotte of a weaver, and Ney of a cooper. Masséna's father, like Murat's, kept a village wine-shop: Lannes was the son of an ostler, and was himself apprenticed to a dyer; Victor, whose real name was Perrin, was the son of an invalided private soldier, who after leaving the service became a market-crier; while Soult's mother kept a mercer's shop, and Oudinot's a small *café* with a circulating library. The marshals sprung from the *bourgeoisie* or middle class were Serrurier, whose father was an officer, but never rose above the rank of captain; Bessières, whose father, though a poor clerk in a lawyer's office, was the son of a doctor; Suchet, who was the son of a silk-merchant; Moncey, the son of a barrister; Gouvion, who assumed the name of Saint-Cyr, and whose father practiced as an attorney; and Brune, who started in life as a journalist. It is curious to trace through the lives of the different men the effect which their earliest associations had upon them. Some grew ashamed of their parentage; whilst others bragged overmuch of being self-made men. Only one or two bore their honors with perfect modesty and tact.

The noblest character among Napoleon's marshals was beyond doubt Adrien Moncey, Duc de Conéglano. He was born at Besançon in 1754, and enlisted at the age of fifteen, simply that he might not be a charge to his parents. From his father, the barrister, he had picked up a smattering of education, while Nature had given him a talent for drawing. He looked so small and young when he was brought before the colonel of the Franche Comté regiment for enrollment, that the latter, who was quite a young man—the Count de Survilliers—asked him, laughing, whether he had been tipsy from “drinking too much milk” when he fell into the hands of the recruiting sergeant. The sergeant, by way of proving that young Moncey had been quite sober when he had put on the white cockade (which was like taking the king's shilling in England), produced a cleverly executed caricature of himself which the boy had drawn; upon which M. de Survilliers predicted that so accomplished a recruit would quickly win an epaulette. This promise came to nothing, for in 1789, after twenty years' service, Moncey was only a lieutenant. It was a noble trait in him that in after years he never spoke resentfully of his slow promotion. He used to say that he had been thoroughly well-trained, and he alluded kindly to all his former officers. After Napoleon's overthrow, Moncey's conduct was most chivalrous; he privately blamed Ney's betrayal of the Bourbons, for it was not in his nature to approve of double-dealing, but he refused to sit in judgment upon his former comrade. Marshal Victor was sent to shake his resolution, but Moncey repeated two or three times: “I do not think I should have acted as Ney did, but I believe he acted according to his conscience and did well; ordinary rules do not apply to this case.” He eventually became governor of the Invalides, and it fell to him in 1840 to receive Napoleon's body when it was brought from St. Helena. It was remarked at the time that if Napoleon himself could have designated the man who was to discharge this pious duty, he would have chosen none other than Moncey, or Oudinot, who by a happy coincidence became governor of the Invalides in 1842 after Moncey's death.

Nicolas Oudinot, Duc de Reggio, was surnamed the Modern Bayard. He was born in 1767, and like Moncey enlisted in his sixteenth year. He was wounded thirty-two times in action, but was so little of a braggart that in going among the old pensioners of the Invalides he was never heard to allude to his own cars. At Friedland a bullet went through both his cheeks,

breaking two molars. “These Russians do not know how to draw teeth,” was his only remark, as his wound was being dressed.

After Friedland he received with the title of count a grant of £40,000, and he began to distribute money at such a rate among his poor relations, that the emperor remonstrated with him. “You keep the lead for yourself, and you give the gold away,” said His Majesty in allusion to two bullets which remained in the marshal's body.

Macdonald comes next among the marshals for nobility of character. He was of Irish extraction, born at Sancerre in 1765, and served under Louis XVI. in Dillon's Irish Regiment. Macdonald won his colonelcy at Jemmapes. In 1804, however, all his prospects were suddenly marred through his generous espousal of Moreau's cause. Moreau had been banished on an ill-proven charge of conspiracy; and Macdonald thought, like most honest men, that he had been very badly treated.

But by saying aloud what most honest men were afraid even to whisper, Macdonald incurred the Corsican's vindictive hatred, and during five years he was kept in disgrace, being deprived of his command, and debarred from active service. He thus missed the campaigns of Austerlitz and Jéna, and this was a bitter chagrin to him. He retired to a small country-house near Brunoy, and one of his favorite occupations was gardening. He was much interested in the projects for manufacturing sugar out of beetroot, which were to render France independent of West India sugar—a matter of great consequence after the destruction of France's naval power at Trafalgar: and he had an intelligent gardener who helped him in his not very successful efforts to raise fine beetroots. This man turned out to be a police-spy. Napoleon in his jealousy of Moreau and hatred of all who sympathized with the latter, had thought it good to have Macdonald watched, and he appears to have suspected at one time that the hero of Otricoli contemplated taking service in the English army. There were other marshals besides Macdonald who had reasons to complain of Napoleon; Victor's hatred of him was very lively, and arose out of a practical joke. Victor was the vainest of men; he had entered Louis XVI.'s service at fifteen as a drummer, but when he became an officer under the Republic he was weak enough to be ashamed of his humble origin and assumed his Christian name of Victor as a surname instead of his patronymic of Perrin. He might have pleaded, to be sure, that Victor was a name of happy augury to a soldier, but he does not appear to have behaved well toward his Perrin connections. He was a little man with a waist like a pumpkin, and a round, rosy, jolly face, which had caused him to be nicknamed *Beau Soleil*. A temperate fondness for red wine added occasionally to the luster of his complexion. He was not a general of the first order, but brave and faithful in carrying out his master's plans; he had an honorable share in the victory of Friedland, and after this battle was promoted to the marshalate and to a dukedom. Now Victor would have liked to be made Duke of Marengo; but Napoleon's sister Pauline suggested that his services in the two Italian wars could be commemorated as well by the title of Belluno—pronounced in French, Bellune. It was not until after Napoleon had innocently acceded to this suggestion that he learned his facetious sister had in choosing the title of Bellune (Belle Lune) played upon the sobriquet of Beau Soleil. He was at first highly displeased at this, but Victor himself took the joke so very badly that the emperor ended by joining in the laughter, and said that if the marshal did not like the title that had been given him, he should have no other. Wounds in vanity seldom heal, and Victor, as soon as he could safely exhibit his resentment, showed himself one of Napoleon's bitterest enemies. During the Hundred Days he accompanied Louis XVIII. to Ghent, and he figured in full uniform at the *Te Deum* celebrated in the Cathedral of Saint Bavon in honor of Waterloo.

Augereau, Duc de Castiglione, was of all the marshals the one in whom there is least to admire; yet he was for a time the

most popular among them, having been born in Paris and possessing the devil-may-care impudence of Parisians. He was the son of a mason and of a street fruit-vendor, and he began life as apprentice to his father's trade. Soon after he enlisted, and proved a capital soldier; but his character was only good in the military sense. He was thirty-two when the Revolution broke out, and was then wearing a sergeant's stripes; in the following year he got a commission; in 1793 he was a colonel; in 1795 a general. His rapid promotion was not won by valor only, but by sending to the war office bombastic despatches in which he magnified every achievement of his twenty-fold, and related it with a rigmarole of patriotic sentiments and compliments to the convention.

There was one great point of resemblance between Augereau and Masséna: they were both inveterate looters. In 1798, when Masséna was sent to Rome to establish a republic, his own soldiers were disgusted by the shameless way in which he plundered palaces and churches, and he actually had to resign his command owing to their murmurs. Augereau was a more wily spoiler, for he gave his men a good share of what he took, and kept another share for Parisian museums, but he always reserved enough for himself to make his soldiering a very profitable business.

It was politic of Napoleon to make of Augereau a marshal-duc, for apart from the man's intrepidity, which was unquestionable (though he was a poor general), the honors conferred upon him were a compliment to the whole class of Parisian *ouvriers*. Augereau's mother, the costerwoman, lived to see him in all his glory, and he was good to her, for once, at a state pageant, when he was wearing the plumed hat of a senator, and the purple velvet mantle with its *semis* of golden bees, he gave her his arm in public. This incident delighted all the market-women of Paris, and helped to make Napoleon's court popular; but in general respects Augereau proved an unprofitable, ungrateful servant. He was one of the first marshals to grumble against his master's repeated campaigns, and he deserted him in 1814 under circumstances which looked suspicious. Napoleon accused him of letting himself be purposely beaten by the Allies. After the escape from Elba, Augereau first pronounced himself vehemently against the "usurper;" then proffered him his services, which were contemptuously spurned. The Duc de Castiglione's career ended then, for he retired to his estate at Houssaye, and died a year afterward, little regretted by anybody.

Masséna, who had been born the year after Augereau, died the year after him, in 1817. He too had enlisted very young, but finding he could get no promotion, had asked his friends to buy his discharge, and during the five years that preceded the Revolution, he served as potman in his father's tavern at Leven. Re-enlisting in 1789, he became a general in less than four years. After Rivoli, Bonaparte dubbed him "The darling of victory;" but it was a curious feature in Masséna that his talents only came out on the battle-field. Usually he was a dull dog, with no faculty for expressing his ideas, and he wore a morose look. Napoleon said that "the noise of cannon cleared his mind," endowing him with penetration and gaiety at the same time. The din of war had just the contrary effect upon Brune, who, but for his tragic death, would have remained the most obscure of the marshals, though he is conspicuous from being almost the only one of the twenty-six who had no title of nobility. Brune was a notable example of what strong will-power can do to conquer innate nervousness. He was the son of a barrister, and having imbibed the hottest revolutionary principles, vapored them off by turning journalist. He went to Paris, and was introduced to Danton, for whom he conceived an enthusiastic admiration. He became the demagogue's disciple, letter-writer, and boon companion, and it is pretty certain that he would eventually have kept him company on the guillotine, had it not been for a lucky sneer from a woman's lips which drove him into the army. Brune had written a pamphlet on military

operations, and it was being talked of at Danton's table, when Mdle. Gerfault, an actress of the Palais Royal, better known as "Eglé," said mockingly, "You will be a general when we fight with pens." Stung to the quick, Brune applied for a commission, was sent into the army with the rank of major, and in about a year, through Danton's patronage, became a brigade-general; meanwhile poor Eglé, having wagged her pert tongue at Robespierre, lost her head in consequence.

The marshal on whom ducal honors seemed to sit most queerly was François Lefèvre, Duc de Dantzig. He was born in 1755, the son of a miller, and was a sergeant in the French guards at the time of the Revolution. He had then just married a *vivandière*. The anecdotes of Madame Lefèvre's incongruous sayings at the consular and imperial courts are so many as to remind one of the proverb, "We yield only to riches." Everything that could be imagined in the way of a *lapsus lingua* or a bull was attributed to this good-natured Mrs. Malaprop, whose oddities amused Josephine, but not always Napoleon.

Once Lefèvre fell ill of ague, and his servant, an old soldier, caught the malady at the same time. The servant was quickly cured; but the fever clung to the marshal until it occurred to his energetic duchess that the doctor had blundered by giving to a marshal the same doses as to a private soldier. She rapidly counted on her fingers the different rungs of the military ladder. "Here, drink, this suits your rank," she said, putting a full tumbler to her husband's lips, and the duke having swallowed a dozen doses at one gulp, was soon on his legs again. "You have much to learn, my friend," was the lady's subsequent remark to the astonished doctor.

Napoleon was a great stickler for appearances, and for this reason loathed the dirtiness and slovenliness of Davoust. Madame Junot, in her amusing "Memoirs," relates that the Duc d'Auerstadt, having some facial resemblance to Napoleon, was fond of copying him in dress and manners; but she adds that Napoleon himself was very neat. A marshal had no excuse for being untidy. Davoust had been at Brienne with Bonaparte, and had thus a longer experience of his master's character than any of the other marshals. Had he been wise he would have turned it to account, not only by cultivating the graces, but by giving the emperor that ungrudging, demonstrative loyalty which Napoleon valued above all things, and rewarded by constant favor. But Davoust was a caballer, a grievance-monger, and a *grognard*; and it must have been rather diverting to see him aping the manners of a master at whom he was always carping in holes and corners. On the other hand, it must be said that Davoust proved faithful in the hour of misfortune, and did not rally to the Bourbons till 1818; that is, when all chances of an imperial restoration were gone; moreover, every time he held an important command he did his duty with courage, talent, and fidelity. His affected brusqueness of speech was an unfortunate mannerism, for it made him many enemies, and sometimes exposed him to odd reprisals. The roughness of tongue which was affected in Davoust was natural in Soult. This marshal had an excellent heart, but he could not, for the life of him, refrain from snarling at anybody whom he heard praised. The proverb about bite and bark might have been invented for him, as the men at whom he grumbled most were often those whom he most favored.

Soult was born in the same year as Napoleon, 1769, and outlived all his brother marshals, dying in 1852, when the second empire was already an impending fact. He had been a private soldier under Louis XVI., he passed through every grade in the service, he became prime minister, and when he voluntarily resigned office in 1847, owing to the infirmities of age, Louis Philippe created him marshal-general—a title which had only been borne by three marshals before him, Turenne, Villars, and Maurice de Saxe. But these honors never quite consoled Soult for having failed to become king of Portugal. He could not stomach the luck of his comrade Bernadotte, the son of a weaver, who was wearing the crown of Sweden.

Bernadotte, whom Soult envied, has some affinities with M. Grévy. This president of the republic first won renown by a parliamentary motion to the effect that a republic did not want a president; so Bernadotte came to be a king, after a long and steadfast profession of republican principles. Born in 1764, he enlisted at eighteen, and was sergeant-major in 1789. He was very nearly court-martialed at that time for haranguing a crowd in revolutionary terms. Five years later he was a general, and in 1798 ambassador at Vienna. He was an able, thoughtful, hardy, handsome man, who, having received no education as a boy, made up for it by diligent study in after years; and no man ever so well corrected, in small or great things, the imperfections of early training. Tallyrand said of him, "He is a man who learns and *unlearns* every day." One thing he learned was to read the character of Napoleon and not to be afraid of him, for the act which led to his becoming king of Sweden was one of rare audacity. Commanding an army sent against the Swedes in 1808, he suspended operations on learning the overthrow by revolution of Gustavus IV., against whom war had been declared. The Swedes were profoundly grateful for this, and Napoleon dared not say much, because he was supposed to have no quarrel with the Swedes as a people; but Bernadotte was marked down in his bad books from that day, and he was in complete disgrace when in 1810 Charles XIII. adopted him as crown prince with the approval of the Swedish people. Bernadotte made an excellent king, but remembering his austere advocacy of republicanism, it is impossible not to smile and ask whether there is not some truth in Madame de Girardin's definition of equality as *le privilège pour tous*.

Napoleon always valued Kellerman as having been a general in the old royal army. Born in 1735, he was a *maréchal de camp* (brigadier) when the war broke out. The emperor would have been glad to have had more of such men at his court; but it was creditable to the king's general officers that very few of them forgot their duties as soldiers during the troublous period when so many temptations to commit treason beset men holding high command. Grouchy, who in 1789 was a lieutenant in the king's body-guard, hardly cuts a fine figure as a revolutionist accepting a generalship in 1793 from the convention which had beheaded his king. He was an uncanny person altogether; the convention having voted that all noblemen should be debarred from commissions, he enlisted as a private soldier, and this was imputed to him as an act of patriotism; but he had friends in high quarters who promised that he should quickly regain his rank if he formally renounced his titles; and this he did, getting his generalship restored in consequence. In after years he resumed his marquissate, and denied that he had ever abjured it. Napoleon created him marshal during the Hundred Days for having taken the Duc d'Angoulême prisoner; but the Bourbons declined to recognize his title to the *bâton*, and he had to wait till Louis Philippe's reign before it was confirmed to him. Grouchy was never a popular marshal, though he fought well in 1814 in the campaign of France. His inaction on the day of Waterloo has been satisfactorily explained, but somehow all his acts have required explanation; he was one of those men whose records are never intelligible without footnotes.

But how many of the marshals remained faithful to their master when his sun had set? At St. Helena Napoleon alluded most often to Lannes and Bessières, who both died whilst he was in the heyday of his power, the first at Essling, the second at Lützen. As to these two Napoleon could cherish illusions, and he loved to think that Lannes especially—his brave, hot-headed, hot-hearted "Jean-Jean"—would have clung to him like a brother in misfortune. Perhaps it was as well that Lannes was spared an ordeal to which Murat, hot-headed and hot-hearted too, succumbed. It is at all events a bitter subject for reflection that the great emperor found among his marshals and dukes no such friend as he had among the hundreds of humbler officers, captains, and lieutenants, who threw up their commissions sooner than serve the Bourbons.—*Temple Bar*.

C. L. S. C. WORK.

By REV. J. H. VINCENT, D.D., SUPERINTENDENT OF INSTRUCTION C. L. S. C.

The Class of '84 rules the year.

The readings for November are: "History of Greece," Timayenis, volume II, parts 10 and 11, or (for the new Class of 1877) "Brief History of Greece;" Chautauqua Text-Book No. 5, "Greek History;" Required Readings in THE CHAUTAUQUAN.

Memorial Day for November, Special Sunday, November 11. Read Job, twenty-eighth chapter. One of the finest passages in all literature.

Talk much about the subject of your reading. You know what you have by your speech caused others to know.

Have you ever tried to control conversation at a table in the interest of some sensible subject? It will be a curious study for you to see how this mind and that will run away with or from the topic you have proposed. It will tax your ingenuity to bring the company back to the original topic. The measures of your success will be the interest you can awaken in others, the amount of information on the subject which you can elicit from them, and the amount, also, which you can give them without seeming to be a lecturer or preacher for the occasion.

We must insist upon the observance of the Memorial Days. Put up your list of Memorial Days in plain sight, so that you may not forget them. Order a copy of the little volume of "Memorial Days" from Phillips & Hunt, 805 Broadway, New York, or Walden & Stowe, Cincinnati, Ohio. Price, 10 cents.

It is proposed that "the C. L. S. C. as a body organize a lecture bureau, to be entirely or partially sustained by small contributions from each member, thereby enabling weak circles to obtain one or two good lectures during the year at reasonable prices." A proposition to be considered.

"Will I be required to read the 'Preparatory Latin Course in English' next year? I have studied the same thing in the original very lately." Answer: You will be required to read the "Preparatory Latin Course in English." You can not have studied, except under such a teacher as Dr. Wilkinson, the Latin Course in English as we require it under the C. L. S. C. The book must be read.

"Does the C. L. S. C. confer a degree? If so, what is it?" Answer: The C. L. S. C. is not a university or college. It has no charter, consequently it has no power to confer degrees. There is a university charter in the hands of the Chautauqua management—a university to be. In this university there will be non-resident courses of study, with a rigid annual examination, to be followed by degrees and diplomas. There may sometime in the future be a permanent Chautauqua University at Chautauqua. Further than this I can say nothing now. It is to be hoped the Chautauqua University will never confer honorary degrees.

Correspond with some one on the studies of the C. L. S. C. Make your letter a means of self-improvement. Congratulate yourself if your friend, in reply, shows where you made two or three mistakes in your letter.

Will you find out the names of the latest graduating class of the high school in your town, and send them to me? I may interest them in the C. L. S. C. course of study, by sending a "Popular Education Circular." Address Drawer 75, New Haven, Conn.

Are you willing wisely to distribute from ten to a hundred copies of the "Popular Education Circular," and would you

scatter copies of the tiny C. L. S. C. advertisement, if they were sent you?

The most indefatigable worker in the C. L. S. C., next to our worthy secretary, Miss Kimball, is the secretary of the new class—the Class of 1887—Mr. Kingsley A. Burnell, who is making a remarkable record as he travels to and fro in the far West, visiting editors of papers, offices of railroad superintendents, cabins of employes, and on the cars, urging persons to adopt this new plan of self-culture.

C. L. S. C. STATIONERY.

A promise was made at the Round-Table at Chautauqua that in THE CHAUTAUQUAN for November there should be something said about all kinds of C. L. S. C. stationery known to the writer.

William Briggs, 80 King St., E., Toronto, Ont., sells several styles of stationery, sheets and envelopes, with a monogram printed in blue, mauve, or crimson. Information can be obtained by addressing him at Toronto.

By the time this number has reached the hands of its readers, or within a few days after, there will be for sale at the various book stores dealing in the "Required Reading" of the C. L. S. C. a variety of *papeterie* stationery, having on the front page a beautiful design most artistically engraved, showing Chautauqua Lake, with the Chautauqua landing on the right, as seen from the railroad station, and in the upper left hand corner an oval, or circle, with the Hall of Philosophy very tastily enshrined therein. In the foliage drooping into the lake there is inwrought the monogram of the C. L. S. C. A box of this very fine paper and envelopes will cost about fifty cents. It will be sent by mail from Messrs. Fairbanks, Palmer & Co., 133 Wabash Avenue, Chicago, Ill., or from J. P. Magee, 38 Bromfield St., Boston, Mass., or from H. H. Otis, Buffalo, N. Y. An advertisement of this stationery will be found in the December number of THE CHAUTAUQUAN.

Another style of stationery can be had of Messrs. Fairbanks, Palmer & Co., for the class of 1884, with a beautiful design especially arranged for that class. Forty cents for a quire of paper and envelopes to match.

Ten thousand sheets prepared for general use by the members and officers of the several classes, specially designed to be used by gentlemen, can be had by addressing the several class officers.

For further information write to Rev. W. D. Bridge, 718 State St., New Haven, Conn.

NEW ENGLAND BRANCH OF THE CLASS OF '86.

While at Lake View a New England Branch of the Class of '86 was organized, with the following officers: President, Rev. B. T. Snow, Biddeford, Me.; vice-presidents, Rev. W. H. Clark, South Norridgewock, Me., Edwin F. Reeves, Laconia, N. H., Rev. J. H. Babbitt, Swanton, Vt., Charles Wainwright, Lawrence, Mass., Miss Lousta E. French, Newport, R. I., Rev. A. Gardner, Buckingham, Ct.; secretary and treasurer, Mary R. Hinckley, Bedford, Mass. The above officers were authorized to act also as an executive board.

The badge of Class of '86 can be obtained of the President. It has been decided to use in private correspondence a certain style of letter paper marked, with "C. L. S. C. '86" in a neat monogram. Further particulars in regard to this paper will soon be given.

Just before leaving Chautauqua the Class of '86 adopted a motto: "We study for light, to bless with light." The New England branch adopts this motto, in addition to the one chosen at Lake View; "Let us keep our Heavenly Father in the midst."

C. L. S. C. TESTIMONY.

Canada.—It was a bitter disappointment to me that I was compelled to leave school at fourteen and earn my own living, giving up the idea of a college course. The C. L. S. C. has been to me therefore an unspeakable boon.

Vermont.—I have received large benefit as well as pleasure during the year that I have been a member of the C. L. S. C. The course of reading has taken me into broader fields, opened new avenues of thought and reflection, widened my field of vision, and altogether made me a better man.

Vermont.—According to Isaiah xxx: 7, I have been trying to show my strength by "sitting still" four years. I often ask myself, what should I have done had I not had this interesting course—the C. L. S. C. During these four years of deprivation how many sorrows have been almost forgotten while reading the many interesting thoughts that are presented in our reading. I thank God many times for this glorious enterprise.

Connecticut.—I have been very much interested in the studies of the C. L. S. C. during the first year. It is an honor as well as a privilege to be a member.

Rhode Island.—Many times home duties have occupied time and thought so fully as to discourage me. But realizing that I am to live "heartily as to the Lord;" and viewing the course as his special blessing, I have gathered inspiration and journeyed on patiently.

New York.—I have enjoyed my four years' course very much, and hope that it has been profitable to me. Though having reached the age of sixty years my love for improvement has not been gratified, and I purpose to continue the course that is marked out.

New York.—I am surprised at the pleasure and advantage the C. L. S. C. has been to me. I have read no more than usual, but have read more systematically, and received greater benefit. There is inspiration in being "one of many."

New York.—I have taken great pleasure in the reading. Am very enthusiastic over the course, and will try my best to graduate. I do it a great deal for my children, hoping that I may be a better mother, and train their minds so that they will make better men and women than they would have been had I not become a member of the C. L. S. C. Am all alone in my reading, except what my boy of fourteen does with me; even my little girl just turned seven studies geology with me, and is much interested in finding specimens.

Pennsylvania.—I have only been a member of the C. L. S. C. for about four months and in that time I have done most of my reading at night, reading usually from eight o'clock until eleven. As I have to work hard all day, I have little time for reading except at night. I find the course very interesting, and I am deriving a great amount of good from it.

Pennsylvania.—For almost two years my work has required my presence twelve hours every week day, and part of the time sixteen and eighteen hours. I gave up last summer, thinking I could not finish the course, but after being present at Chautauqua I had a greater desire than ever to continue. I have at leisure moments read up for the two years, and must ever feel grateful to Chautauqua influence.

Ohio.—I am a farmer's wife, but with all the care of the work that position in life brings (and a good share of the work too), I still find time to read the regular four years' course of the C. L. S. C., and desire to do as thorough work as I am capable of doing. Am reading not merely for pleasure, far less to criticise,

but for *instruction*, and have been greatly helped by this first year's study.

Ohio.—In many ways I think the C. L. S. C. has been of benefit to the little ones. This last winter my eldest daughter said: "Why can't we have a society of our own?" "We," meant the family. I seconded it gladly, and my husband also, and we resolved ourselves into the "Clio Clique" and took as our work "Art and Artists," as mapped out in the *St. Nicholas*. Each member pledged themselves to take the work given them by the president (who was our only officer), and also to commit not less than eight lines of some poem to memory. We had no outside members, and we did our work right well, I think.

Illinois.—The C. L. S. C. has done much for me. Life has been brighter, sweeter and better than it might otherwise have been. Friendships have been formed which I am sure will survive life, and add another link in the golden chain that binds us to another world.

Michigan.—To the C. L. S. C. I owe everything.

Michigan.—Were it not that I still may keep a place in the Circle, I should be sorry the four years were over. They have been pleasant ones, so far as the Circle was concerned, and have passed swiftly. It seemed a great undertaking to me four years ago, when I commenced the course. For one thing, I did not see my way clear to get the books, but I resolved to try, and it has seemed all along that it was God's way of helping me to the knowledge I had so much desired.

Wisconsin.—A lady writes: The regular methods of the C. L. S. C. have suggested to me the plan of having a little home monthly, contributed to only by members of the family, written, and read aloud on a specified evening each month. The children write prose and poetry that are a surprise, but only the effect of a regular course of reading and conversations by one member of the family. While reading astronomy, one of the little girls, aged ten years, took two looking-glasses and illustrated, in play, the motions of a planet. She held them by the window in the sun, so as to throw the reflection on the ceiling. One she had stationary, for the sun, the other she caused to go around it, causing the motion to hasten at perihelion, and to become slow at aphelion, describing the motions correctly. Then she imagined a comet, causing it to go out of sight, then return, and upon its approach to the sun rushing it past with lightning speed. I called the attention of their father to their play with much delight, for I had no idea they understood the motions so well, simply from conversations on the subject in the family circle. They all joined in the conversation at play, and seemed to comprehend it all.

Iowa.—The studies have benefited me much more than I can express in words. May heaven's choicest blessings rest upon the officers and everyone connected with the C. L. S. C.

Kansas.—I am one of the busy housekeepers, but always find time to read. My reading has uplifted my soul, and led me to a fuller appreciation of the power and love of God, and I feel thankful that I am numbered with the army of Chautauquans.

California.—When I read the C. L. S. C. testimony in THE CHAUTAUQUAN, I always think Chautauqua has been *all that and more* to me, for it has led me from cold, dark skepticism to my Bible and my Father in heaven, and it is gradually leading some of my friends into the light. I prize my C. L. S. C. books more highly than they are worn and soiled by many readers, and I believe I can do no better missionary work than by enlarging the Circle.

C. L. S. C. REUNION.

On the afternoon of June 27, at Pendleton, Indiana, a delightful C. L. S. C. reunion was held. The circle of Pendleton invited the circle from the neighboring village of Greenfield to join with them in their last meeting for the year. A goodly number of visitors were present. After an entertaining program of speeches, songs, toasts, etc., had been carried out, the following class histories were read:

PENDLETON LOCAL CIRCLE.

On the evening of the 28th of December, 1881, a little company of eight ladies and five gentlemen assembled at the home of Dr. Huston, Pendleton, Indiana, for the purpose of more fully discussing the Chautauqua Idea, and if possible to organize a branch of the great Chautauqua Literary and Scientific Circle. Three months behind in the year's studies, the outlook was not as encouraging as could have been wished, but finding one of the class mottoes to be "Never be discouraged," it was unanimously agreed that we organize. Teachers were also chosen for the principal studies, and it was thought best that they should present the lessons to the class in the form of questions. This method was generally observed throughout the year, with the exception of some lectures on geology. At each session two of the members were appointed to write papers for the following week, on some subject pertaining to the lessons. Longfellow's birthday was the only memorial observed. Besides the usual exercises of the evening a short sketch of the life of the poet was read, followed by the reading of two of his poems. Our weekly meetings were well kept up, and much interest manifested in the studies until the first of May, when owing to summer heat, and many calls on the time of the different members, it was thought best to meet once a month, each member being given a portion of the studies to be brought forward at the next session. This plan was found to be a good one for the summer months, and was continued until the beginning of the new year's studies, when the weekly meetings were again resumed, and the meetings were spent in much the same manner as the first year with the exception of the evening of the thirtieth of November, when a complete change was made in the program, by having a C. L. S. C. thanksgiving supper and a general good time at the residence of Mr. and Mrs. Whitney. Since that time our circle has lost several of its members either from sickness or change of residence, but we hope ere the beginning of another year to be fully reinforced and ready to continue the good work.

GREENFIELD LOCAL CIRCLE.

Although we have met to-day as strangers, we find that the unity of thought and purpose that has characterized our work the past year has made us friends. The history of our circle is necessarily brief because of the short time it has been in existence. When we first organized in the fall of '82, a part of us supposed we were entering the society temporarily and did not expect to matriculate and become regular members of the mystic tie, but we only met a few times till we perceived the advantages we were deriving from the association, one with another, and saw the necessity of a permanent organization. Now there are ten of us enrolled as students of the "University of the C. L. S. C." We pursued the course with a great deal of enthusiasm and delight, and if it were possible, each study seemed more interesting than the preceding. With a great deal of reluctance we laid aside geology and Greek history for astronomy and English history, but we soon saw we were susceptible of inspiration from the latter as well as the former. Our circle, except two, is composed of married ladies. As housewives we feel that the course has been very beneficial—it has relieved the monotony and tedium of housekeeping because it has given us something ennobling to think of—it has also given us a taste for something else than the last novel and the latest piece of gossip in the daily papers. We feel as though we could adopt the sentiment of Plato. A friend who observed that he seemed as desirous to learn himself as to teach others, asked him how long he expected to remain a student? Plato replied, "As long as I am not ashamed to grow wiser and better."

TEMPERANCE and labor are the two best physicians of man; labor sharpens the appetite, and temperance prevents him from indulging to excess.—*Rousseau*.

LOCAL CIRCLES.

Province of Quebec (Bedford).—The Harmony Circle was organized here last September. We are seven in number, all having so many cares that the Chautauqua work has to be done by improving the spare moments, and often by giving up some pleasure or recreation; but the sacrifice is made willingly. Each member prepares seven questions; the number to be chosen from each subject in hand is determined at the previous meeting. Each in turn puts a question to his or her nearest neighbor, then the second time round to the nearest but one, and so on; thus each member puts a question to every other member. This, with discussions and conversations which arise from the lesson, occupies more than two hours in a very enjoyable manner. We have derived profit from the work, both in increase of knowledge and improvement of literary taste. Our circle has also been the source of much kindly feeling and mutual interest, and a strong bond of friendship amongst us.

Maine (Brownfield).—Our circle was organized early in October, 1882, with ten regular members, five gentlemen and five ladies. We arranged to meet once in two weeks, and enjoyed our evenings together so much that it was extremely difficult to keep the length of our sessions within reasonable bounds. We congratulated ourselves constantly on the pleasure afforded us by our studies, and on the obvious improvement, from month to month, in the work of individual members. It was decided, for the present year at least, to change the whole board of officers once in three months, that the educating influences of the responsibilities connected with the various offices might be shared, in turn, by all who were willing to accept them.

Maine (Fairfield).—A local circle was organized here in October, 1882, and now numbers fifteen members, nearly all of whom have completed the required readings to date. Teachers are assigned to each of the subjects as they are taken up, and recitations are conducted with excellent system and thoroughness. In addition to this we have numerous essays and readings, and the enthusiasm is such that, notwithstanding our regular meetings occur fortnightly, we have many special meetings. It is the custom at all of our meetings to criticize freely, and this leads to an exactness of pronunciation when reading, not otherwise to be attained.

Maine (Brownfield).—Our circle meets once in two weeks, takes up questions in THE CHAUTAUQUAN, and then devotes a short time to questions of our own asking, using a question-box. We think this an excellent plan. After this we generally have short essays on the subjects we are reading, often closing with general conversation.

Massachusetts (Wareham).—The Pallas Circle closed for the season with a lawn party, June 18.

PROGRAM.

Singing—"A Song of To-day."

Roll-Call—Responses of quotations from any of the reading of the past year.

Secretary's report.

Selected questions in Astronomy, answered by members of the circle.

Reading—"The Vision of Mirza."

Essay—"The Mythological Story of Ursa Major and Ursa Minor."

Reading—Selections from "Evangeline."

Reading—"The Fan-drill."—(Addison.)

Singing—Chautauqua Carols.

Supper—Toasts and Responses, including two original poems.

Though small in numbers the circle is very enthusiastic in its work. New members for the coming year were enrolled from the invited guests of the occasion, and the readings will be commenced in October with fresh vigor.

Massachusetts (Haverhill).—A local circle was organized in Haverhill, March 14, 1883, with the following officers: R. D. Trask, president; George H. Foster, vice president; Delia Drew, secretary. Whole membership numbers seventeen.

Massachusetts (Natick).—The Natick local circle was organized September 20, 1879. Eight of the original members, keeping in view the motto, "never be discouraged," have completed the four years' course. At the commencement of the present year our local circle numbered twenty-five. We enjoy our reading greatly, and consider the Natick C. L. S. C. a success.

Connecticut (West Haven).—Our circle was organized November 14, 1881, and numbers seventeen members. We meet once a week. Our circle is divided into committees of three and four to arrange programs for the month's entertainments. They include reviews, essays on different subjects connected with the course, readings and recitations. "Shakspeare's Day" was observed by reading a portion of the play, "Merchant of Venice," the committee having previously assigned the different characters to the members present. We are very social at our meetings, and occasionally have a little collation at the close of the exercises. Most of us are well up with the class, and find the Chautauqua evenings not only instructive, but exceedingly enjoyable.

New York (Angola).—A local circle was organized here February 5, 1883, and consists of eighteen members. We usually do the reading in THE CHAUTAUQUAN at our meetings, information being given, and questions asked by all. We have made use of the questions and answers in THE CHAUTAUQUAN, and found them to be of much assistance. Occasionally topics are assigned, upon which we are to read or speak at the next meeting. Criticism upon pronunciation is unsparingly given to all. We intend to continue our meetings, and hope that another year may bring us a larger membership.

Pennsylvania (Allegheny City).—In November, 1882, the Woodlawn segment of the C. L. S. C. was organized and officers elected. The president having drawn up a constitution, it was read and unanimously adopted. Our constitution regulates the manner of conducting the society, prescribes parliamentary rules, etc. During our study of geology, we were favored with an interesting and instructive lecture by A. M. Martin, Esq., General Secretary of the C. L. S. C. Our membership now consists of seventeen persons, six being ladies.

Pennsylvania (Gillmor).—Our circle owes its being to the earnest, persistent efforts of two or three persons who had read one year alone. The first meeting was held October 24, 1882, and the circle organized with fifteen members. We labor under some peculiar difficulties. Our members represent several little villages, and are so scattered that it is some times hard to get together. Then we are in the oil country where people stay rather than live, so they gather around them only such things as are needful for comfortable living. The majority have but few books of reference, or other helps to study. Our meetings were opened with prayer and the singing of a Chautauqua song, and sometimes repeating the Chautauqua mottoes, any items of business being attended to before beginning the regular work of the circle: Before closing members were appointed by the president to conduct the various exercises in the succeeding meeting. In the latter part of the winter the president proposed a course of lectures. It was a decided success. Our lecturers were J. T. Edwards, D.D., Randolph, N. Y.—subject: "Oratory and Eloquence;" D. W. C. Huntington, Bradford, Pa., "Rambles in Europe;" C. W. Winchester, Buffalo, N. Y., "Eight Wonders of the World." This course closed with a home entertainment, consisting of vocal and instrumental music, readings, essays, etc., mostly by members of the circle. Our number is at present nineteen, and we are happy to have proved those to be false prophets

who predicted that three months would be the limit of our existence.

District of Columbia (Washington).—The Parker Circle has been reorganized for the course of 1883-84. Several new members were received, and the circle now numbers about thirty-six. On Tuesday evening, the 18th, Dr. Dobson, our president, will organize a new circle in another part of the city, beginning with a dozen members. Foundry Circle reorganizes the same night, and several new circles will be organized during the fall. There is considerable interest manifested in the course.

Maryland (Baltimore).—The Class of 1887 was organized on Thursday evening, September 20, at the Young Men's Christian Association Hall. The membership for the coming year will be about thirty. The officers constitute the committee on instruction. The class of the past year, the fourth since its organization, was one of the best; the method adopted was that of the question box; each member placing such questions of interest in the box as he had met with in his reading. The director, Prof. J. Rendell Harris, would read the questions one at a time, and open the discussion upon them, in which all joined. Two meetings each month from October to June were held, and the entire time spent on the three books, the rest of the books being used for home reading only. This plan was considered preferable to the study of two or three at one time. The outlook for the new class is good.

Ohio (Harrisburg).—We have eleven members, of whom ten are regular members of the C. L. S. C. Our method of work thus far has consisted of essays, readings, and conversations. The interest in the work increases with each meeting.

Illinois (Fairburg).—We have here a small circle of eight members. We have met regularly once a week, taking each study in its course, and in an informal way have discussed the various subjects presented. Much interest has been felt and expressed, and we all feel that a prescribed course of reading is by all means the best and most direct means of self-culture.

Illinois (Yorkville).—For the past two years quite a number of our people have pursued the course of studies, but not until last year did we see proper to unite with the home society. Our class comprised lawyers, bankers, insurance agents, carriage trimmers, preachers, teachers and farmers. All feel that it has been two years of very profitable study for us. We closed our last year's study by a meeting at the residence of one of the members, where we were entertained by a program consisting of essays, character sketches, class history, music, and last, but not least, refreshments for the inner man. It was indeed an enjoyable occasion. We hope to organize a much larger class for the coming year.

Tennessee (Knoxville).—The local circle at this place reorganized this year with a membership of twenty-eight, an increase of twenty over last year. How was this accomplished? The secret can be given in just two words: *personal influence*. At the close of last year we felt that our circle here was dying. The members were negligent about the preparation of lessons, careless and indifferent about attendance, and we disbanded for the summer, feeling almost discouraged, yet in the heart of each member was a secret determination to do something to make the circle more interesting next year. One of our members went to Montevallo, another to Europe, and another to Chautauqua. Those who remained at home worked also for the C. L. S. C., and all worked earnestly and with enthusiasm. We thought, wrote and talked C. L. S. C. until our friends laughingly called us "people of one idea." We sent for circulars, which we gave to every one whom we could betray into the slightest expression of interest. We loaned our books and magazine with the request, "please just look it over and tell us what you think of it." The seventh of September

we held a meeting at the Y. M. C. A. rooms, kindly tendered to us for that purpose. All who were interested in the C. L. S. C. were invited, and two of the ministers of our city also encouraged us by their presence and cheering words. Then we began to reap the fruits of our summer's work. Seven new members were reported and two more asked for membership. Another meeting was held September 21 for reorganization, at which six new names were reported and five more requested admission to the circle, making our number twenty-eight. The circle will meet once a week, and we hope to accomplish results worthy of our enthusiasm. We send greeting to our sister circles, especially to the weak, to whom we would say: *Use your influence as a society and as individuals, and success is yours.*

Michigan (Niles).—Our circle was organized last October, with thirteen members. We have held thirty-three meetings, at which reviews upon the topics studied and readings from THE CHAUTAUQUAN have formed part of the program. In addition, we have read Bryant's translation of the "Iliad," and "Evangeline." All the Memorial Days have been kept. Selections from the author, sketches of his life and home, responses to roll-call with quotations from the same, and familiar talks upon the subject of the memorial, have made these occasions of unusual interest.

Michigan (Imlay City).—On Tuesday evening, November 28, 1882, we organized a local circle of the C. L. S. C. We have eight regular and three local members. The meetings have been held once in two weeks, at the houses of the members, and from the interest manifested in the work, we have every reason to hope for a large increase in numbers next year. On the evening of February 27 we observed Longfellow's birthday by an interesting program of essays, readings, recitations and songs. We closed with a sentiment from each one present, from Longfellow.

Wisconsin (La Crosse).—A local circle was organized here last January. The membership is small, but we have been faithful to the work. Although we began very late, we have nearly completed the year's work. We are all glad we began such a course of study, and have found much pleasure in gathering round our "round-table." The prospects for an increase in numbers and interest for the coming year are encouraging.

Minnesota (Minneapolis).—The Centenary Circle has just finished the work of the year. Our circle has numbered forty-two in all, with six local members, though six, at least, have been unable to attend the meetings on account of distance,—one even living in another State—but most are keeping up their work. There has been more interest and enthusiasm all through the year than during our first year.

Minnesota (Albert Lea).—This is the first year of our local circle, and we number five, all ladies with home cares. We have short sketches of the "Required History Readings" in THE CHAUTAUQUAN, which we think make us remember them better. We are reading the "White Seal Course" aloud, and enjoy it so much. Can not be glad enough that we have taken up this course.

Iowa (Muscatine).—The Acme Circle is composed of fifty-five members, with an average attendance of thirty-five. We are very enthusiastic, and expect to take the examinations. We recite the lesson, occasionally reading a part which it does not seem worth while to commit to memory. Our exercises are varied by essays on topics of importance in connection with the lesson.

Iowa (St. Charles).—I wish to report from our town a circle of three (myself and family). We hold no regular meetings. Although we began the first year's course late last December, we have completed the reading up to this month. It has been very profitable and entertaining to us. We are each determined

to complete the course. We will advertise it in our county papers, and do our utmost to solicit members and get up local circles. We do not think any better plan than the C. L. S. C. could be devised for furnishing those who have not the privilege of an academic or collegiate course an opportunity to acquire a good practical education.

Texas (Palestine).—The Houston *Daily Post* gives the following history of the local circle in Palestine: Some young people and some adults of Palestine have formed themselves into a branch of the now world-renowned Chautauqua Literary and Scientific Circle, and have entered upon the four years' course of study prescribed by that institution. The circle was organized in October, 1882, and now has a membership of twenty-three. Meetings are held every week at the homes of the members. The evenings thus spent are highly profitable to the members, socially and intellectually. Dr. Yoakum has assisted the circle greatly by lectures and talks on geology, astronomy, botany and history. The program of exercises is varied semi-occasionally from the regular channel, and the evening is spent in purely a literary way. Such seasons of refreshment occur on the birth anniversaries of popular authors. On the 23d of April a Shakspeare memorial meeting was held at Sterne's Hotel, on which occasion Mrs. Overall read "The Fall of Cardinal Wolsey." Miss Kate Colding rendered "Hamlet's Soliloquy" most admirably. Miss Florence Finch presided at the organ and lead in the Chautauqua songs. On May 1 the circle did honor to the life and memory of Addison. Mrs. J. C. Bradford read a sketch of his life and writings, Miss Ena Sawyers read "The Omnipresence and Omniscience of the Deity," and Miss Fannie Reese read "The Vision of Mirza."

California (Brooklyn).—Our circle is an informal quartet of congenial spirits who have been close friends and companions for some time past. We meet every Monday evening and have a delightful free and easy discussion over what we have read during the week, with Webster's Unabridged in its post of honor—the piano stool, and the encyclopædia rack within reachable distance. We are enjoying the course very much, and feel that it is just what we need.

HOW TO CONDUCT A LOCAL CIRCLE.*

THE TROY METHOD OF ORGANIZING A CIRCLE.

The "Rock of Ages" was sung, a prayer was offered by Mr. Martin, after which Mr. Farrar said:

I desire to give you a little history of the inauguration of our circle work in Troy. I do so because I am confident that what was done there last year may be done in every city, in every village, and may be multiplied a thousand times.

About the middle of last September I wrote an article on "Reading, Circles for Reading, and The C. L. S. C.," and published it in the Troy *Daily Times*.

I wrote this article, published it on Wednesday, calling a meeting at my church for Thursday evening, inviting anybody and everybody who desired, to be present. The evening was quite unfavorable. I expected about twenty. I was exceedingly surprised and gratified in the interests of the C. L. S. C. work when I found nearly three hundred people present. Being inspired by their presence, I began to talk to them on reading, the importance of it, the value of it to-day, and the cheapness of literature. I unfolded to them the C. L. S. C. plan, the numbers that were taking it up, the enthusiasm that prevailed here at Chautauqua, and how the Circle was spreading all over the world, not only in this country but in other countries. It was all new to many of them.

At the conclusion of my half hour's talk I asked how many persons wanted to join some such circle as this. About every hand in the audience went up. I was surprised again. Looking over the audience, I knew nearly every one of them, for I was back the second time as pastor of the same church, and knowing that four or five denominations were represented there, I suggested that there ought to be a circle in every church. I did not want to "scoop up" the whole right there in our church, and I was generous enough to say that there ought to be a dozen circles established in our city, one in connection with every church, and in the suburbs. I said that a week from that night we would organize a circle there, and any who desired to be connected with that circle would be gladly welcomed.

During the week I received several letters from parties in the city, and out of the city, asking about the C. L. S. C., what its course of reading was, etc. I followed it in the *Daily Times* with another letter on Wednesday, saying that our circle was to meet on Thursday, and explaining the text books that we were to take up for the year, and more fully entering into the C. L. S. C. idea. Our evening came, and we had over three hundred present. I had the whole list of books with me. I took them up and showed them to each person. I said, "this is the course." I went on unfolding the whole idea of the course, the amount of time each year, the examinations at the end of the year, and the outlook of the four years' course. I told them that this was the student's outlook from college halls, with the exception of the mathematics and the languages to be translated.

Then I asked how many desired to join this Circle. Over two hundred hands went up. Immediately we fell to organization. Fortunately, or unfortunately, I was elected president, and a Protestant Episcopal clergyman, rector of Christ Church, close by me, was elected vice-president. We have in our organization a president, vice-president, secretary, treasurer, and a board of managers consisting of five.

I found on inspecting the number that joined our circle that we were about equally divided—Baptists, Protestant Episcopalians, Presbyterians, and Methodist Episcopalians. Our board of managers was wisely selected from these various churches, so that there might be the largest remove possible from anything like an organization confined to our church. I say this because I believe that people are hungry for just such an organization as this. There are thousands in our communities who are tired of idle gossip. They want something to talk about, and the only way to stop gossip is to put something into their heads on a higher plane. I have had testimony from our members repeatedly, "Now we have so little time to talk about these other things." Whenever they come together they talk about these wonders found in the C. L. S. C. work.

This board of five managers arranges our monthly plan. Our large meetings are monthly. Our circle divides itself up; six or a dozen, or twenty, form little organizations, read together, meet once a week, and then we meet as a large circle monthly and review our work. This board of managers lays out the month's work. The first week after our monthly meeting this board of managers is called together. They make out their plan, print it on a postal card, and send it out at once to every member of the circle, so that every member knows what the plan is to be three weeks before the meeting. Our method in the large meeting is to review our work by the essay method.

Let me give you a program. First, singing. I was fortunate enough to have an enthusiastic singer in our number, and I gave him the work of organizing a glee club. He gathered twenty or twenty-five of the very best young people in the number, and formed a glee club, and they led our devotions. We followed with scripture and prayer. And then began our essays. We usually have three, four, sometimes five essays, and no essay is over ten minutes in length. We desire that the essays shall not exceed eight minutes. It requires a deal of

* Round-table held in the Hall of Philosophy, at Chautauqua, August 16th, 1883, conducted by Rev. H. C. Farrar, of Troy, N. Y.

skill and practice to reduce our thoughts on a subject to a six or eight minutes essay, but it is practicable. Then we are all interested in the subject which we have been studying for a month. When an individual rises and reads, we feel that we have gone over the same subject, and it is like a review to us, and helps to fasten it more definitely in our minds. Following each essay we have remarks and questions. We never criticise an essay. That would be unkind. You could not do it. You would intimidate everybody.

We ask questions and throw in additional remarks. We take up half an hour, or three-quarters at most, devoted to the three, four or five essays. Following these we appoint some person to ask the questions which are printed in *THE CHAUTAUQUAN*. Any person who will ask and answer these questions will find that he has a wonderfully clear *rèsumé* of the whole subject in his mind. I suppose that we are indebted to Mr. Martin for them. They are very clear, very concise, and greatly appreciated by the Troy members.

Following these questions we have a recess of twenty minutes, in which it is the custom of our circle to shake hands, make each others' acquaintance, encourage each other, find out about each other, and inquire about the work. Upon the recall the Glee Club gives a song. Then follows the round-table. I need not explain this because you are all familiar with the round-table. After that a *conversazione* on some prominent character of the world, old or new. We desire that every member will give us some extract of five lines, not to exceed five lines, unless it would break the harmony of the thought, from every person brought before us. We have had Shakspeare, Longfellow, Bryant, and a variety of persons.

Immediately after this *conversazione* follows "a miscellaneous exercise"—anything that needs to be taken up. While we were studying geology, we went down to the village of Albany where the capitol is located. They have a very fine series of geological rooms arranged by Prof. Hall, the State Geologist. As you enter the room, there are the very lowest specimens of the rocks with their fossils. As you go up story after story you reach the highest rocks. Prof. Hall, by previous appointment, met our large circle of about two hundred. We chartered a car or two and went down. He met us and gave us a very satisfactory lecture. We appreciated it.

When we came to astronomy, we found out where we could find an astronomer. We invited him, and he came and gave us a lecture. Then we had a teacher of the high school stand before us, and allow us to question him to our heart's content. We found it available to work in all the outside force possible. When we studied the subject of art we got together all the pictures of the town that we could find. I was in Gloversville as pastor at that time. We arranged them, and spent two or three very delightful evenings. You have two or three, another has one, another has six; bring them all together and discuss the whole subject of art. We found it very profitable.

In Troy our circle is so enthusiastic in its work that there is a constant clamor of outside people to get in. We sometimes allow a few outsiders, and there is hardly a session that we do not have four to five hundred in our gathering, but the front seats are always reserved for members, and visitors, if there be any, must take the back seats. There are anywhere from fifty to one hundred and fifty clamoring to be admitted into the circle this fall. I do not know what we shall do. If we admit them, we shall go into the audience room. I think it is better to divide up.

I have given you our work. I said in the outset, it is possible for any young man or woman, pastor or superintendent, through your village paper, to write a short article calling the attention of the people to it, saying that in such a place there will be an organization of this work. I have the impression that you can gather quite a large circle in every place, two or three of them. But my conviction is from the work as I have observed it through Troy and vicinity, that you need somebody

in that circle, at the head of it, who loves it. You can make nothing in this world grow without love. Not even the flowers you may plant in your garden will grow unless you love them.

As the result of the article in the *Troy Times*, eight circles were organized in our city. As the result of those two articles, twenty-six circles were organized around Troy.

I would be glad to hear from you to-day. Criticise my plan as much as you please. I have taken more time because Dr. Vincent urged me to do so. He urged me to take twenty-five minutes. I have only taken twenty. Give me your plans, any suggestions, any practical idea that you have worked out in your circles.

MR. MARTIN: I can say that I commend every feature that has been mentioned here by Mr. Farrar in the method of conducting local circles. I believe we have tested in Pittsburgh every one he has mentioned. There are several others we have tried, to which I would like to refer. For instance, I think it well for persons to start with the inspiration and a love of the Circle right here at Chautauqua. A great many persons have come to me on the ground, and asked me how to form a local circle, saying they had no local circles in their vicinity. I say to them if they have two or three members on the ground here who belong together in a circle, meet under the trees and start your organization here. We started with seven members under these trees by the Hall of Philosophy, in the year 1878, and we had somewhere between three and four hundred before the following January, and have as many more since. Last year about half a dozen who graduated in the class of '82 met under the trees here, and we formed our preliminary organization. We carried the spirit and love of the C. L. S. C. home with us, and we formed in Pittsburgh an alumni association of nearly sixty members. We expect to increase the number largely during the coming year.

One word with reference to the use of newspapers. Our executive committee apportion the different papers of the city between them. We have five members, and each member looks after a paper to see that the paper looks after C. L. S. C. matters. We make each member the editor of a C. L. S. C. department in a newspaper, and it is his duty to get in as many notices about the C. L. S. C. as possible. Our press has very generously opened to us its columns. Every monthly meeting is noticed before and after in the papers. I am glad to say that we have got into many considerable controversies in the newspapers. We like them because they bring our organization into notice.

We avail ourselves of the papyrograph, the electric pen, the type writer, and the various plans for duplicating that we now have, in the way of sending out notices, preparing the programs, etc. Any of you who know how cheaply any of these appliances can be used for printing, will see how efficiently they can be employed for the use of the circle.

Another point: If we get a little depressed, or a little behind, we get Dr. Vincent or one of the counselors to come and give us a rousing lecture. We have given them good audiences, and they have spread a new enthusiasm. What an amount of enthusiasm can be developed about the C. L. S. C. If you will have the patience to answer clearly and fully all questions that are asked you about the C. L. S. C., you will find that you are doing a grand missionary work. I know my business is often interrupted by people who come in and ask about the C. L. S. C., but I am always sorry if I ever have to turn any one away without information. If I give them full information, and they go away and join the C. L. S. C., and form a local circle afterward, I feel that I have done a missionary work.

MR. FARRAR: Any suggestions?

A VOICE: Did you permit persons to become members of your local circle who did not belong to the parent society?

MR. FARRAR: Yes. But we requested them, if they did not wish to take up the full course of reading, to join the C. L. S. C. and pay their fifty cents, and take *THE CHAUTAUQUAN*. We

honored the home office. But they need not fill out the questions unless they choose.

MR. BRIDGE: In that way you will get a great many members of the C. L. S. C. who are not doing the work.

MR. FARRAR: Very few. We took a few husbands who wanted to come with their wives. "Very good," I said, "pay your fifty cents and take THE CHAUTAUQUAN."

REV. J. O. FOSTER: We had a large circle where I was last appointed. We found in the school a man well posted in geology. We found the depot agent was an astronomer, and he was very enthusiastic over the invitation that we gave him. He came down and spattered the blackboard all over with facts. He got a long strip of paper and stuck up around the room, and marked out the planets. He gave us a very fine lecture on astronomy, so good that the people requested him to repeat it before the whole congregation. We had this "jelly-pad business," and struck off our programs the week before. Every one knew what he was expected to do. We secured plenty of books, if any one was at a loss for books. We had about twenty in the circle, and that circle is now running. I think it is three and a half years old. I do not know of any older than that.

MR. MARTIN: We have one five years old.

MR. FOSTER: Very good. Dr. Goodfellow organized this. Another member and I went to people in the city and asked them to lend us their pictures upon several subjects. You will be astonished at the amount of material you can gather together in a single afternoon to illustrate any subject.

DR. VINCENT: I have no doubt that some small local circles have quite unique plans which they have adopted, and I hope if they hesitate to speak out, that they will write out their plans for us.

A LADY: I was about to speak for a small circle. I am very positive in our circle of twenty it would be almost impossible to have essays, except occasionally. The members generally would be so frightened at the idea of having to write an essay that we should lose the circle entirely. We have to pet them a little, and we use the conversational method as freely as possible to get them to express themselves. What they can not tell we tell them. In my experience—I have been conductor four years—I find the essay method frightens small circles. Where you have circles of two hundred, where they have a great many ministers, and lawyers, you can get them to write essays.

A LADY: I would say that I belong to a circle out West of six members. We pursued the essay work for the first two years entirely. Every one of us for the first two years wrote an essay every week. [Applause.]

DR. EATON: I would like to speak for another small circle. We had a program. We opened with singing and prayer, and then the leader, who had prepared himself thoroughly, or tried to prepare himself thoroughly on the lesson, particularly in science and in history, examined every class by questioning and removing every difficulty connected with them. The whole circle replied at once, answering the questions. If there were any in the circle that could not answer a question, they had it answered for them, and were not placed under any embarrassment by the sense of failure. A great many said of these meetings every two weeks, that they obtained a better knowledge by this thorough drill than by reading privately at home. Likewise we had essays, but not very frequently. We had essays in the first part of the evening. Sometimes there was a failure to respond, but generally the subject was assigned to particular individuals, and a great many facts in connection with the difficulties in history were brought in that way. I think we commenced with a circle of about twenty or thirty, and we graduated here a year ago some sixteen members, I think. And others are coming in, but with what success I am unable to say, as I have not been in that place all the time. I think that every one in that circle would bear testimony that in this way—by close examination, the plan of a regular class drill—we have obtained

a better knowledge than in any other way, and that they were satisfied at the end of the year they had accomplished more and better work than they would under any other circumstances.

A VOICE: I would like to say we consider that the writing of these essays and insisting upon it, was as much for the advantage of the persons writing these essays as for that of those who listened to them. Therefore, we had a critic who was to write the criticisms, and had them read by the president. Do you think that was a good way?

MR. FARRAR: We thought it was not the best way. Dr. Vincent suggests that the criticisms might be given privately to the writer. I found it quite difficult to get essays. Many young ladies and gentlemen looked upon it as a fearful task. Many times I had to call on them, and sit down with them, and talk them into it, showing them how they could do it. And never one wrote an essay in our circle but said "When you want me to write an essay, call on me again." I have tried a dozen others who persisted in refusing, but at the close of the year they came to me and said: "If you will forgive us for our refusing to write you may call upon us next year."

After singing, the benediction was pronounced by Dr. Vincent.

[Not required.]

QUESTIONS AND ANSWERS.

ONE HUNDRED QUESTIONS AND ANSWERS ON "HISTORY OF GREECE," VOLUME II, PARTS IO AND II—"THE ROMAN SUPREMACY, AND BYZANTINE HELLENISM."

By A. M. MARTIN, GENERAL SECRETARY C. L. S. C.

1. Q. When is it generally said by historians that Hellas fell under the Roman rule? A. In 145 B. C., when Mummius captured Corinth.

2. Q. Strictly speaking, when did Hellas become a Roman province? A. During the reign of Augustus.

3. Q. Where was the principal theater of the Mithridatic war? A. Hellas, transplanted thither by the daring king of Pontus.

4. Q. Whom did the Romans finally find it necessary to send against him? A. Sulla.

5. Q. During this war what Hellenic city did Sulla capture after a long siege? A. Athens.

6. Q. What is the assertion of several modern historians in regard to the devastation of the land and the slaughter of the inhabitants during this war, which ended in 84 B. C.? A. They did their work so effectually that Asia never thereafter recovered from the Roman wounds.

7. Q. By what was the moral decay of the nation which began long before now followed? A. By a corresponding material ruin.

8. Q. By what was the Ægean Sea from the earliest times invested? A. By pirates, who boldly attacked the coasts, islands and harbors, seizing vessels and plundering property.

9. Q. In the year 78 B. C., what action did the Romans take against these pirates? A. They declared war against them, and entrusted the conduct of hostilities to Pompey.

10. Q. What was the result of Pompey's expedition against them? A. Ten thousand of them were put to death, twenty thousand captured, and one hundred and twenty of their harbors and fortifications were destroyed.

11. Q. In the great struggle between Pompey and Cæsar for the supremacy of the world, whom did Hellas furnish with every possible assistance? A. Pompey.

12. Q. In the year 44 B. C., what Hellenic city did Cæsar rebuild that had been destroyed a hundred years before by Mummius? A. Corinth.

13. Q. In the Roman civil wars which followed the death of Cæsar, with whom did Athens ally herself? A. With Brutus and Cassius.

14. Q. After the defeat of Brutus and Cassius by Octavius and Anthony, followed by hostilities between the latter two, for whom did the greater part of Hellás declare? A. For Anthony.

15. Q. Shortly after Octavius assumed the name of Augustus to what did he reduce Hellas? A. To a Roman province.

16. Q. What is said of the jurisdiction of the Roman proconsul thereafter sent annually to rule Hellas? A. Many cities and countries continued still to be regarded as "freed and allied." The subject territory was designated by the name of Achaia as if it did not remain an integral part of "free Hellas."

17. Q. During the reign of Tiberias what did both Achaia and Macedonia become by reason of the harsh treatment received from the proconsuls? A. Cæsarean instead of public provinces.

18. Q. What was the course of Nero toward Hellas? A. In the year 66 he declared the country autonomous, and at the same time plundered Hellas, inflicting far greater misfortunes on it than those sustained through the invasion of Xerxes.

19. Q. When Vespasian ascended the throne what political change did he make? A. He reduced the country again to a Roman province.

20. Q. During the reign of Vespasian what action was taken in regard to the Greek philosophers? A. Nearly all the Greek philosophers were banished from Rome.

21. Q. How did Trajan prove to be one of the greatest benefactors of the Hellenic nation? A. He sent Maximus to Hellas as plenipotentiary and reorganizer of the free Hellenic cities, with instructions to honor the gods and ancient renown of the nation, and revere the sacred antiquity of the cities.

22. Q. What was Hadrian's treatment of Hellas? A. He visited Athens five times; sought to ameliorate the condition of the people, and adorned Athens and other cities with temples and buildings.

23. Q. What political rights did he give the Hellenes? A. The rights of Roman citizenship.

24. Q. During the reigns of what two Roman emperors did Hellas pre-eminently flourish? A. The Emperors Antoninus Pius and Marcus Aurelius.

25. Q. Notwithstanding the benefits received from the Roman emperors what did Hellas continue to do? A. To wither and decline.

26. Q. During the latter part of the third century what destructive invasion of Hellas took place? A. The invasion of the Goths and other northern barbarians, who overran the country like a deluge, depopulating cities and destroying everything in their path.

27. Q. What relation does our author give Hellenism to Christianity? A. He makes it the first herald of Christianity.

28. Q. Who was the first Roman emperor that issued a decree in favor of Christianity? A. Constantine the Great.

29. Q. What discussions led Constantine to the convocation of the first General Council of the Christian Church, which assembled at Nice in A. D. 325? A. The discussions of Arianism, or opinions concerning the nature of the second person of the Trinity.

30. Q. Who was the most noted opponent of Arianism? A. Athanasius.

31. Q. What city did Constantine dedicate as the capital of his empire? A. Constantinople.

32. Q. During the general slaughter of the relatives of Constantine that took place after his death, what cousin of his escaped and was assigned to the city of Athens for his place of habitation? A. Julian.

33. Q. By comparing the present with the past, to what conclusion did Julian arrive as to the cause of the decline of the empire? A. That Christianity was the cause of the decline, or was not adapted to prevent the demoralization of the empire; that the change of affairs resulted from the debasement of the ancient religion and life, and that the reformation of the world could only be accomplished through their reëstablishment.

34. Q. By what class of philosophers was Julian sustained in his views? A. By the Neapolitanists.

35. Q. After Julian was recognized as emperor what was his main object on entering Constantinople? A. The restoration of the ancient religion.

36. Q. What were some of the steps he took to accomplish this object? A. He restored the ancient temples and caused new ones to be erected to the gods; the games were celebrated with magnificence, and the schools of philosophy were especially protected.

37. Q. Who was the successor to Julian? A. Jovian.

38. Q. What was his course toward Christianity? A. He abolished the decrees enacted by Julian on behalf of idolatry, and seemed favorably inclined toward Christianity, but he died suddenly on his way to Constantinople.

39. Q. About this time what two names became prominent in theological controversies? A. Basil the Great and Gregory the theologian.

40. Q. What new invasion of the northern barbarians took place in the latter part of the fourth century? A. That of the Goths, who overran Thrace, Macedonia and Thessaly, ravaged the country, killed the inhabitants, and destroyed the cities that were not strongly fortified.

41. Q. To what did Theodosius first direct his attention after he became emperor? A. To the pacification of the Goths, and succeeded within the space of four years in rendering them if not fully submissive to his scepter, at least anxious to seek terms of peace.

42. Q. What did the solemn edict which Theodosius dictated in 380 proclaim? A. The Athanasian doctrine of the Trinity, branded all who denied it with the name of heretics, and handed over the churches in Constantinople to the exclusive use of the orthodox party.

43. Q. What synod did he convene at Constantinople a few months afterward, in the year 381? A. The second General Council of the Christian Church, which completed the theological system established by the Council of Nice.

44. Q. After the death of Theodosius, who were the nominal rulers of the Roman empire? A. Arcadius in the East, and Honorius in the West, both sons of Theodosius.

45. Q. Who, however, were the real rulers of the empire? A. Rufinus in the East and Stilicho in the West.

46. Q. How are each characterized? A. Stilicho was noted for his military virtues, but Rufinus became notorious only for his wickedness.

47. Q. Failing in his project of marrying his daughter Maria to Arcadius, how did Rufinus seek to revenge himself? A. By plotting the destruction of the empire itself.

48. Q. What barbarians is it said he called into the empire? A. The Huns, who laid waste many provinces in Asia; and Alaric, the daring general of the Goths, who invaded Hellas, plundering and destroying everything in his path.

49. Q. Who, called the greatest orator of Christianity, became archbishop of Constantinople near the close of the fourth century? A. John Chrysostom.

50. Q. After the death of Arcadius, who virtually assumed the government of the empire? A. Pulcheria, the daughter of Arcadius.

51. Q. What are we told as to the kind of life she led? A. That she embraced a life of celibacy, renounced all vanity in dress, interrupted by frequent fasts her simple and frugal diet, and devoted several hours of the day and night to the exercises of prayer and psalmody.

52. Q. How did her brother Theodosius, who was the nominal emperor, spend his time? A. His days in riding and hunting, and his evenings in modeling and copying sacred books.

53. Q. How long did Pulcheria continue to reign? A. For nearly forty years.

54. Q. What is said of the condition of Hellenism in the meantime? A. It continued to wither in Hellas, while the mod-

ern began to spread and strengthen itself in Constantinople.

55. Q. What is said of Hellenic literature from this time onward? A. It produced none of those works by which the memory of nations is honored and perpetuated.

56. Q. To what is its intellectual decline mainly due? A. To the incursions of the barbarians, by which society was shaken to its very foundations, and the genius and enterprise of the nation almost paralyzed.

57. Q. Under what leader did the Huns ravage without restraint and without mercy the suburbs of Constantinople and the provinces of Thrace and Macedonia? A. Attila, called the "Scourge of God."

58. Q. With the dethronement of what emperor did all political relations between Rome and the Eastern Empire cease? A. Romulus Augustulus in 476.

59. Q. How did the emperors of the East continue to be styled? A. They continued to be styled emperors of the Romans, but legislation, government, and customs became thoroughly Hellenized.

60. Q. What was the mainspring of the success in life of Justinian who became emperor in 527? A. An unrestrained desire for great deeds and his wonderful good fortune in the choice of ministers.

61. Q. What military victories glorified the early years of his reign? A. Splendid victories over the Persians.

62. Q. What general began his career in this war? A. Belisarius, the general who imparted such eminent distinction to the reign of Justinian.

63. Q. What were Justinian's most glorious and useful memorials? A. The composition of the celebrated collection of laws comprising the Institutes, the Digest or Pandects, and the Code.

64. Q. To whom was the work entrusted? A. To ten law-teachers, over whom the famous Tribonian presided.

65. Q. What are of special importance as among other memorable events which signalized the reign of Justinian? A. The successful wars which he waged against the Vandals in Africa and the Goths in Italy, and his expeditions to Sicily and Spain.

66. Q. Among the many edifices erected during the reign of Justinian which is the most famous? A. That of St. Sophia.

67. Q. To what epoch does the reign of Justinian partly belong? A. To the Roman epoch of the Eastern Empire.

68. Q. What does the reign of Heraklius from 610 to 641 form? A. An integral part of mediæval Hellenism.

69. Q. By what was Heraklius invited to ascend the throne, and how long did his posterity continue to reign over the empire of the East? A. The voice of the clergy, the senate, and the people invited him to ascend the throne, and his posterity till the fourth generation continued to reign over the empire of the East.

70. Q. In 627, after many brilliant actions, what defeat did Heraklius inflict upon the Persians? A. So severe a defeat that their empire was nearly crushed.

71. Q. Almost at the same time what unexpected and more terrible opponent arose in the Arabian peninsula whose conflict with Hellenism continues to the present day? A. Mohammedanism.

72. Q. What did the Mohammedans of Arabia wrest from the empire? A. Syria, Egypt, and Northern Africa.

73. Q. What was the Mohammedan religion called, and to what two dogmas was it limited? A. Islam, meaning devotion; its dogmas were the belief in a future life, and the unity of God.

74. Q. In what words was the latter expressed? A. "There is only one God, and Mohammed is the apostle of God."

75. Q. Who was the next emperor of real historic value after the death of Heraklius? A. Constantine IV., surnamed Pogonatus, or the Bearded.

76. Q. For what was the reign of Constantine especially memorable? A. For the first siege of Constantinople by the Mohammedans.

77. Q. How long did this siege last? A. For seven years, but was not carried on uninterruptedly throughout this time.

78. Q. What was the result of the siege? A. The Mohammedans were finally forced to relinquish the fruitless enterprise in 675.

79. Q. What formidable weapon did the Byzantines employ during this siege, the composition of which is now unknown? A. The Greek fire.

80. Q. What declarations of an œcumenical council he convoked at Constantinople in 680 did Constantine sanction by a royal edict, and thus reëstablish religious union in the empire? A. That the church has always recognized in Christ two natures, united but not confounded—two wills, distinct, but not antagonistic.

81. Q. When did the next siege of Constantinople by the Mohammedans take place? A. In the year 717, during the reign of Leo III.

82. Q. What was the result? A. In the following year the Arabs were driven away, having suffered a loss of twenty-five hundred ships and more than five hundred thousand warriors.

83. Q. What decrees did Leo III. issue in 726 and 730? A. A decree forbidding the worship of images, and another banishing them entirely from the churches.

84. Q. How did these decrees divide the nation? A. Into two intensely hostile parties, of iconoclasts or image-breakers, and image-worshippers, by whose contests it was long distracted.

85. Q. What action did Leo V. take in regard to image-worship? A. He not only banished the images from the churches, but also destroyed the songs and prayers addressed to them.

86. Q. What further order was made in regard to their worship by Theophilus who became emperor in 829? A. He forbade the word "holy" to be inscribed on the images, and also that they should be honored by prayers, kissing, or lighted tapers.

87. Q. After the death of Theophilus what action did the empress Theodora, into whose hands the positive power of the government passed, take in regard to the images? A. She herself worshiped images. The pictures were again hung in the churches, and the monastic order more than ever became potent both in society and government.

88. Q. During the reign of Alexius what storm suddenly burst from the west? A. The so-called First Crusade.

89. Q. Who was the Pope at this time? A. Urban II.

90. Q. By whom were the crusades first incited? A. Peter the Hermit.

91. Q. When did Jerusalem fall into the hands of the crusaders? A. July 15, 1099.

92. Q. Who were the leaders of the second crusade? A. Conrad III., king of Germany, and Louis VII., king of France.

93. Q. What was the ostensible intention of the crusaders? A. To free Eastern Christianity from the oppression of the Turks.

94. Q. What does our author say was their ultimate object? A. The capture of Constantinople and the abolition of the Byzantine empire.

95. Q. What was the result of the second crusade? A. It was wholly inglorious, being relieved by no heroic deeds whatever.

96. Q. What took place in Syria during 1187? A. The Christian authority was overthrown in Syria, and Jerusalem was captured by Saladin, the sultan of Egypt.

97. Q. What occurred to Constantinople during the fourth crusade, in the year 1204? A. After a siege of five months it fell into the hands of the crusaders.

98. Q. When and by whom was Constantinople recovered? A. In 1261, under the leadership of Michael Palæologus.

99. Q. When was Constantinople again attacked by the Turks? A. In 1453, under the famous Mohammed II.

100. Q. What was the result of the final decisive engagement? A. The city fell before overwhelming numbers, and passed under Turkish rule.

OUTLINE OF C. L. S. C. STUDIES.

NOVEMBER, 1883.

The C. L. S. C. readings for November include parts 10 and 11 of Timayenis's "History of Greece," for students having read the first volume; or from page 93 to the end of "Brief History of Greece," for students of Class of '87.

Chautauqua Text-Book, No. 5, "Greek History."

Readings in THE CHAUTAUQUAN.

First week (ending November 8)—1. "History of Greece," from page 258 to "Arius," page 293; or, "Brief History of Greece," from page 93 to "The Battle of Salamis," page 118.

2. Readings in German History and Literature in THE CHAUTAUQUAN.

3. Sunday Readings in THE CHAUTAUQUAN, for November 4.

Second Week (ending November 15)—1. "History of Greece," from "Arius," page 293, to chapter viii, page 328; or, "Brief History of Greece," from "The Battle of Salamis," page 118, to "Life of Socrates," page 143.

2. Readings in Physical Science and Political Economy in THE CHAUTAUQUAN.

3. Sunday Readings in THE CHAUTAUQUAN, for November 11.

Third Week (ending November 22)—1. "History of Greece," from chapter viii, page 328, to chapter iii, page 359; or, "Brief History of Greece," from "Life of Socrates," page 143, to "Causes of the Sacred War," page 169.

2. Readings in Art, in THE CHAUTAUQUAN.

3. Sunday Readings in THE CHAUTAUQUAN, for November 18.

Fourth Week (ending November 29)—1. "History of Greece," from chapter iii, page 359, to the end of part II, page 342; or, "Brief History of Greece," from "Causes of the Sacred War," page 169, to the end of the book.

2. Readings in American Literature in THE CHAUTAUQUAN.

3. Sunday Readings in THE CHAUTAUQUAN, for November 25.

CHAUTAUQUA NORMAL CLASS.

Season of 1884.

J. L. HURLBUT, D.D., and R. S. HOLMES, A.M., INSTRUCTORS.

I. The course of instruction to be pursued in the Sunday-school Normal Department of the Chautauqua Assembly, at its session in 1884, will embrace lessons upon the following subjects, prepared by the instructors in the department. The full text of these lessons will be printed during the year in THE CHAUTAUQUAN, which should be taken by all who desire to prepare for the Normal Department.

Twelve Lessons on the Bible.—(1) The Divine Revelation; (2) The Bible from God through Man; (3) The Bible as an English Book; (4) The Canon of Scripture; (5) The World of the Bible; (6) The Land of the Bible; (7) The History in the Bible; (8) The Golden Age of Bible History; (9) The House of the Lord; (10) The Doctrines of the Bible; (11) Immanuel; (12) The Interpretation of the Bible.

Twelve Lessons on the Sunday-school and the Teacher's Work.—(1) The Sunday-school—its Purpose, Place, and Prerogatives; (2) The Superintendent—his Qualifications, Duties, and Responsibility; (3) The Teacher's Office and Work; (4) The Teacher's Week-day Work; (5) The Teacher's Preparation; (6) The Teacher's Mistakes; (7) The Teaching Process—Adaptation; (8) The Teaching Process—Approach; (9) The Teaching Process—Attention; (10) The Teaching Process—Illustration; (11) The Teaching Process—Interrogation; (12) The Teaching Process—Reviews.

II. Students of the Normal Course should study in addition to the outlines in THE CHAUTAUQUAN, the following Chautauqua Text-Books (ten cents each): No. 18, "Christian Evidences;" No. 19, "The Book of Books;" No. 36, "Assembly Bible Outlines;" No. 37, "Assembly Normal Outlines;" No. 38, "The Life of Christ;" No. 39, "The Sunday-school Normal Class"

(including the preparation of the Normal Praxes), and No. 41, "The Teacher Before his Class."

III. Students of the Normal Course are also desired to read the following books: Chautauqua Text-Book No. 1, "Bible Exploration;" No. 8, "What Noted Men Think of the Bible;" No. 10, "What is Education?" No. 11, "Socrates;" and "Normal Outlines of Christian Theology," by L. T. Townsend (price, forty cents). These books may be obtained of Phillips & Hunt, 805 Broadway, New York; or of Walden & Stowe, Cincinnati or Chicago.

IV. Students in special classes in churches or schools, or individual students who prosecute the course as given above, may receive by mail outline memoranda for examination, and if they can certify to having studied the lessons and text-books, and will also prepare the Normal Praxes named in Chautauqua Text-Book No. 39, and fill out the Outline Memoranda, may receive the diploma of the Chautauqua Teachers' Union, and will be enrolled as members of the Chautauqua Society. Such students will send name and address, with twenty-five cents, to Rev. J. L. Hurlbut, D.D., Plainfield, N. J.

CHAUTAUQUA NORMAL CLASS—BIBLE SECTION.

Twelve Lessons on Bible Themes.

LESSON I.—THE DIVINE REVELATION.

I. There is in me a something which is called mind. I do not know what it is. I can neither tell whence it came, nor whither it will go when it ceases to inhabit this body. That in me, which is thus ignorant concerning the mind, is the mind itself. There are therefore matters beyond my mental range. That is, my mind is limited, bounded, finite in its powers. What is true of my mind is true of all human mind. Here then is one of the first results of consciousness: **FINITE MIND IN THE WORLD.**

II. This finite mind did not produce itself; it sees in the body which it controls evidence of a design of which it is not the author. It turns to the phenomena of the universe and discovers in them the same evidences of design. It seeks the attributes and character of the designer or designers of human body and of natural phenomena, and finds them to be unlimited in action, unbounded by time or space, infinite in power, and uniform in manifestation. It therefore concludes that there is but one designer of all the phenomena of created nature, and that he is both intelligent and infinite. Here then is a second result of consciousness: **INFINITE MIND IN THE UNIVERSE.**

III. We have so far brought to view two powers, infinite mind in the universe and finite mind in the world, and between them a distance immeasurable and impassable from the finite side. They are extremes in the progression of the universe. Let us notice some facts concerning each of these powers:

1. The infinite mind is self-existent; eternal.

2. The infinite mind created finite mind in its own likeness. Both these points will be considered in our lesson on the "Doctrines of the Bible."

3. The infinite mind has *provided a means of passing the distance between itself and the finite mind*, so that the finite might know the infinite; i. e. it has revealed itself to the finite mind.

4. The finite mind is the highest created existence. This is left without discussion for the student to amplify.

5. The finite mind exists because of the infinite mind. The gas jet burning above my head affords an illustration. It exists because of a well-stored gasometer two miles away; because of complicated machinery by which coal has been caused to yield up its hidden stores of light; because of a system of underground conductors that terminates in the burner on the wall. Without the burner and the light all these appliances would be useless; and they in turn exist only that there may be light. So the finite mind exists because of the infinite—nor can we think with satisfaction of infinite mind in the universe and no creation or correlated force.

6. The finite mind hungers to know the infinite; it peers into the measureless space which its eye can not pierce, and longs for the infinite to reveal itself. This fact is historical, "Canst thou by searching find out God?" has been the question of the ages; and the answer has been "the world by wisdom knew not God." The cry of multitudes of hungering souls has been: "O, that I knew where I might find him." As light is necessary to the eye, and air to the bird's wing, and sound to the ear, that each may perform the work for which it is adapted, so a knowledge of the infinite mind that is of God, is essential that the finite mind—that is, man—may fulfill its destiny. And this knowledge is possible only through self-revelation by God to man. That such a revelation has been made we have already asserted. That the Bible is that revelation is our claim, which we will discuss in a future lesson. The present lesson will be content to inquire simply, how that revelation has been effected. We answer:

God wrought it out in the presence of the race in ways unmistakable, exhibiting every attribute of his character, even to those of mercy and forgiveness. God wrought (not wrote). What we call the inspired Word is a mediate, not an immediate act of God. God wrought, the work extending through many ages, perhaps not even yet finished.

Wrought (a) in nature, so that "the invisible things of him since the creation of the world are clearly seen, being perceived through the things that are made." Creation then is itself a part of the revelation, but only a part; for out of it comes no hint of forgiveness or redemption.

(b) In man, by spiritual manifestations, by intellectual enlightenments, by illuminations of conscience, such as could not originate in the human soul. These revelations or workings of God in man mark a large portion of the history of thought through the ages; and in that dim twilight of the race, when men like Enoch walked with God, though history is but a shadow, yet it is the shadow of God working in man.

(c) In Providence—that is, in his ordering the work of the world. He not only "produced a supernatural history extending through centuries, . . . and working out results which human wisdom could never have conceived, nor human power executed,"* but also he has directed all the workings of all history in accordance with the central purpose of his revelation.

(d) In grace, by his spirit revealing what the human mind could never have discovered for itself, redemption and atonement through forgiveness of sin.

IV. This divine revelation so wrought by God *has been, and is being reported* that all the world may know and confess that "the Lord, he is the God." Reported:

1. *Through Tradition.*—There was an unwritten Bible before the written word, handed down from patriarchs to scribes; and even in lands destitute of the Scriptures, we trace the dim outlines of truth transmitted from ancient authority.

2. *Through Philosophy.*—Wise men and thinkers have read the revelation in nature and gathered it up from human thought, and the highest philosophy, as that of a Socrates and a Plato, finds God.

3. *Through Prophecy.*—In the earlier ages, and perhaps through all the ages, God has communed with chosen men who have lived in fellowship with himself; and has made them the mouthpiece uttering his will to the world.

4. *Through Preaching.*—The pulpit, when it is true to its mission, voices the message of God to man.

V. *We find also that this divine revelation has been written out, under a divine direction:*

1. *In Various Books.*—The Bible is not one book, but sixty-six books, a whole library, presenting the divine revelation under varied aspects, but all under one divine origin and super-vision.

2. *By Various Writers.*—Not less than thirty authors, and

probably many more, shared in the composition of the Scriptures, but all wrote under a divine control, and expressed, each in his own style, the mind of the Spirit.

3. *Through Various Ages.*—Moses may have begun the writing, doubtless from earlier documents. Samuel, David, Solomon, Isaiah, Ezra, Matthew, Paul, John, each in turn carried on the work through a period of sixteen hundred years. The book grew like a cathedral, rising through the centuries, under many successive master-builders, yet according to one plan of one divine Architect.

4. *In Various Languages.*—Two great tongues, one Semitic, the other Aryan, were employed, the Hebrew in the Old Testament, the Greek in the new; but the Hebrew of Moses is not that of Daniel a thousand years later.

VI. *We find this divine revelation preserved:*

1. *By being stereotyped into Dead Languages.*—A living language is ever changing the meaning of its words; and truth written in it is in danger of being misunderstood by another generation. But the words of a dead language, like the Hebrew and the Greek, are fixed in their meaning, and once understood are not likely to be perverted. Soon after the Bible was completed, both its languages ceased to be spoken, and have been kept since as the shrine for the great truths contained in the Word.

2. *By being translated into Living Languages.*—The Bible has been translated into all the tongues of earth, and thus its perpetuation to the end of time has been assured. No other work has been read by so many races, and no other is so capable of being understood by the masses of mankind.

3. *By being incorporated into Literature.*—If every copy of the Scriptures in the whole world were destroyed every sentence of it could be reproduced from the writings of men, since it has become an integral part of the thought of the world.

4. *By being perpetuated in Institutions.*—The Jewish church perpetuates the Old Testament; the Christian church the New; and while either endures, the Bible containing the divine revelation must endure.

VII. *We find this divine revelation proved:*

1. *By Testimonies.*—The child looking upon the opened page of the Bible at his mother's knee, accepts her testimony that it is the word of God, and thus each generation receives the book from the preceding generation with a declaration of its divine origin.

2. *By Probabilities.*—Such has been the history of this book in its relation to the world, and its triumph over opposing forces; such has been its early, continuous and present acceptance; that there is every probability in favor of its being, what it appears to be, a divine book.

3. *By Experience.*—There are many who have put this book to the test in their own lives; have tried its promises; have tasted its spiritual experience; have brought it into contact with their own hearts; and have obtained from it a certain assurance that it comes from God.

4. *By Evidences.*—If any reader will not accept the Bible upon the testimonies of others; if he fails to see in its behalf the weight of probability; if he has not been able to put it to the test in his own experience, there is yet a strong line of argument appealing to his reason, and proving the book divine.

VIII. *We find this divine revelation searched:*

1. *Through Curiosity.*—There are some who read and study the Bible from no higher motive than desire to know its contents.

2. *Through Literary Taste.*—There are others who read the Bible from an appreciation of its value as a work of literature, recognizing the high poetic rank of David and Isaiah, the historic worth of Joshua and Samuel, the philosophic thought of Paul.

3. *Through Opposition.*—In every age there have been searchers of the Bible actuated by the motive of unbelief; men trying to find in it the weapons for its own destruction.

Yet even their study has often proved serviceable to the believer in the divine revelation.

4. *Through Spiritual Desire.*—Multitudes have studied the Bible, multitudes are studying it now because they find in it that which their spiritual nature craves, the knowledge of God. They feed upon the Word because it satisfies the hunger of their spirits.

IX. We find this *divine revelation circulated among men.* The history of the Bible since its translation into English has been the history of multiplication. Language after language has had the Bible added to the library of its language. Unwritten languages have had characters invented for them to represent their words and the Bible has thus become the first book of the new-made written language of the people. All the leading languages of the world have thus been put in possession of the Bible, and the signs of the times point to a speedy realization of the hope that soon all the nations of the earth will know the divine revelation of our Father which is in heaven.

CHAUTAUQUA NORMAL CLASS.

Twelve Lessons on the Sunday-school and the Teacher's Work.

LESSON I.—THE PLACE, PURPOSE AND PREROGATIVES OF THE SUNDAY-SCHOOL.

I. The place of the Sunday-school.

1. The Sunday-school is one of the means employed by the Church of Christ for bringing men under the influence of the Gospel. It is not designed to fill the place of any of the other accepted agencies of the church.

2. The Sunday-school does not, and should not accomplish the work belonging to the pulpit and the pastor, nor does it subserve the purpose of the church meeting for prayer and interchange of Christian experience.

3. The Sunday-school can in no sense do the work of the Christian home. It is an agency differing from all other agencies of the church, and is made necessary by the nature and extent of the body of truth accepted by the church, so necessary that without it the church would be to a certain extent crippled.

4. It is a school, *organized and officered as such*; occupying a well defined place in the religious system of the church, having a specific purpose, and entitled to certain prerogatives.

5. As a school, its constituency is a body of teachers and pupils, associated together voluntarily, but not without responsibility and accountability.

6. The Sunday-school in its theoretic constitution is the parallel of the secular school.

(a) As the latter derives its life from the community, so the Sunday-school derives its life from *the religious community, the church.*

(b) As the community delegates the power of control over the secular school to a representative body which exercises supreme authority over its affairs, so the church entrusts the management of the Sunday-school to her representative executive body, by whatever name known.

(c) As the representative body controlling the secular school places the oversight of the system and its details of management in the hands of a general executive officer, or superintendent, so the governing power of the church entrusts the management of the Sunday-school to one of similar name—a *superintendent.*

(d) As the secular school is within and subordinate to the community, and alongside of the home as its aid and supplement, so the Sunday-school is within and subordinate to the church, and beside the Christian home as its supplement.

Let us gather up these propositions concerning the Sunday-school into a general definition.

Definition.

The Sunday-school is a department of the church of Christ, in which the word of Christ is taught for the purpose of bringing souls to Christ and building up souls in Christ.

As suggested by this definition, we make the following propositions:

- (1) The Sunday-school is a *school.*
- (2) The Sunday-school is not a substitute for the church.
- (3) The Sunday-school is not a substitute for the prayer meeting.
- (4) The Sunday-school is not a substitute for home training.
- (5) The Sunday-school is *in* the church as an integral part.
- (6) The Sunday-school is subordinate to the church.
- (7) The Sunday-school is an aid to the Christian home.

II. The Purpose of the Sunday-school.

1. The chief purpose of the Sunday-school is the *spiritual education* of the soul. By education we do not mean the mere putting in possession of knowledge. There have been learned men who were not educated men; men of wide knowledge, but with the power of *self-control* and *self-use* undeveloped. By education we mean leading the soul out of its natural condition, into a condition where it can do what God meant it to do, and be what God meant it to be. Spiritual education will therefore be the development of a soul by nature averse to divine control, into a condition of oneness with the divine will, such as is made possible by the at-onement of Jesus Christ. This process involves, (1) conversion, and (2) upbuilding in Christ, and would produce, if unhindered, a character that would reach toward the measure of the fulness of Christ.

But many souls in the church have never reached farther than the first or preparatory step in spiritual education—the step which we call conversion. Hence,

2. A second purpose of the Sunday-school is upbuilding in Christ, and this is possible only through searching study of the Word of God.

As the astronomer must know all the intricacies of his science, and be able with the telescope to read the heavens as an open book, and scan their farthest depths, so the Christian must know the hidden mysteries and deep things of God as revealed in the Bible, which is both text-book and telescope to the soul.

3. A third purpose of the Sunday-school is the development of the teaching power in the church. "Go teach," in the Revised version becomes "Go disciple." Sunday-school teaching therefore becomes *disciple-making.* In this respect its aim is the same as that of the church. To accomplish it by preaching, the church provides years of careful training for her ministers in special schools. As careful training is needed by the Sunday-school teacher, and the school itself is the only means by which the end can be secured.

III. The Prerogatives of the Sunday-school.

The Sunday-school exists within the church and because of the church. Yet though a part of the church, it maintains a separate organic life. As a member of the body it has certain *rights* which we call Prerogatives. We name the most important.

1. *Care.*—As no member of the body can be neglected without physical loss, so if any part of the body of Christ be left without watchful care, spiritual loss must ensue. The Sunday-school has a *right to the care* of the church, exercised (a) officially by the governing body, that no want may be left unsupplied, and (b) individually that sympathy, help, prayer and interest may never be lacking, and that ample provision may be made for the efficient working of the school.

2. *Support.*—The Sunday-school has a right to the pecuniary support of the church. It never should be crippled by lack of means to carry out its plans. The school should not be expected to provide for its own necessary expenses. The voluntary contributions of the school should never be applied to the support of the school as such. Systematic giving should be taught, and should include all the benevolent operations of the church, even to the extent of contributing toward the general church expenses, but that the school should use its funds for defraying its own expenses is clearly an evil.

(3) *Recognition*.—The school has a right to be recognized as an established agency of the church. This recognition should include (1) regular notice from the pulpit of the time and place of holding its sessions; (2) the same prominence to the annual meeting for the choice of officers that is given to the same meetings of the church, and (3) its importance as a church agency should be recognized by giving to the school official recognition in the governing body of the church.

(4) *Pastoral Supervision*.—The school has a right to the watchful oversight and regular presence of the pastor. It is not necessary that he should superintend the school—it is better not. It is not necessary that he should be burdened with its cares. But it is essential (1) that he use it as a field of pastoral labor; (2) that he give to it the encouragement of his commendation; (3) that he extend to it the sympathy of his

presence; (4) that he know as to the character of the work being done within it.

(5) *Coöperation*.—The Sunday-school has a right to the hearty coöperation of the whole church, so that (1) there may be no lack of teachers to do the work of the school, and (2) that the work of the teacher may be understood and appreciated in the Christian family, which is the church unit; and (3) that teacher and parent may work in perfect harmony.

This is not intended as an exhaustive treatment of this subject. It presents in outline some salient points concerning the Sunday-school, and leaves the student to continue by himself the line of thought suggested, and to this end reference is made to "Hart's Thoughts on Sunday-schools," "Pardee's Sunday-school Index," and the "Chautauqua Normal Guide," by J. H. Vincent, D.D., 1880.

EDITOR'S OUTLOOK.

DR. HAYGOOD'S BATTLE FOR THE NEGRO.

There is something sublime in the spectacle of an earnest man contending for his cause. The sublimity is heightened when we remember that his cause and his convictions are identical, without any reckoning of the cost. Of this character was the figure of Dr. Atticus G. Haygood on the Chautauqua platform, uttering brave words for the Negro, his former slave, but present fellow-citizen. Nor did we have to wait till opportunity made him heard at Chautauqua. From the close of the war until now, he has been a moulder and leader of the best sentiment in the South, and has occupied advanced ground upon all questions relating to the education and welfare of the liberated slave. His recent book, "Our Brother in Black," is the ablest contribution we have had to the "Negro question." It breathes throughout the same generous, Christian sentiment and sympathy that characterize all his utterances and his work elsewhere. Nor is the word "battle" too strong a term to be used. When we remember the jealousies, hates, and prejudices of long standing, and greatly intensified by the war; and how they have been kept alive by designing men on both sides; when we bear these things in mind, it is easy to see that it has required no little courage for a Southern man, in the midst of Southern people, with their sentiments and feelings, to take up the black man's cause and advocate it in words of bold, plain truth.

Dr. Haygood is the Christian, and not the politician. When he praises, as he does without stint, the work accomplished for the Negro by the people of the North, it is not the work of that particular politician, with his promise of "a mule, forty acres, and provisions for a year," but of teachers, secular and religious, who, with a motive higher than the personal, have sought the elevation, moral and intellectual, of the Negro. He pleads no apology for his Southern brethren who have met these benevolent workers with opposition, social ostracism, and other forms of persecution, but utters his condemnation of this spirit whenever and wherever manifested.

And the results of the first twenty years' history have justified his high and hopeful views. It is only two years since Senator Brown, of Georgia, said of the Negro, in a speech delivered in the United States Senate: "He has shown a capacity to receive education, and a disposition to elevate himself that is exceedingly gratifying, not only to me, but to every right-thinking Southern man." The results show that the Negro has a real hunger for the education he so greatly needs. It is shown that in the year 1881, forty-seven per cent. of the colored school population was enrolled as attending the public schools, whilst in the same year there was enrolled fifty-two per cent. of the white population. Though both figures are painfully low, and suggest a condition of great illiteracy, yet, when we remember the past

of the Negro—how he has been trampled down and trodden under—the figure 47 at the end of his first twenty years, is both encouraging and significant.

But Dr. Haygood finds his strongest hope in the religious nature of the Negro. The religious element of the race was very manifest in the days of slavery, and since its freedom still more so. The moral and religious progress of twenty years is encouraging. Of seven millions, the entire colored population, a million and a half are communicants of the various churches. Whilst their notions are crude, their conceptions of religious truth often painfully realistic and grotesque, yet their religion is real and worthy of confidence. More than to all other influences combined, to the black man's religion is due the shaping of his better character. It is from this basis, and working along this line, that Dr. Haygood sees the success of the future. His closing word at Chautauqua is a statement of the whole theory which will commend itself to the sympathy and judgment of right-thinking Christian men everywhere: "Mere statesmanship can not solve this hard problem. It is not given to the wisdom of man; but God reigns, and God does not fail. We are workers with him in his great designs. When we stand by the cross of Jesus Christ we will know what to do. We can solve our problem, God being our helper. But on no lower platform than this—the platform of the Ten Commandments and of the Sermon on the Mount."

THE POLITICAL OUTLOOK.

In a few months we shall be in the midst of another presidential campaign, and one as exciting, perhaps, as the country has known. Already we see earnest preparations for the fray. The party managers are busily laying their schemes; the question of candidates and the measures to secure victory are being thoroughly canvassed by the rival parties.

What now strikes the thoughtful person as he considers the political outlook is the lack of party issues. Two great parties are seen on the eve of a tremendous struggle for the reins of government; but when the question is asked, what are the living issues at the bottom of this fight? one is puzzled for a reply. The situation is about this: instead of coming before the people with certain great principles as a ground of contention, one party has for its cry, "Put the rascals out;" and the other, "Let us keep the rascals from coming in."

Our feeling is that the case should be different. Are there no living issues important enough to serve as the rallying cry of political parties? Must parties live on a past record? Is there nothing for them to do but to glory in what they have done, and point a finger of contempt at the other side? By no means is this the case. There are to-day vitally important matters pertaining to the public welfare which call loudly to our

political leaders for attention; and the party which shall take hold of these matters in an earnest way, and boldly present itself as the champion of principles of truth and justice and purity, ought to be, and must be, the party of the future.

The reform of the civil service might very well be a party issue, but it is not. Neither of the great parties shows a disposition to take a hearty and united stand in favor of such reform. Some prominent men in both parties have it at heart, and the movement which has been seen can not be claimed as a party movement. The reform of the tariff wise men see to be one of the crying needs of the hour; but how hopelessly at sea seem our party leaders in dealing with the question. It can not be said that any principles of tariff are a party issue. There is a wide diversity of sentiment among those who have the management of the parties; on either side are seen free-trade men and protective tariff men; and probably some have their opinions yet to form upon a subject so live and important as the tariff. The nation has a yearly surplus revenue of \$100,000,000, to get rid of which extravagant and needless appropriations are made; the embarrassment of certain branches of industry in our land, as things are, is evident; but to which party can we point as the one intelligently and earnestly bent on tariff reform? The time may come when the prohibition of the liquor traffic will be the underlying principle of a great political party, but it is not now. We may have our opinions as to which of the great parties bidding for the suffrages of the people is the more a temperance party, but either is a great way from being ready to adopt as an issue the righteous principle of prohibition. In just one State to-day (Iowa), one of the parties appears as the supporter of this principle. Turn to another State (Massachusetts), which sometimes is thought to lead all the rest in moral ideas, and see the same party fighting neither for this principle nor any other, but simply to wrest the power from Governor Butler.

We judge of the coming national campaign by that now in progress in different States, and we see it is to be marked by a lack of high and worthy party issues. It will be—what it should not be—a contest without great underlying principles. Let whichever party may triumph, the victory can not be regarded one of living principles; it will be rather the success of individuals to whom the majority of the people choose to commit the reins of authority, or the triumph of a party which the people prefer for its record, or to which they give a blind and unthinking preference. Whatever the outcome of the impending political struggle, we have faith in the perpetuity of our institutions, and that there is a nobler destiny for the American people than they have yet attained.

HISTORY OF GREECE.

The installment of Grecian History required in the C. L. S. C. course is not extensive, but has been prepared with much care, and is adapted to its purpose. A careful study—enough to give possession of the principal facts stated, can hardly fail to kindle the desire for further knowledge of a people who had so many elements of greatness, and for centuries surpassed all others in knowledge and culture. The most advanced nations of to-day are largely indebted to the Greeks. Modern art and literature bear witness to the indebtedness. The race had wonderful capabilities. Their country, climate, blood, early habits of self-control, or all these together, secured in that corner of Europe a class of stalwart men, physically and intellectually capable of great deeds.

Much of their early history is, of course, fabulous. The gods, goddesses, heroes and kings, whose councils and exploits are rehearsed, were but myths. Yet the legendary traditions respecting them have charms that attract and hold the reader. We may utterly discredit the story, but pay homage to the ability and versatile genius of the writer, whose glowing words so paint the scenes described. Only a slight basis of fact is conceded to some of the most captivating Homeric descriptions;

yet they are in an important sense true. False in history, but sublimely true to the conceptions of the greatest of poets, as a bold delineator, peerless in his own, or any other age. If the ideal of the divinities thought to be interested in the affairs of men falls far below the conceptions of a monotheist, and seems unworthy of a philanthropic heathen, the portraiture is both complete and captivating.

When the mists, that for centuries shrouded Greece and the neighboring isles, are dispersed, and we recognize the certain dawn of the *historic* period, though the descendants of those mighty heroes and kings that were deified as sons of the gods, shrink to the proportions of men, they are still found to be mighty men, whose noble deeds and achievements have been an inspiration to millions in the generations since. Excepting only such as have the true light, and are blest with Christian civilization, we adopt the statement "No other race ever did so many things well as the Greeks."

Let the book be closely studied. If the cursory, objectless reader lacks interest, and tires in the work, the student feels more than compensated for his toil.

A COLLEGE REFORM.

The present agitation touching college courses of study is one from which good is likely to come. There is danger, however, that we swing to the other extreme. That undue prominence in the ordinary college curriculum has hitherto been given to classical studies, and too little room made for the modern languages, natural science, and English literature is coming to be widely felt. But the true reform is not utterly to eliminate the classics; it is not the part of wisdom to decry as folly the study of the dead tongues.

The oration of Charles Francis Adams, Jr., last summer at Harvard, published under the title of "A College Fetich," was quite as unexpected and sensational as that of Wendell Phillips on another similar occasion. Mr. Phillips arraigned his *alma mater* that her sons were no more active in social reforms, while Mr. Adams charged upon her that, in retaining the dead languages as a required part of the course of study, she was guilty of worshipping a fetich. This grandson and great-grandson of a President, whose illustrious ancestors one after another were inmates of Harvard's halls, makes against the venerable institution, the most serious charge that her graduates, upon leaving her, are not fitted as they should be for practical life. She sends them forth, he affirms, with a smattering of the dead languages, which is quite without advantage, instead of with a thorough knowledge of what can be turned to practical account and will qualify them for the duties of active life. He would have a drill in the classics no longer required of the college student; but would allow him to win his A. B. by pursuing other and more useful branches of study. Mr. Adams's bold claim against Harvard, if sustained, would of course hold against other colleges, and against some others would hold in a higher degree.

But we think his statements are too sweeping, and the reform he advocates, because it goes too far, would not be a wise reform. We would not abolish the study of Latin and Greek in our colleges. They are dead tongues, but it does not follow that time spent in their study is wasted. On the contrary, we would have them taught with such thoroughness, by such qualified and skillful teachers that the college graduate will go out with something more than a smattering of them. It is a fact which can not be disproved, that from a study of the classics comes a mental discipline and a mastery of good English, such as can be acquired from nothing else. But that too much comparative attention has been given to these branches is freely conceded. There is a want of more thorough study in our higher institutions of the natural science, the modern tongues, and the models of our own language. The true reform is to cease to magnify Latin and Greek at the expense of these other things, and to give to the latter their due attention. Of the

wisdom of elective college courses there can be no doubt. It may not be always best for the young man who has not in view one of the learned professions, but a business life, to spend years in the study of the ancient languages. But it is our judgment that a knowledge of these should always be required of the candidate for the Bachelor of Art's degree. Certain things

are in the air, and we rejoice. Natural science, that field of study in richness so exhaustless, is attracting the student as never before. The importance of gaining a knowledge of languages now spoken, other than our own, is being felt as it was not once. We welcome the indications that promise a college reform. Let us have it without over-shooting the mark.

EDITOR'S NOTE-BOOK.

The trustees of the Garfield monument to be erected in Cleveland, Ohio, have more than one hundred and thirty thousand dollars on hand, and they expect to secure a sufficient increase to this sum, at an early day, to complete the work. This, with the fund of more than three hundred thousand dollars which the American people contributed and presented to the widow of the lamented Garfield, is positive proof that our republic is not ungrateful.

The old statement that a low grade of moral character may exist in the same community with a high grade of mental culture may be true of any type of the best modern civilizations, but it is not necessarily true. Education, like the gospel, may be the savor of death unto death, but moral death need not be its effect. A good illustration of the elevating tendencies of education in the community is found in the fact that since the compulsory school law went into operation in New York, juvenile crime in that city has been reduced by more than thirty-six per cent. And yet it is said the law has been only partially enforced.

Scientific temperance education has been by legislative action introduced into the public schools of Vermont and Michigan, and at the last session of the legislature in New Hampshire it was by a unanimous vote introduced into the schools of that State. The W. C. T. U. is laying its hand on legislatures in a very effective way, and we may look for an abundant harvest in the next generation. "Long voyages make rich returns."

Prince Bismarck is a timber merchant, and why should not a dealer in timber be called a merchant? But this is not all. He is a large distiller of spirituous liquors. The Germans do not object to his occupation as a distiller, for their drinking customs are on a low grade. Public opinion, in this country, would not long tolerate a statesman, even of great abilities, who manufactured distilled liquors for sale as a beverage. And herein we see one point of difference between these two nations on a great moral reform.

The *Scientific American* of a recent date says: "Too much reliance is placed on the sense of taste, sight and smell in determining the character of drinking water. It is a fact which has been repeatedly illustrated that water may be odorless, tasteless and colorless, and yet be full of danger to those who use it. The recent outbreak of typhoid fever in Newburg, N. Y., is an example, having been caused by water which was clear, and without taste or smell. It is also a fact that even a chemical analysis sometimes will fail to show a dangerous contamination of the water, and will always fail to detect the specific poison if the water is infected with discharges of an infectious nature. It is therefore urged that the source of the water supply should be kept free from all possible means of contamination by sewage. It is only in the knowledge of perfect cleanliness that safety is guaranteed."

Mr. Henry Hart, of Brockport, N. Y., manufactures a C. L.

S. C. gold pin of beautiful design for gentlemen, and another one attached to an arrow, which is equally handsome, for ladies. Either one makes an appropriate badge for members of the Circle to wear in everyday life, and at times it will serve to introduce strangers when traveling or in strange places, who have a common sympathy in a great work, and thus aid the possessor in extending his circle of acquaintances.

One of the most embarrassing questions in the management of colleges and universities is, how shall trustees superannuate a certain class of professors, whose days of usefulness in the recitation room are past. When that problem is solved the unity and peace of the management will, as a rule, be secured.

The New York *Herald* is led to pronounce against capital punishment because in many cases the law against murder is a dead letter, and produces the following historical reference to confirm the statement: "It appears that from 1860 to 1882 a hundred and seventy persons were tried in Massachusetts for murder in the first degree. Of this number only twenty-nine were convicted, and only sixteen paid the extreme penalty of the law. Of those convicted one committed suicide, and twelve got their sentences commuted. Here, then, during a period of little more than twenty years were a hundred and seventy murders in one State, and only sixteen executions."

They have one hundred and fifty miles of electric railway in operation in Europe. Active preparations are making by rival inventors and corporations in New York city to introduce electricity on a large scale as a safe, rapid, and cheap motor. As in lighting houses, towns, and cities we have passed from the tallow candle to kerosene, and then to gas, and on to the electric light, so by many steps and advances we are almost ready to accept electricity as the moving power of railway trains.

The pardoning power of the general government is liable to work pernicious results in the regular army. Cases of embezzlement and fraud among army officers have been growing in number since our civil war, and laxity in the enforcement of the laws against these offenders is a growing evil. General J. B. Fry, an officer of repute, and a graduate of West Point, thus points out the evil: "The interposition of higher authority in favor of offenders has been so frequent since the war, especially from 1876 to 1880, as to be a great injury to the service. Many of the evils which have been exposed recently are fairly chargeable to executive and legislative reversal of army action."

* * * When the strong current of military justice is dammed by the authorities set over the army, stagnant pools are formed which breed scandal, fraud, disobedience, dissipation, and disgrace, sometimes even among those educated for the service."

Cable intelligence, received September 3, shows that the Baron Nordenskjöld, as a Greenland explorer, has accomplished a large part of his original purpose. The expedition entered West Greenland in latitude 68°, and proceeded 220 miles inland.

attained an altitude of seven thousand feet above the sea level. In 1878 Lieutenant Jansen, of the Danish navy, penetrated fifty miles from the coast, and reached an "icy mountain, in lat. 62° 40', five thousand feet high." But no explorer has since done anything worth mention toward solving the mystery of Greenland's interior physical geography. The expedition with Professor Nordenskjöld has gone farther and seen more of the "immense desert of ice;" and the latest telegrams claim that some important scientific data have been obtained.

The prohibition amendment, submitted to the voters of Ohio, is defeated, and our cherished hopes of its success, for the present, sadly disappointed. The non-partisan temperance people, everywhere, felt deeply interested in the issue, and will hear the result with profound sorrow. Multitudes of Ohio's best men and women, who had prayed, worked, and hoped that deliverance might come in that way, and that from the 9th of October we would see the unspeakable curse of the liquor traffic placed where it ought to be, under the ban of the constitution, from which corrupt tinkering politicians would be unable to protect it, will confess their disappointment, but neither suppress their prayers nor cease their efforts. They are clearly in the majority, and when united will succeed.

Telegraphic report says the Vicar of Stratford has authorized the exhumation of the remains of Shakspeare that they may compare the skull with the bust that stands over the grave. Dr. Ingleby, of London, who is a trustee of the Shakspeare Museum at Stratford, wishes, it seems, to photograph the face and take a cast of the skull. The absurdity of the proposal makes it almost incredible, and should itself prevent the desecration. We are not surprised that the bishop and local authorities have protested, and the intended outrage will hardly be perpetrated. By the terms of the deed of interment the consent of the Mayor of Stratford-on-Avon must first be given before the body can be moved. To this proposal, that official has given a decided refusal, and the dust of the poet will not be disturbed. Shakspeare has been dead two hundred and sixty-seven years. The type of face and head, universally accepted as his, is sufficiently accurate. If it were not the correction of any fault in that likeness is now impossible.

The Pittsburgh Exposition building, with most of its contents, was entirely consumed by fire during the exposition week. The principal loss was the goods on exhibition, including many articles of exquisite workmanship, and valuable relics that can not be replaced. The building itself, though a wooden structure, was large, and seemed suitable for the purpose. It was valued at \$150,000 and not heavily insured. Perhaps sufficient care was not taken to secure the property against the calamity that, in so short a time, destroyed the whole. The company, who had before suffered some reverses and losses, and were struggling into what seemed a safe condition, with hopes of future prosperity, have the sympathy of the public.

During the last decade, and especially since the great Centennial, expositions have been numerous, and, in many cases, attended with most gratifying results. When the associations providing them are controlled by men of culture, they are generously sustained. The articles they have to exhibit are not only numerous, but in kind and quality, worthy of our advanced civilization. These American expositions are becoming notably rich in manufactured articles, and in the extent and variety of useful machinery. For inventive genius the Yankee nation is unrivaled, while in the mechanical execution of the designs our skilled artisans have few, if any, superiors. In the principal western cities the holding of at least annual expositions is no longer a tentative measure. The institutions are established, and their continuance, in most cases, pretty well assured. An example of these is the "Detroit Art and Loan

Exposition" of recent origin. Already it has fair proportions, being from the commencement, in most respects, equal to the best. Evidently the project for having there a creditable, first-class exposition was clearly conceived, generously sustained, and most successfully executed.

Before Congress opens General W. T. Sherman will close up the affairs of his office, and General Sheridan will succeed him as commander of the United States Army. General Sherman has made a good officer, but his reputation in history will rest chiefly on his bravery and skill as a general in his famous march to the sea. The Sherman family have served their country well. John Sherman, in the Senate, and as Secretary of the Treasury, in times when great abilities were in demand, has made a name as great in his line as the general in the army.

The receipts of the great Brooklyn bridge for nineteen weeks from the opening, were: For passengers, \$34,464; for vehicles, \$31,563; for cars, \$3,936. Total receipts, \$69,163. The average per day was \$526.04. The total expenses during the nineteen weeks were \$51,418.08.

The C. L. S. C. continues to grow with great rapidity in all parts of the country. There is no sign of the interest waning in any community from which we have heard. From Plainfield, N. J., the central office, we receive news that the new class will be the largest of our history. New England is rolling up a large membership. All over the West and Northwest there is an interest among the people amounting to enthusiasm. Mr. Lewis Peake, of Toronto, reports a C. L. S. C. revival in Canada. This is the time to circulate C. L. S. C. circulars, and to use your town, city, and county papers to call the attention of the people to the aims and methods of work. By these means a C. L. S. C. fire may be kindled on every street in every town and city in the land.

The recent pastoral letter of the Cardinal and other high officials in the Romish Church, caused a reporter to ask one of these officers some questions about marriage and divorce, to which he replied as follows. It is wholesome truth: "Marriage is a divine institution, and the Catholic Church under no circumstances whatever permits the sacred contract to be broken." To the question, "Is there no such thing as separation between husband and wife recognized in the Catholic Church?" he answered: "Separation, yes, for the gravest reasons and under restrictions that do not admit of the remarriage of either of the parties to the original contract while both are living. But divorce in the sense generally accepted, never. Rather than permit divorce, the Church let England separate from the Holy See. The same question was raised by the first Napoleon, and it was ruled against him by the Pope. You will find that if anything bearing the appearance of divorce has been allowed in the Catholic Church, it has always been a case where the most careful investigation showed that the marriage was originally invalid."

The Germans on October 8 in many towns and cities celebrated the bi-centennial of the arrival of the first German immigrants in this country, on the ship "Concord." Their singing, secret, and literary societies paraded in regalia, with banners and music. It was a notable day among the Germans of America.

Bishop Paddock, of the Protestant Episcopal Church, in charge of the diocese of Washington Territory, when speaking of his field of labor before the Episcopal Council in Philadelphia last month, said: "I am decidedly opposed to separating the colored people in their worship from the whites."

We learn from an exchange that the authorities of the Erie

Railway have decided to discharge every employe who uses liquor as a beverage, whether he gets drunk or not. It is plain that for the safety of passengers a drinking man should not be entrusted with an engine, the care of a switch, with messages as a telegraph operator, or as a superintendent in charge of a division.

The Methodists of Canada have eliminated the words "serve" and "obey" from the woman's part of the marriage ceremony. Even the argument that the New Testament enjoins this kind of obedience on wives, did not preserve the words in the ritual. We congratulate the wives on the change.

Professor W. F. Sherwin has been appointed by Dr. E. Tourjee chorus director in that prosperous institution, the New England Conservatory of Music, in Boston, Massachusetts. The Professor will make Boston his home, and continue to lecture and conduct musical conventions, as heretofore.

The Cooper Union was crowded one evening last month to welcome Francis Murphy home from England and his own native Ireland. Judge Noah Davis presided and delivered the address of welcome. "In speaking of Mr. Murphy's work in England and Scotland he quoted the statistics of the United Kingdom to prove that Mr. Murphy's efforts had been effectual in reducing the excise revenues many thousands of pounds sterling. He said that during his two years' stay in England and Scotland he had obtained half a million signers to the pledge. Mr. Murphy responded in a few brief words, declaring that the occasion was the happiest of his whole life. A number of short addresses were made by clergymen, and with the singing of songs and choruses, in which the whole assembly engaged, the ceremonies were prolonged until about half-past ten o'clock."

The C. L. S. C. is rapidly becoming an established institution among New England people. This is to be accounted for in part by the fact that the religious press of Boston and other New England cities has favored the work with earnest, strong words. The Rev. Dr. B. K. Pierce, editor of *Zion's Herald*, closes a leading editorial on the C. L. S. C., in his paper of a recent date, with these words: "There is another reason why we look with great satisfaction upon this widely-extended home-university. We have fallen upon an era of doubt. The literature of the hour is full of sneers at revealed religion and of arrogant and destructive criticism upon the Holy Scriptures. The daily, weekly and monthly press is strongly flavored with this. Our young people breathe it in the atmosphere of the school and of

the streets. Here is one of the best, silent, powerful, positive correctives. This carefully-arranged plan of study and reading for successive years is entirely in the interest of the 'truth as it is in Jesus.' It is not narrow, nor dogmatic, nor polemical, nor confined to purely religious subjects, but the whole system is arranged and followed out upon the presumption of the inspiration of the Bible, the divine origin of Christianity, and its ultimate triumph upon the earth. It will powerfully strengthen the faith of young Christians, preserve them from the insidious attacks of infidelity, and enable them to have, and to give to any serious inquirer, an answer for the hope that is in them."

The jury system has some glaring defects which should be laid bare and made the subject of agitation till they are corrected. Recently in a famous bribery case (so called) at Albany, N. Y., when jurors were being called and questioned, one of them said, "I don't know who were the United States Senators two years ago from New York." Yet this ignorant man was accepted as a juror. This is a common custom in the selection of jurors. It is exalting ignorance at the expense of intelligence and justice. Some remedy should be found for this growing and terrible evil.

A new field of artistic ability is being developed in the East. It is the decoration of the interior of private residences. Already in New York a number of young artists, who find it difficult to sell all the pictures they paint, are giving their attention to this work, which promises to be very remunerative and very extensive.

The Chicago agency of Alice H. Birch has been abandoned, and her old patrons may order any game previously advertised by her, at her home, Portland, Traill Co., Dakota.

The Commissioner of Education has prepared a table showing the illiteracy among voters in the South, which presents a painfully interesting study for educators and statesmen. In the formerly slaveholding States there are 4,154,125 men legally entitled to vote. Of these, 409,563 whites, and 982,804 colored, are unable to write even their names, and their ability to read is very limited. Many, who profess to be able to read, can only with difficulty spell out a few simple sentences in their primers, and really get no knowledge, such as the citizen needs, from either books or papers. Thousands of them have neither books nor papers, and could not read them if they had. Surely a great work must be done for these freed men and poor whites before they are quite equal to all the duties of citizens in a country like ours.

EDITOR'S TABLE.

Q. Dec'orus or deco'rus, which?

A. Webster authorizes both, giving preference to the latter. The former has the advantage of placing the accent on the root syllable, a rule that is very helpful in settling questions of pronunciation, and conforms to usage in the accentuation of cognate words, as "dec'orate," "dec'oration," etc. We prefer it.

Q. What is the meaning of "liberal," in the phrases, "liberal education," and "liberal religious views?"

A. An education extended much beyond the practical necessities of our every-day business and social life, is liberal. It is not a possession belonging alone to the alumni of colleges and universities. Any person of culture, who, with or without the aid of teachers, has mastered the curriculum of studies prescribed by colleges, or its equivalent, is liberally educated. In the best sense, a man of "liberal religious views" is generous,

freely according to others the right to their opinions on all subjects about which good men may differ. He is not creedless, but not bigoted; and cordially approves "things that are most excellent," wherever they are found. The claim to great liberality, set up by those who have no rule of faith, and no views they are willing to formulate, does not seem well founded.

Q. Where is the line, "Far from the madding crowd's ignoble strife" found? and should not the word "madding" be "maddening?"

A. The line is from Gray's *Elegy* (73). The adjective "mad" is made a causative verb, without the usual suffix, "en." We do not find the form in prose, and would not use it.

Q. Are there any books purporting to prove scientifically the immortality of the soul?

A. If by "scientifically," the querist means, as we suppose,

rationality, philosophically, our answer is, yes, very many. More books have been written upon this one subject than one could read carefully in a lifetime. Several thousand distinct works, written in Greek, Latin, English, and the principal languages of Europe, have been catalogued by Ezra Abbott. The catalogue itself, published as an appendix to Alger's "Doctrine of a Future Life," would make a respectable volume, containing, as it does, a list of more than five thousand books, by almost as many authors, who discuss, more or less satisfactorily, the great problem of the soul. Some propose, not argument, but only a history of the doctrine of a future, immortal life as held by the different races of men, with various shades of opinion respecting it. Some doubt, some disbelieve, and some, discarding all rational processes, accept the dogma as a matter of faith alone, lying beyond the field of our reason. But many Christian writers, thankful for the "more sure word of prophecy," and that "life and immortality are brought to light by the gospel," hold also that outside the realm of faith, it is a fit subject for rational investigation, and as capable of proof or demonstration as other moral and psychical problems. Perhaps most of the works named in the catalogue consulted, treat of the soul and its immortality in connection with other principles and facts of the religious systems accepted by the authors, and are too voluminous for common use. Drew's "Essay on the Immateriality and Immortality of the Soul" founded wholly on psychological and rational principles

is regarded a masterpiece of metaphysical argument—clear, logical, satisfactory.

Q. Is the expression "as though" ever correct?

A. "Though" is often used in English, taking the place of the conditional *if*, especially in the phrases *as though* and *what though*, which interchange with *as if* and *what if*; e. g.:

"If she bid me pack, I'll give her thanks *as though* she bid me stay by her a week."—*Shakspeare*.

"A Tartar, who looked *as though* the speed of thought were in his limbs."—*Byron*.

Other examples need not be given. These approve the expression as correct, though not much used at present.

Q. Will the firing of cannon over water bring a dead body at the bottom to the surface; if so, why, or how?

A. The concussion or violent agitation of the water may loosen a body slightly held at the bottom, when, if specifically lighter than water, it will rise.

Q. In "Recreations in Astronomy," p. 163, it is said 192 asteroids have been discovered, with diameters from 20 to 400 miles; and on the next page it is "estimated" that if all these were put into one planet, it would not be over 400 miles in diameter. How can that be?

A. Allowing, as the author does, that the density of the masses remains the same, it would, of course, be impossible. We have not the means at hand to either verify or correct the diameters given, and can not locate the error.

C. L. S. C. NOTES ON REQUIRED READINGS FOR NOVEMBER.

TIMAYENIS'S HISTORY OF GREECE.

PARTS IO AND II.

P. 258.—"Mummius," mum'mi-us. See Timayenis, p. 251, vol. II. "Delos," de'los.

"Mithradatic," mith'ra-da'tic. For history of Mithradates see Timayenis, vol. II., p. 254.

P. 259.—"Sulla," sul'la. (B. C. 138-78). A Roman general, the rival of Marius. After the close of this war Sulla went to Italy, defeated the Marian party and issued a proscription by which many thousands of his enemies perished. For the two years following he held the office of dictator, which in 79 he resigned to retire to private life.

"Epidaurus," ep'i-dau'rus. One of the most magnificent temples in all Greece, that of the god Æsculapius, was situated there.

"Peiræan," pei-ræ'an. Through this gate ran the road to the Piræus, and at the Sacred Gate began the sacred road to Eleusis where the festivals and mysteries were celebrated.

"Bithynia," bi-thyn'i-a; "Kappadokia," cap'pa-do'ci-a; "Paphlagonia," paph'la-go'ni-a.

P. 260.—"Chrysostom," kris'os-tom. See Timayenis, vol. II., 319 sq. "Anthemius," an-the'mi-us; "Isidorus," is'i-do'rus. Eminent architects.

P. 261.—"Pompey," (B. C. 106-48.) Pompey had been a successful general from early life, receiving from Sulla the surname of Magnus.

P. 262.—"Soli," so'li. The word solecism (to speak incorrectly) is said to have been first used in regard to the dialect of the inhabitants of this city.

"Pompeiopolis," pom'pe-i-op'o-lis; "Armenia," ar-me'ni-a.

"Tigranes," ti-gra'nes. The king of Armenia from B. C. 96-55. He was an ally of Mithradates until this invasion by Pompey, when he hastened to submit to the latter, thus winning favor and receiving the kingdom with the title of king.

P. 263.—"Phillippi," phil-lip'pi; "Octavius," oc-ta'vi-us.

"Philhellenist," phil-hel'len-ist. A friend to Greece.

"Philathenian," phil-a-the'ni-an. A friend to Athens.

"Actium," ac'ti-um.

P. 264.—"Ægina," æ-gi'na; "Eretria," e-re'tri-a.

"Stoa," sto'a. Halls or porches supported by pillars, and used as places of resort in the heat of the day.

"Athene Archegetes," a-the'ne ar-cheg'e-tes; "Peisistratus," pi-sis'-tra-tus; "Nikopolis," ni-cop'o-lis.

P. 265.—"Cæsarean," cæ-sa're-an.

"Seneca," (B. C. 5?-A. D. 65.) A Roman Stoic philosopher. The tutor and afterward adviser of Nero. When the excesses of the latter had made Seneca's presence irksome to him, he was dismissed and soon after, by order of Nero, put to death. His writings were mainly philosophical treatises.

"Agrippina," ag-rip-pi'na. Nero was the son of Agrippina by her first husband. On her marriage with her third husband, the Emperor Claudius, she prevailed upon the latter to adopt Nero as his son. In order to secure the succession she murdered Claudius and governed the empire in Nero's name until he, tired of her authority, caused her to be put to death.

"Isthmian," is'ml-an; "Pythian," pyth'i-an; "Nemean," ne'me-an; "Olympian," o-lym'pi-an. See author for accounts of these games.

"Pythia," pyth'i-a. See Timayenis, p. 44-45, vol. I.

P. 266.—"Vespasian," ves-pa'zhi-an; "Lollian," lol-li-a'nus.

"Aristomenes," ar'-is-tom'e-nes. The legendary hero of the Second Messenian War. In 865 B. C. he began hostilities and defeated Sparta several times but was at last taken prisoner. The legends tell that he was rescued from the pit where he had been confined, by an eagle and led home by a fox. When at last Ira fell, Aristomenes went to Rhodes, where he died.

"Aratus," a-ra'tus; "Achæan," a-chæ'an. See Timayenis, vol II., p. 242-243.

P. 267.—"Zeno." The founder of the Stoic philosophy. A native of Cyprus. He lived, probably, about 260 B. C. He is said to have spent twenty years in study, after which time he opened his school in a stoa of Athens. From this place his disciples received the name of *Stoics*.

Translation of foot-notes: "They call those sophists who for money offer knowledge to whomsoever wishes it." "A sophist is one who

seeks the money of rich young men." "Sophistry consists in appearing wise, not in being so; and the sophist becomes wealthy by an appearance of wisdom, not by being wise."

"Gorgias," gor'gi-as. "Leontine," le-on'tine. An inhabitant of Leontini in Sicily.

P. 268—"Dion," di'on chry-sos'to-mus, or Dion, the golden mouthed, so called from his eloquence.

"Strabo," stra'bo. His geography is contained in seventeen books. It gives descriptions of the physical features of the country, accounts of political events, and notices of the chief cities and men.

"Plutarch." His "Parallel Lives" is a history of forty-eight different Greeks and Romans. They are arranged in pairs, and each pair is followed by a comparison of the two men.

"Appianus," ap-pi-a'nus. The author of a history of Rome.

"Dion Cassius." (A. D. 155.) The grandson of Dion Chrysostomus.

"Herodianus," he'ro-di-a'nus.

"Epiktetus," ep'ic-te'tus. Few circumstances of his life are known. Only those of his works collected by Arrian are extant. As a teacher it is said that no one was able to resist his appeals to turn their minds to the good.

"Hierapolis," hi'e-rap'o-lis.

"Longinus," long-i'nus. The most distinguished adherent of the Platonic philosophy in the third century. His learning was so great that he was called "a living library." He taught many years at Athens, but at last left to go to Palmyra, as the teacher of Zenobia. When she was afterward defeated by the Romans and captured, Longinus was put to death (273).

"Lucian." See notes in THE CHAUTAUQUAN for May, 1883.

"Samosata," sa-mos'a-ta.

P. 270—"Thesmolopolis," thes-mop'o-lis. "Sappho," sap'pho. "Domitian," do-mish'i-an.

P. 271—"Pliny," plin'i. (61?-115?) The nephew of the elder Pliny. His life was largely spent in literary pursuits. His works extant are the *Panegyricus*, an eulogium on Trajan, and his letters.

"Seleukidæ," se-leu'ci-dæ. So named from Seleucus, the first ruler of the Syrian kingdom, one of the four into which Alexander's kingdom was divided on his death.

P. 272—"Archon Eponymus," ar'chon e-pon'y-mus. The first in rank of the nine Athenian Archons, so called because the year was named after him.

"Favorinus," fav'o-ri'nus. He is known as a friend of Plutarch and Herodes. Although he wrote much, none of his books have come down to us. "Herodes," he-ro'des.

"Mnesikles," mnes'i-cles. The architect of the Propylæa.

"Ilissus," i-lis'sus. A small river of Attica.

Translations of Greek inscriptions: "This is Athens the former city of Theseus." "Here stands the city of Adrian, not of Theseus."

P. 273—"Stymphalus," stym-pha'lus. A lake of Arcadia.

"Patræ," pa'træ.

P. 275—"Pliny." (23-75.) Although he held various civil and military positions, and during his whole life was the intimate friend and adviser of Vespasian, he applied himself so incessantly to study that he left one hundred and sixty volumes of notes. Pliny, the younger, says that the lives of those who have devoted themselves to study seem to have been passed in idleness and sleep when compared with the wonderful activity of his uncle. The only work of value come down to us is his "Historia Naturalis."

"Lebadeia," leb'a-dei'a.

"Stoa Poekile." The painted porch, so-called from the variety of curious pictures which it contained.

"Theseum," the-se'um. The temple erected in Athens in honor of the hero Theseus. To-day it is the best preserved monument of the splendor of the ancient city.

"Kerameikus," cer'a-mi'cus. A district of Athens, so called from Ceramus, the son of Bacchus, some say, but more probably from the potter's art invented there.

P. 277—"Commodus," com'mo-dus; "Caracalla," car'a-cal'la; "Dacia," da'ci-a; "Moesia," mœ'si-a; "Decius," de'ci-us.

P. 278—"Gallienus," gal'li-e'nus; "Valerianus," va-le'ri-a'nus.

"Pityus," pit'y-us; "Trapezus," tra-pe'zus; "Chrysopolis," chry-sop'o-lis; "Kyzikus," cyz'i-cus.

"Dexippus," dex-ip'pus. He held the highest official position at Athens. Was the author of histories, only fragments of which remain.

P. 279—"Artemis," ar'te-mis. This temple of Artemis, or Diana, Lübke calls the "famous wonder of the ancient world." Its dimensions were enormous, being 225 feet broad and 425 feet long. "Aurelian," au-re'li-an.

P. 280—"Flavius Josephus," fla'vi-us jo-se'phus. (37?-100?) The author of "History of the Jewish War" and "Jewish Antiquities."

"Philo Judeus," phi'lo ju-dæ'us. His chief works are an attempt to reconcile the Scriptures with Greek philosophy.

P. 281—"Nikolaus," nic'o-la'us; "Nikomedeia," nic'o-me-di'a; "Claudius Ptolemæus," clau'di-us ptol'e-mæ'us; "Pelusium," pe-lu'si-um; "Plotinus," plo-ti'nus; "Lykopolis," ly-cop'o-lis.

P. 282—"Zenobia," ze-no'bi-a; "Palmyra," pal-my'ra.

P. 286—"Maximian," max-im'i-an.

P. 287—"Constantius," con-stan'ti-us. "Chlorus," chlo'rus, "the pale;" "Naissus," nais'sus; "Galerius," ga-le'ri-us.

P. 288—"Eboracum," eb'o-ra'cum; "Licinius," li-cin'i-us; "Maxentius," max-en'ti-us.

P. 290—"Labarum," lăb'a-rūm. The word is supposed by many to have been derived from the Celtic word *lavar*, meaning command, sentence.

P. 292—"Zosimus," zos'i-mus; "Adrianopolis," a'dri-an-op'o-lis. "St. Jerome." (340-420.) The most famous of the Christian fathers. He spent many years in study and travel, was the friend of Gregory of Nazianzus and Pope Damascus. Much of his labor was given to obtain converts to his theories of monastic life. His commentaries on the Scriptures and translations into Latin of the New and Old Testaments are his most valuable works.

P. 294—"Athanasius," ath'a-na'si-us.

Translations of Greek in foot-note; "Speech against the Greeks." "Concerning the incarnation of Christ and his appearance to us."

P. 295—"Eusebius," eu-se'bi-us. He afterward signed the creed of the Council of Nice.

"Porphyrius," por-phy'r'i-us.

P. 297—"Tanais," tan'a-is. Now the Don. "Borysthenes," bo-rys'the-nes; the Dneiper.

P. 299—"Arianism," a'ri-an-ism.

P. 302—"Magnentius," mag-nen'ti-us.

P. 303—"Sapor," sa'por. "Nisibis," nis'i-bis.

P. 304—"Eusebia," eu-se'bi-a. "Eleusinian," el'u-sin'i-an. See foot-note p. 215, vol. II. Timayenis.

P. 305—"Aedesius," ae-de'si-us. "Chrysanthius," chry-san'thi-us

P. 306—"Ochlus," och'lus. The crowd, the populace.

"Thaumaturgy," thau'ma-tur'gy. The act of performing miracles, wonders.

P. 307—"Gregory Nazianzen," greg'o-ry na-zi-an'zen; "Basil." See page 312 for sketches of these men.

P. 308—"Hierophant," hi-er'o-phănt, a priest; "Oribasius," or-i-ba'si-us.

P. 311—"Dadastana," dad-as-ta'na.

P. 312—"Valentinian," va-len-tin'i-an.

P. 313—"Eleemosynary," el'ee-môs'y-na-ry. Relating to charity.

P. 315—"Gratian," gra'ti-an; "Theodosius," the'o-do'si-us; "Eugenius," eu-ge'ni-us.

P. 317—"Rufinus," ru-fi'nus; "Stilicho," stil'i-cho.

"Claudian," clau'di-an. The last of the classic poets of Rome. During the reigns of Honorius and Arcadius he held high positions in court, and from Stilicho he received many honors. Many of his poems are extant, all of them characterized by purity of expression and poetical genius.

P. 318—"Eutropius," eu-tro'pi-us; "Eudoxia," eu-dox'i-a; "Bauto," bau'to; "Gainas," gai'nas.

"Alaric," al'a-ric (all rich). Alaric made a second invasion into Italy in 410, taking and plundering Rome. His death occurred soon after.

P. 319—"Libanius," li-ba'ni-us. The emperors Julian, Valens and Theodosius showed much respect to Libanius, but his life was embittered

by the jealousies of the professors of Constantinople, and by continual dispute with the Sophists. His orations and a quantity of letters addressed to the eminent men of the times are still in existence.

P. 320.—“Nectarius,” nec-ta’ri-us.

P. 321.—“Theophilus,” the-oph’i-lus; “Chalkedon,” chal-ce’don.

P. 322.—“Cucusus,” cu’cu-sus; “Comana,” co-ma’na.

P. 323.—“Anthemius,” an-the’mi-us. “Pulcheria,” pul-che’ri-a.

P. 324.—“Kalligraphos,” cal-lig’ra-phos; “Athenais,” ath’e-na’is; “Leontius,” le-on’ti-us.

P. 326.—“Nestorius,” nes-to’ri-us; “Germanikeia,” ger-man’i-ci’a; “Marcian,” mar’ci-an; “Yezdegerd,” yez-de-jerd.

“Successor.” This successor was Varanes I. He waged wars with the Huns, Turks and Indians, performing deeds which ever since have made him a favorite hero in Persian verse.

P. 327.—“Attila,” at’ti-la; “Aetius,” a-e’ti-us.

P. 328.—“Aspar,” as’par; “Basiliscus,” bas-i-lis’cus; “Verina,” ve-ri’na.

P. 329.—“Odoacer,” o-do’a-cer; “Ariadne,” a-ri-ad’ne; “Isaurian,” i-sau’ri-an; “Anastasius,” an-as-ta’si-us.

P. 330.—“Sardica,” sar’di-ca.

“Prokopius,” pro-co’pi-us. (500–565.) An historian as well as rhetorician. His talents early attracted the attention of Belisarius, who made him his secretary. Afterward Justinian raised him to the position of prefect of Constantinople. Among his extant works are several volumes of histories and orations, besides a collection of anecdotes, mainly court gossip about Justinian, the empress Theodora, Belisarius, etc.

P. 331.—“Belisarius,” bel-i-sa’ri-us.

“Collection of Laws.” Justinian first ordered a collection of the various imperial *constitutiones* which he named “Justinianus Codex.” The second collection was of all that was important in the works of jurists, and was called the “Digest.” This work contained nine thousand extracts, and the compilers are said to have consulted over two thousand different books in their work. But for ordinary reference these volumes were of little value, so that the “Institutes” were written, similar in contents, but condensed. A new code was afterward promulgated; also several new *constitutiones*—together these books form the Roman law.

“Tribonian,” tri-bo’ni-an; “Side,” si’dé.

P. 333.—“Kalydonian Kapros.” The Kalydonian wild boar.

“Bronze-eagle.” In every race-course of the ancient Greeks a bronze eagle and a dolphin were used for signals in starting. The eagle was raised in the air and the dolphin lowered.

P. 334.—“Chosroes,” chos-ro-es. “The generous mind.” One of the most noteworthy of the kings of Persia. He carried on several wars with the Romans and extended his domain until he received homage from the most distant kings of Africa and Asia. Although despotic, his stern justice made him the pride of the Persians.

P. 335.—“Hæmus,” hæ-mus; “Aristus,” a-ris’tus; “Antes,” an’tes.

P. 336.—“Melanthias,” me-lan’thi-as.

P. 338.—“Fallmerayer,” fäl’meh-rt-er. (1791–1862.) A German historian and traveller. Among his important works are “Fragments from the East,” in which he publishes the results of his studies and travels there, and “The History of the Peninsula of Morea in the Middle Ages.” It is in this latter work that he advances the strange views here mentioned.

“Malelas,” mal’e-las. A Byzantine historian who lived soon after Justinian. He wrote a chronological history from the creation of the world to the reign of Justinian, inclusive.

P. 342.—“Heraclius,” her’a-cli’us; “Mauricius,” mau-ri’ci-us.

P. 345.—“Ayesha,” a’ye-sha. The favorite wife of Mohammed and daughter of Abubeker, who succeeded him. The twenty-fourth chapter of the Koran treats of the purity of Ayesha. After her husband’s death she in many ways supported the religion.

“Fatima,” fa’té-ma. The only child living at the time of the Prophet’s death. She became the ancestress of the powerful dynasty of the Fatimites.

P. 347.—“Aiznadin,” aiz’na-din; “Yermuk,” yer’muk; “Khaled,” kha’led.

P. 348.—“Herakleonas,” her-ac-le-o’nas; “Pogonatus,” pog-o-na’tus; “Moawiyah,” mo-ä-we’ya.

P. 349.—“Charles Martel.” (690–741.) The duke of Austrasia,

and the mayor of the palace of the Frankish kings. The name Martel, or “the hammer,” was given to him from his conduct in this battle.

P. 350.—“Kallinikus,” cal-li-ni’cus.

“Naphtha.” A volatile, bituminous liquid, very inflammable.

P. 352.—“Rhinothetus,” rhin-ot-me’tus.

P. 353.—“Chersonites,” cher-son’i-tes.

“Crim-Tartary.” The Crimea, also called Little Tartary.

“Absimarus,” ab-sim’a-rus; “Khazars,” kha’zars.

P. 354.—“Terbelis,” ter’be-lis.

P. 356.—“Bardanes,” bar-da’nes; “Philippicus,” phil-lip’pi-cus.

P. 357.—“Moslemas,” mos’le-mas.

P. 365.—“Haroun al-Rashid,” hä-roon’äl-rāsh’id. (765–809.) Aaron the Just, the fifth caliph of the dynasty of the Abassides. His conquests and administration were such that his reign is called the golden age of the Mohammedan nations. Poetry, science and art were cultivated by him. Haroun is the chief hero of Arabian tales.

“Nikephorus,” ni-ceph’o-rus.

P. 368.—“Theophilus,” the-oph’i-lus.

P. 369.—“Armorium,” ar-mo’ri-um.

P. 370.—“Bardas,” bar’das; “Theoktistus,” the-ok’tis-tus.

“John Grammatikus.” John the grammarian. It was he that held that there were three Gods and rejected the word unity from the doctrine of the being of God.

P. 371.—“Photius,” fo’shī-us. He played a distinguished part in the political, religious and literary affairs of the ninth century. After holding various offices, he was made patriarch by Bardas, deposing Ignatius. This incensed the Romish Church, and the controversy which arose did much to widen the gulf between the Eastern and Western Churches. Photius was deposed from his position, but replaced until the death of Basil, when he was driven into exile. Among his writings the most valuable is a review of ancient Greek literature. Many books are described in it of which we have no other knowledge.

P. 372.—“Arsacidæ,” ar-sac’i-dæ. So called from Arsaces, the founder of the Parthian empire. About 250 B. C. Arsaces induced the Parthians to revolt from the Syrian empire, of the Seleucidæ. The family existed four hundred and seventy-six years, being obliged in 226 A. D. to submit to Artaxerxes, the founder of the dynasty of the Sassanidæ.

P. 373.—“Porphyrogenitus,” por-phy-ro-gen’i-tus.

P. 374.—“Seljuks,” sel-jooks; “Commeni,” com-me’ni.

P. 375.—“Robert Guiscard,” ges’kar’. Robert, the prudent. (1015–1085.) The founder of the kingdom of Naples. He had come from Normandy to Italy, where by his wit and energy he had been appointed Count of Apulia in 1057. Soon after he added other provinces to his kingdom, conquered Sicily, and drove the Saracens from Southern Italy. His hasty departure from Thessaly was to relieve the Pope from the siege of Henry IV. After accomplishing this he immediately undertook the second expedition against Constantinople.

P. 376.—“Kephallenia,” cephal-le’ni-a; “Durazzo,” doo-rāt’so.

P. 377.—“Anna Commena.” The daughter of Alexis I. She wrote a full history of her father’s life; one of the most interesting and valuable books of Byzantine literature.

P. 379.—“Piacenza,” pe-ä-chen’za. The capital of the province of the same name in the north of Italy.

P. 382.—“Nureddin,” noor-ed-deen’. A Mohammedan ruler of Syria and Egypt.

P. 383.—“Dandolo,” dän’do-lo.

P. 385.—“Scutari,” skoo’tä-ree.

P. 386.—“Morisini,” mo-ri-si’ni.

P. 387.—“Boniface,” bôn’e-fäss; “Montferrat,” mönt-fer-rät’;

“Bouillon,” boo’yon’; “Laskaris,” las’ca-ris.

P. 388.—“Palæologus,” pa-læ-ol’o-gus.

BRIEF HISTORY OF GREECE.

The November readings in the “Brief History of Greece” are almost identical with the October readings in Timayenis’s history. For this reason no notes have been made out on the work. By consulting the notes on Timayenis’s history in THE CHAUTAUQUAN for October, all necessary help will be obtained. The papers on Physical Science and Political Economy, also the Sunday Readings, are too clear to need annotating.

NOTES ON REQUIRED READINGS IN "THE CHAUTAUQUAN."

GERMAN HISTORY.

P. 63, c. 1.—"Hermann." The Latinized form of whose name was Arminius. He had learned the language and the military discipline of the Romans when he led his tribe as auxiliaries to their legions.

"Varus," va'rus. He had been consul at Rome in B. C. 13, and afterward governor of Syria, where he accumulated great wealth. After this battle Varus put an end to his life.

P. 63, c. 2.—"Alemanni," al-e-man'ni.

"Sicambrians," si-cam'bri-ans. In early German history one of the most powerful tribes. They lived in Westphalia, between the Rhine and Weser.

"Chatti," or "Catti," so called from an old German word *cat* or *cad*, meaning "war." They dwelt south of the Sicambrians in the modern state of Hesse.

"Batavi." A Celtic people who had settled in the portion of the present Netherlands lying at the mouth of the Rhine. Their chief city was Leyden. The country was afterward extended and called Batavia.

P. 64, c. 1.—"Salzburg," sálts'boorg; "Ratisbonne," ra'tis-bon; "Augsburg," owgs'boorg; "Basle," bál, or "Basel," bá'zel; "Baden," bá'den; "Spire," spír'es; "Metz," mêts; "Treves," treevz.

"Ammianus," am'mi-a'nus mar'cel-li'nus. A Greek serving under the emperor Julian 363. Later we find him in Rome where he wrote a history from the time of Nerva, 96, to the death of Valens, 378. Many of the events were contemporaneous, so that the descriptions and incidents are particularly valuable.

P. 64, c. 2.—"Vandals." This tribe first appeared in the north of Germany, from whence they went to the Reisingebirge, sometimes called from them the Vandal Mountains. In the fifth century they worked their way from Pannonia into Spain, marched southward and founded the once powerful kingdom of Andalusia (Vandalusia). In 429 they conquered Africa. An hundred years afterward Belisarius overthrew their power, and the race disappeared. Many claim that descendants of the Vandals are to be seen among the Berber race, with blue eyes and light hair.

"Troyes," trwā.

"Catalaunian," cat'a-lau'ni-an. A people formerly living in northeastern France, their capital the present Châlons-sur-Marne.

"Méry-sur-Seine," mā-ré-sur-sane.

"Visigoths." In the fourth century the Goths were divided into the Ostrogoths and Visigoths or the Eastern and Western Goths; the latter worked their way from the Danube westward to France and Spain where they built up a splendid kingdom which lasted until 711, when it was overthrown by the Moors.

P. 65, c. 1.—"Genserik," jën'ser-ik. A king of the Vandals under whom the tribe invaded Africa in 429. They conquered the entire country, capturing Carthage in 439 and making it their capital. After the sack of Rome, the entire coast of the Mediterranean was pillaged. Genserik ruled until his death in 477.

"Heruli," her'u-li; "Sciri," si'ri; "Turcilingi," tur-cil-in'gi; "Rugii," ru'gi-i.

"Theodoric." The king of the Visigoths, who in 489 undertook to expel Odoacer from Italy. He defeated him in several battles and finally laid siege to Ravenna, where Odoacer had taken refuge. After holding out three years, Odoacer submitted on condition that he rule jointly with Theodoric, but the latter soon murdered his rival. For thirty-three years Theodoric ruled the country. He was a patron of art and learning and his sway was very prosperous. The porphyry vase in which his ashes were deposited is still shown at Ravenna.

"Thuringians," thu-rin'gi-ans. Dwellers in the central part of Germany between the Harz Mountains and the Thuringian forest.

"Dietrich," de-trich; "Hildebrand," hil'de-brand.

"Siegfried," seeg'freed. See notes on "Nibelungenlied" in this number.

P. 65, c. 2.—"Langobardi" or Lombards. A German tribe which migrated southward from the river Elbe. In 568 they conquered the plains of northern Italy and founded a kingdom which lasted two centuries.

GERMAN LITERATURE.

The article on German Literature is abridged from Sime's article on this subject in the "Encyclopædia Britannica."

P. 66, c. 1.—"Nibelungenlied." The song of the Nibelungen. The work includes the legends of Siegfried, of Günther, of Dietrich, and of Attila; and the motives which bind them into a whole are the love and revenge of Kriemhild, the sister of Günther and Siegfried's wife. She excites the envy of Brunhild, the Burgundian queen, whose friend Hagen discovers the vulnerable point in Siegfried's enchanted body, treacherously slays him, and buries in the Rhine the treasure he has long before conquered from the race of the Nibelungen. There is then a pause of thirteen years, after which Kriemhild, the better to effect her fatal purpose, marries Attila. Thirteen years having again passed away her thirst for vengeance is satiated by slaying the entire Burgundian court. The Germans justly regard this epic as one of the most precious gems of their literature.—*Sime*.

"Ulfilas," ul'fi-las. (310–381.) The family of Ulfilas were Christians supposed to have been carried away by the Goths. In 341 he became the bishop of these people and soon induced a number of them to leave their warlike life to settle a colony in Moesia. Here he cultivated the arts of peace, doing much to civilize the people. He introduced an alphabet of twenty-four letters and translated all of the Bible except the book of Kings. This work is the earliest known specimen of the Teutonic language.

"Wolfram von Eschenbach," fon esh'en-bāk. He lived at the close of the twelfth century. A nobleman by birth and a soldier in the civil wars. He joined the court of Hermann of Thuringia in the castle of Wartburg (where Luther escaped after the Diet of Worms) and was a contestant in the famous musical contest called "The war of the Wartburg." Leaving here he afterward sang at many other courts, dying in 1225.

"Parzival" or Parcival, par'ci-val.

"Holy Grail." The chalice said to have been used by Christ at the Last Supper and in which the wine was changed to blood. As the legend runs it fell into the hands of Joseph of Arimathea, by whom it was held for centuries, but finally, at his death, it passed to his descendants, with whom it remained until its possessor sinned; then the cup disappeared. The Knights of the Round-Table sought it, but until Sir Galahad no man was found so pure in heart and life that he could look upon it. Sir Galahad in some romances is called Sir Percival or *Parzival*. Eisenbach wrote another romance, "Titural," founded on the same legend.

"Gottfried," gott'freed; "Tristram and Iseult," tris'tram, is'eult; "Gudrun," gu'drun.

"Walther von der Vogelweide," wäl'ter fon der fō'gel-wi'deh. (1165?–1228?) Walter "from the bird meadow." He lived some time at Wartburg and was a friend of King Philip and of Frederick II. He died on a little estate the latter had given him.

"Sachsenspiegel." Codex of the Saxon law.

"Schwabenspiegel." Codex of the Swabian law.

"Berthold," bër'tolt. (1215–1272.) His love for the poor led him to zealous work in their behalf. Through many years he preached in the open air in Germany, Switzerland and Hungary.

"Eckhart," êk'hart. The father of German speculative thought, as Bach calls him, was a Dominican monk who attempted to reform his order but preached so exalted a philosophy that the Pope demanded a recantation. Eckhart never gave this but claimed that his views were entirely orthodox. His prose is among the purest specimens in the German language.

"Meistersänger." Master-singer.

P. 66, c. 2.—"Shrove-Tuesday," or confession Tuesday is the day before Lent. Although originally a day of preparation for the Lenten fast, it was soon changed to one of merry-making and feasting. As everything was devised to increase the gaiety of the occasion, these plays soon became a regular feature.

"Reineke Vos." Reynard the fox.

"Barkhusen," bark'hu-sen; "Rostock," ros'töck.

"Ulrich von Hutten," ul'rich fon hoot'en. (1488–1523.) His life

was spent in hot contests with the enemies of his reforms. As an advocate of the new learning, he went from city to city teaching and writing; "Epistolæ Obscurorum Virorum" was written in defense of this theory. He espoused the cause of the Reformation more because it favored religious and secular progress than from sympathy with its principles.

"Hans Sachs." (1494-1576.) "Honest Hans Sachs," as he was called, was a cobbler of Nuremberg, who had learned verse-making from a *meistersänger* of Munich. His verses included every style of poetry known, but the "Shrove-Tuesday plays" were the best, being full of strong characters and striking situations. The hymn mentioned, "Why art thou cast down, O, my soul?" is but one of several by him.

"Leibnitz," lip'nits. (1646-1716.) Educated at Leipsic, he says of himself, that before he was twelve, he "understood the Latin authors, had begun to lisp Greek and wrote verses with singular success." After taking his degree he went to Frankfort under the patronage of a wealthy gentleman; here he devoted himself to composing treatises on religion, philosophy, law, etc. All manner of projects interested him. He tried to bring about a union between the Catholic and Lutheran Churches, to introduce a common alphabet for all languages, to urge the king of France to conquer Egypt, and other plans, more or less Utopian. In the latter part of his life he received high honor from Hanover, Vienna, and Peter the Great. His correspondence was voluminous, and his works covered almost the whole field of human thought.

"Klopstock," klop'stok. (1724-1803.)

"Wieland," wee'land. (1733-1813.)

"Lessing," lès'ing. (1729-1781.)

"Oberon," ób'er-on. The Oberon of Shakspeare. The king of the fairies and the husband of Queen Titania.

"Agathon," ag'a-thon. A tragic poet of Athens, who died about 400 B. C.

"Pietist," pi'e-tist. The name was applied to a certain class of religious reformers in Germany, who sought to restore purity to the Church. P. 67, c. 1.—"Herder," hër'der. (1744-1803.)

"Kant." (1724-1804.)

"Kritik." Critique of pure reason.

"Fichte," fik'teh. (1797-1879.)

"Hardenburg." (1772-1801.)

"Wilhelm von Schlegel," shla'gel. (1767-1845.)

"Friedrich." (1772-1829.)

"Tieck," teek. (1773-1853.)

"Fouqué," foo'ka'. (1777-1843.)

"Schleiermacher," shli'er-mä-ker. (1768-1834.)

"Feuerbach," foi'er-bäk. (1804-1872.)

"Schopenhauer," sho'pen-how'er. (1788-1860.)

"Freytag," fri'täg; "Heyse," hi'zeh; "Spielhagen," speel'hä-gen; "Reuter," roi'ter.

READINGS IN ART.

The papers on Sculpture are compiled from Redford's "Ancient Sculpture" and Lübke's "History of Art."

P. 75, c. 1.—"Mycenæ," my-ce'næ.

"Cesnola," ches'no-la. Born in Turin in 1832. He served in the Crimean war, and afterward in the war of the Rebellion. Having been made an American citizen he was appointed consul to Cyprus, where he discovered the necropolis of Idalion, a city which ceased to exist two thousand years ago. He began excavations, opening some eight thousand tombs, but an edict from the sultan stopped the work. Cesnola had already, however, gathered a magnificent collection of antiquities, which, in 1872 was purchased for the Metropolitan Museum of New York.

"Harpies." The reliefs on this monument represent harpies, fabulous monsters in Greek mythology, carrying off children.

"Frieze," freez. The broad band resting upon the columns of a porch is called the entablature. It is divided into three portions; the central one is the frieze.

P. 75, c. 2.—"Ageladas," ag'e-la'das. Not *Argeladas*.

"Myron." A Boeotian, born about 480 B. C. His master-pieces were all in bronze. The "quoit-player" and the "cow" are most famous. Myron excelled in animals and figures in action.

"Canachus," can'a-chus. (B. C. 540-508.) He executed the colossal

statue of Apollo at Miletus, was skilled in casting bronze, in gold and silver, and in wood carving.

"Callon," cal'lon. (B. C. 516.)

"Onatus," o-na'tus. (B. C. 460.) "Hegias," he'gi-as; "Critius," cri'ti-us.

"Calamis," cal'a-mis. (B. C. 467-429.) He worked in marble, gold and ivory. His horses are said to have been unsurpassable, and his heroic female figures superior to those of his predecessors.

"Pythagoras." Lived about 470 in Magna Græcia. He executed life-like figures in bronze.

"Lemnians," lem'ni-ans.

"Paris." At a certain wedding feast to which all the gods had been invited except the goddess of Strife, she, angry at the slight, threw an apple into their midst with the inscription "to the fairest." Juno, Minerva and Venus claimed it, and Jupiter ordered that Paris, then a shepherd on Mount Ida, should decide the dispute. As Venus promised him the most beautiful of women for his wife, he gave her the apple.

P. 76, c. 1.—"Pellene," pel-le'ne. A city of Achaia.

"Rochette," ro'shèt'. (1790-1854.) A French archaeologist.

"Alcámenes," al-cam'e-nés. (B. C. 444-400.) His greatest work was a statue of Venus.

"Agoracritus," ag'o-rac'ri-tus. (B. C. 440-428.) His most famous work was also a Venus, which he changed into a statue of Nemesis and sold because the people of Athens preferred the statue of Alcámenes.

"Pæonius," pæ'o-ni-us.

"Pediment." The triangular facing or top over a portico, window, gate, etc.

"Metope," met'o-pe. In the Doric style of architecture, the frieze was divided at intervals by ornaments called triglyphs. The spaces between these ornaments were called metopes.

"Cella." The interior space of a temple.

"Phigalia," phi-ga'li-a.

"Niké-Apteros." The wingless goddess of victory. Wingless, to signify that the prayer of the Athenians was that victory might never leave their city.

"Scopas," sco'pas. (395-350.) An architect and statuary, as well as sculptor. He was the architect of the temple of Minerva at Tegea, and assisted in the bas-reliefs of the mausoleum at Halicarnassus. The famous group of Niobe and her children is supposed to have been the work of Scopas.

"Praxiteles," prax-it'e-les. Born at Athens B. C. 392. He worked in both marble and bronze. About fifty different works by him are mentioned. First in fame stands the Cnidian Venus, "one of the most famous art creations of antiquity." Apollo as the lizard-killer, his faun and a representation of Eros are probably best-known.

"Nereid," nè're-id. A sea nymph.

"Mænad," mæ'nad. A priestess or votary of Bacchus.

P. 76, c. 2.—"Toro Farnese" or Farnese Bull. Was discovered in the sixteenth century and is now in the Naples museum. It represents the sons of Antiope tying Dirce to a bull by which she is to be dragged to death. The work when discovered went to the Farnese palace in Rome, hence the name of Farnese bull.

"Laocoon," la-oc'o-on. One of the chief groups in the Vatican collection; discovered at Rome in 1506. Laocoon was a priest of Apollo, who having blasphemed the god was destroyed at the altar with his two sons by a serpent sent by the deity.

"Niobe," ni'o-be. The group of Niobe and her children was probably first an ornament of the pediment of a temple. The subject is the vengeance of Apollo and Artemis upon the Theban queen Niobe, who had boasted because of her fourteen children, that she was superior to Leda who had but two. As a punishment all her children were destroyed.

"Pyromachus," py-rom'a-chus.

"Æsculapius," æs-cu-la'pi-us. The god of the medical art.

"Apollo Belvedere," bel-va-da'ra, or bel've-deer'. This statue by many is considered the greatest existing work of ancient art. The subject is the god Apollo at the moment of his victory over the Python. It was discovered in 1503, and takes its name from its position in the belvedere of the Vatican, a gallery or open corridor of the Vatican which is called *belvedere*, (beautiful view) from the fine views it com-

mands. It is of heroic size, and is considered the very type of manly beauty.

P. 77, c. 1.—“Torus,” to’rus. A large moulding used in the base of columns.

“Mæcenas,” mæ-ce’nas. (B. C. 73?-8.) A Roman statesman. His fame rests on his patronage of literature. He was a patron of both Horace and Virgil.

“Tivoli,” tiv’o-le.

“Varro,” (B. C. 116-28.) “The most learned of the Romans and the most voluminous of Roman writers.” He composed no less than 490 books; but two of these have come down to us.

“Arcesilaus,” ar-ces’i-la’us.

“Genetrix,” A mother.

“Septimius Severus,” sep-tim’i-us se-ve’rus. (A. D. 146-211.) Roman Emperor.

AMERICAN LITERATURE.

P. 77, c. 2.—“Sydney Smith.” (1771-1845.) Educated at Oxford, he took orders and became a curate in 1794. Afterward he taught, and in 1802 assisted in establishing the *Edinburgh Review*, of which he was the first editor. Although he had charge, during his life, of various parishes, he was active in literary work; for twenty-five years he contributed to the *Edinburgh Review*; he published “Sketches of Moral Philosophy,” several volumes of sermons, papers on “American Debt,” and many miscellaneous articles, all characterized by humor and sound sense.

“Kaimes,” or Kames, kamz. (1696-1782.) A Scottish jurist, educated at Edinburgh, and for thirty years practiced law; was then made Lord Chief Justice. He wrote many works on law, metaphysics, criticism, etc.

“Davy.” (1778-1829.) The English chemist. His attention was first directed to chemistry by his medical studies, and he made such progress in original investigation that at twenty-three he was made lecturer

on chemistry in the Royal Society of London. In 1817 he became a member of the French Institute, and his reputation as a chemist was second to that of no one in Europe. He wrote much and among his discoveries were the bases potassium, sodium, and iodine as a simple substance. His most valuable invention was the miner’s safety lamp.

“Jeffrey.” (1773-1850.) Educated for the law, but was deeply interested in literature. After being admitted to the bar this division of interest for a long time hindered his success. He was one of the original founders of the *Edinburgh Review*, and became its editor with the fourth number. He soon made the magazine an organ of liberal thought on every theme. His most valuable contributions were his literary criticisms. His work at the bar improved with his literary ability, and in 1834 he was made a judge, a position he held until his death.

“Passy,” pās’sē’.

P. 78, c. 1.—“Bancroft,” bāng’kroft. (1800.) See American Literature.

“Rufus King.” (1755-1827.) American statesman.

“Everett.” (1794-1865.) American orator and statesman.

P. 78, c. 2.—“Hessian,” hēsh’an. The troops were from Hesse-Cassel. The king, Frederick II., between 1776 and 1784, received over £3,000,000 by hiring these soldiers to the English government to fight against the Americans.

“Lanspach,” lanz’pāk; “Kniphausen,” knip’how’zen.

P. 79, c. 1.—“Brougham,” broo’am. (1779-1868.) A British statesman and author. After leaving school he spent some time in traveling and writing before being admitted to the bar. In 1810 he entered Parliament, and his first resolution was to petition the king to abolish slavery. From this time he was allied with the reforms of the age: the emancipation of Roman Catholics, government reforms, etc. The education of working people and charity schemes received the aid of his pen and voice, and he was instrumental in founding several societies since very powerful. In 1834 the change of ministry ended his official life, but his interest and zeal in public works never ceased.

TRICKS OF THE CONJURORS.

By THOMAS FROST.

The dense ignorance which prevailed during the seventeenth century on the subject of conjuring, as the word is now understood, would be scarcely credible at the present day, if instances did not even now occur at intervals to show that there are still minds which the light of knowledge has not yet penetrated. Books did not reach the masses in those days, and hence the beginning of the eighteenth century found people as ready to drown a wizard as their ancestors had been.

A book which was published in 1716, by Richard Neve, whose name is the first which we meet with in the conjuring annals of the eighteenth century, bears traces of the lingering fear of diabolical agency which still infected the minds of the people. Having stated, in his preface, that his book contained directions for performing thirty-three legerdemain tricks, besides many arithmetical puzzles and many jests, Neve says: “I dare not say that I have here set down all that are or may be performed by legerdemain, but thou hast here the most material of them; and if thou rightly understandest these, there is not a trick that any juggler in the world can show thee, but thou shalt be able to conceive after what manner it is done, if he do it by sleight of hand, and not by unlawful and detestable means, as too many do at this day.”

The following are a few of the tricks which puzzled the people of those days: The tricks of the fakirs, or religious mendicants of India were remarkable. One of these fellows boasted that he would appear at Amadabant, a town about two hundred miles from Surat, within fifteen days after being bur-

ied, ten feet deep, at the latter place. The Governor of Surat resolved to test the fellow’s powers, and had a grave dug, in which the fakir placed himself, stipulating that a layer of reeds should be interposed between his body and the superincumbent earth, with a space of two feet between his body and the reeds. This was done, and the grave was then filled up, and a guard was placed at the spot to prevent trickery.

A large tree stood ten or twelve yards from the grave, and beneath its shade several fakirs were grouped around a large earthen jar, which was filled with water. The officer of the guard, suspecting that some trick was to be played, ordered the jar to be moved, and, this being done by the soldiers, after some opposition on the part of the fellows assembled round it, a shaft was discovered, with a subterranean gallery from its bottom to within two feet of the grave. The impostor was thereupon made to ascend, and a riot ensued, in which he and several other persons were slain.

This trick has been repeated several times in India, under different circumstances, one of the most remarkable instances being that related by an engineer officer named Boileau, who was employed about forty years ago in the trigonometrical survey of that country. I shall relate this story in the officer’s own words, premising that he did not witness either the interment or the exhumation of the performer, but was told that they took place in the presence of Esur Lal, one of the ministers of the Muharwul of Jaisulmer.

“The man is said, by long practice, to have acquired the art

of holding his breath by shutting the mouth, and stopping the interior opening of the nostrils with his tongue; he also abstains from solid food for some days previous to his interment, so that he may not be inconvenienced by the contents of his stomach, while put up in his narrow grave; and, moreover, he is sewn up in a bag of cloth, and the cell is lined with masonry, and floored with cloth, that the white ants and other insects may not easily be able to molest him. The place in which he was buried at Jaisulmer is a small building about twelve feet by eight, built of stone; and in the floor was a hole, about three feet long, two and a half feet wide, and the same depth, or perhaps a yard deep, in which he was placed in a sitting posture, sewed up in his shroud, with his feet turned inward toward the stomach, and his hands also pointed inward toward the chest. Two heavy slabs of stone, five or six feet long, several inches thick, and broad enough to cover the mouth of the grave, so that he could not escape, were then placed over him, and I believe a little earth was plastered over the whole, so as to make the surface of the grave smooth and compact. The door of the house was also built up, and people placed outside, that no tricks might be played, nor deception practised.

"At the expiration of a full month, the walling of the door was broken, and the buried man dug out of the grave; Trevelyan's moonshee only running there in time to see the ripping open of the bag in which the man had been inclosed. He was taken out in a perfectly senseless state, his eyes closed, his hands cramped and powerless, his stomach shrunk very much, and his teeth jammed so fast together that they were forced to open his mouth with an iron instrument to pour a little water down his throat. He gradually recovered his senses and the use of his limbs; and when we went to see him he was sitting up, supported by two men, and conversed with us in a low, gentle tone of voice, saying that 'we might bury him again for a twelvemonth, if we pleased.'"

A conjuror was exhibiting a mimic swan, which floated on real water, and followed his motions, when the bird suddenly became stationary. He approached it more closely, but the swan did not move.

"There is a person in the company," said he, "who understands the principle upon which this trick is performed, and who

is counteracting me. I appeal to the company whether this is fair, and I beg the gentleman will desist."

The trick was performed by magnetism, and the counteracting agency was a magnet in the pocket of Sir Francis Blake Delaval.

In 1785 the celebrated automatic chess player was first exhibited in London, having previously been shown in various cities of Germany and France. It had been invented about fifteen years before by a Hungarian noble, the Baron von Kempelen, who had until then, however, declined to permit its exhibition in public. Having witnessed some experiments in magnetism by a Frenchman, performed before the Court of Maria Theresa, Kempelen had observed to the empress that he thought himself able to construct a piece of mechanism the operations of which would be far more surprising than the experiments they had witnessed. The curiosity of the empress was excited, and she exacted a promise from Kempelen to make the attempt. The result was the automatic chess-player.

The figure was of the size of life, dressed as a Turk, and seated behind a square piece of cabinet work. It was fixed upon castors, so as to run over the floor, and satisfy beholders that there was no access to it from below. On the top, in the center, was a fixed chess-board, toward which the eyes of the figure were directed. Its right hand and arm were extended toward the board, and its left, somewhat raised, held a pipe.

The spectators, having examined the figure, the exhibitor wound up the machinery, placed the cushion under the arm of the figure, and challenged any gentleman present to play.

The Turk always chose the white men, and made the first move. The fingers opened as the hand was extended toward the board, and the piece was deftly picked up, and removed to the proper square. If a false move was made by its opponent, it tapped on the table impatiently, replaced the piece, and claimed the move for itself. If a human player hesitated long over a move, the Turk tapped sharply on the table.

The mind fails to comprehend any mechanism capable of performing with such accuracy movements which require knowledge and reflection. Beckman says indeed that a boy was concealed in the figure, and prompted by the best chess-player whose services the proprietor could obtain.

TALK ABOUT BOOKS.

Oliver Wendell Holmes is a philanthropist in the world of letters. Since his college days at Harvard, where he distinguished himself by his contributions to the *Collegian*, he has been giving to his wide circle of readers strong, clean, good thoughts, mixed with the happiest humor. His essays have been among the most enjoyable of his writings. His publishers have recognized this and collected a dozen of them into "Pages from an Old Volume of Life."* There are many subjects touched, but his "Phi Beta Kappa" oration of 1870, "Mechanism in Thought and Morals," is, perhaps, the best in the collection. The two essays, written during the war for *The Atlantic* readers, have a pathos so touching, it completely does away with the false idea that Holmes is only a humorist. The volume is a pleasant book for an hour's reading; indeed, it may well be classed along with what the author himself has aptly called "pillow-smoothing authors;" not a dull, heavy book, but one whose easily-flowing thoughts and continued good humor, quiet the mind and allow the reader to pass into dreamy forgetfulness.

"Things that have to be done, should be learned by doing them." Teachers know as well, perhaps, as any class of people how applicable this old truism is to their work. They only learn by doing; but too often they learn the routine, not the science. A little book just published

by A. Lovell & Co.,* is sent out in the interest of thoughtful teaching. There are some excellent development lessons, in which, simply by questions, and a few simple materials, are developed ideas of the senses, of forms, flat and solid, ideas of right and left, etc. A series of lessons on plants and insects have for their object "to bring the child into contact with nature, to teach him to observe, think, reason, and to express himself naturally." The book contains an excellent paper on the much-discussed "Quincy School Work." No new departure in the educational world has caused more talk. That there is something in it no one doubts that knows of the results of Superintendent Parker's system, but how to use it is not easily explained. This essay will help teachers to understand the method and show them how it may be used.

During this year Messrs. Harper & Brothers have added to the biographies of eminent Americans three very valuable works. Following Mr. Godwin's life of Bryant, is the "Memoirs of John A. Dix."† In so pretentious a work as the latter it is unfortunate that the compilation should have been made by his son. The unbiased, impersonal judgment that makes a biography trustworthy, is wanting. The fondness of the writer is continually evident to the reader. The book, however, is

* Development Lessons for Teachers, by Esmond V. DeGraff and Margaret K. Smith. New York: H. Lovell & Co., 1883.

† Memoirs of John A. Dix; compiled by his son, Morgan Dix. In two volumes. New York, Harper & Brothers, 1883.

* Pages from an Old Volume of Life; a collection of essays (1857-1881) by Oliver Wendell Holmes. Boston: Houghton, Mifflin & Co., 1883.

valuable from its fullness and exactness. It is really an epitome of the history of the most exciting times in our annals. General Dix's part in the stirring events before and after the rebellion, his work as secretary of the treasury, as military commander during the New York riots in '63, and his position upon various questions of national policy, are all explained minutely, and his correspondence is given in full. Although so voluminous, the work is never fatiguing. A feature which adds to the interest of the book is the selections from his translations, sketches, etc. General Dix added to his political and military ability a literary taste that led him to cultivate letters. His translations are particularly good. *Stabat Mater*, his son has seen fit to publish; it seems a pity that *Dies Ira* was not also given.

The third of these biographies is the "Life of James Buchanan."* The author himself says of this work, that "it was followed within a week by an amount of criticism such as I do not remember to have seen bestowed on any similar book in the same space of time." Mr. Curtis was assigned a task from which most men would have shrunk. Mr. Buchanan's administration as President of the United States was not popular. The belief that he favored the secession of the Southern States has been general. For his biographer to treat him as a conscientious actor in the struggle before the war has necessarily entailed criticism. Mr. Curtis says in his preface, "My estimate of his abilities and powers as a statesman has arisen with every investigation I have made and it is, in my judgment, not too much to say of him as a President of the United States, that he is entitled to stand very high in the catalogue—not a large one—of those who have had the moral courage to encounter misrepresentation and obloquy, rather than swerve from the line of duty which their convictions marked out for them." Mr. Curtis will not change the popular opinion on the Buchanan administration, but he must modify that opinion. This treatment alone makes the work worth reading by both friend and foe. The most entertaining part of the book is the voluminous private correspondence, which well portray Mr. Buchanan's social and friendly nature.

One of the most delightful books of the season is "Spanish Vistas,"† by Mr. Lathrop. The publishers have given us a genuine *édition de luxe*, heavy paper, numberless choice illustrations, and beautiful binding. The book is the joint product of two artists, and if one wields the quill instead of the pencil he is no less artistic. Two things are particularly noticeable in Mr. Lathrop's fine descriptions of scenery, of architecture, city sights and peasant gatherings: the skill with which he chooses his point and time of observation, and his really superior coloring. He knows at what hour the Alhambra will exercise its supreme spell, where the picturesque vagabondism of these handsome Spanish rascals will be most striking. To this power add his ability in colors and there is not a page but glows with effective pictures. Character sketches enliven the volume. The commonplace American abroad is introduced in Whetstone, a man of "iron persistence and intense prejudice," who continually exclaims "I don't see what I came to Spain for. If there ever was a God-forsaken country," and who amid the grandeur of the cathedral of Seville squints along the cornice to see if it is straight. The writer has been ably assisted by his "Velveteen," alias Mr. C. S. Reinhart, whose pictures give doubled value to the book. To all contemplating a trip to Spain the chapter on "Hints to Travelers" will be valuable.

"Spanish Vistas" represents one class of books on travels. There is another more interesting to the majority of people, in which facts and adventures are the chief elements. Such a work is "The Golden Chersonese,"‡ by Isabella Bird. After having traveled on horseback through the interior of Japan, and braved the roughest passes of the Rocky Mountains, and spent six months among the wonders of the Sandwich Islands, this indefatigable woman penetrates that *terra incognita*, the Malay Peninsula. The dangers and inconveniences which she undergoes to get there and get through are remarkable. She sailed from Hong Kong not long after a party of piratical Chinese, shipping as steerage passengers on board a river steamer, had massacred the officers and captured the boat. There was but one English passenger on board besides herself, and some two thousand Chinese imprisoned in the steerage, an iron grating over each

exit, and an officer ready to shoot the first man who attempted to force it. The decorations of the saloons consisted of stands of loaded rifles and unsheathed bayonets. She penetrates the country where the mosquitoes are a terror to life; snakes, land-leeches and centipedes are everywhere, but the enthusiastic traveler mentions them but casually. The dangers and bravery of the writer of course add piquancy to the interesting description of the scenes, the customs and peculiarities of "The Golden Chersonese."

Along with these fresh works comes out a new edition of one of the pioneers in this field of literature. We refer to Dr. Hayes' "Arctic Boat Journey."* In 1860 it was first published, and speedily took its place as an authority on Arctic travels. The fresh interest given to this subject by the sad fate of the "Jeannette" has led to a new edition. The account loses nothing of interest by time, but rather become clearer from the added knowledge we have of the frozen seas and icy lands.

No work will be found a more valuable addition to a C. L. S. C. library than Lübke's "History of Art."† In connection with the art readings it will be found invaluable. Since its first publication in 1860 it has gone through seven editions, and that, too, in critical Germany. The new translation from the latest German edition is the best.

BOOKS RECEIVED.

"Bible Stories for Young Children," by Caroline Hoadley. Philadelphia: J. B. Lippincott & Co.

"Ancient Egypt in the Light of Modern Discoveries," by Professor H. S. Osborn, LL.D. Cincinnati: Robert Clark & Co., 1883.

"Woman and Temperance; or, The Work and the Workers of The Woman's Christian Temperance Union," by Frances E. Willard, President of the W. C. T. U. Hartford, Conn.: Park Publishing Co., 1883.

"The Soul Winner." A Sketch of Facts and Incidents in the Life and Labors of Edmund J. Zard, for sixty-three years a class-leader and hospital visitor in Philadelphia. By his sister, Mrs. Mary D. James. New York: Phillip & Hunt; Cincinnati: Walden & Stowe, 1883.

"The Preacher and His Sermon." A Treatise on Homiletics. By Rev. John W. Etter, B.D. Dayton, O.: United Brethren Publishing House, 1883.

"Seven Stories, with Basement and Attic." By the author of "Reveries of a Bachelor." New York: Charles Scribner's Sons, 1884.

"Reveries of a Bachelor; or, A Book of the Heart," by Ik Marvel. New and revised edition. New York: Charles Scribner's Sons, 1884.

"The Story of Roland," by James Baldwin. New York: Charles Scribner's Sons, 1883.

"Our Young Folks' Plutarch;" edited by Rosalie Kaufman. Philadelphia: J. B. Lippincott & Co., 1883.

"Young Folks' Whys and Wherefores." A Story by Uncle Lawrence. Philadelphia: J. B. Lippincott & Co., 1884.

"Mrs. Gilpin's Frugalities." Remnants, and Two Hundred Ways of using them. By Susan Anna Brown, author of "The Book of Forty Puddings." New York: Charles Scribner's Sons, 1883.

*An Arctic Boat Journey in the Autumn of 1854, by Isaac I. Hayes, M. D. New edition, enlarged and illustrated. Boston: Houghton, Mifflin & Company, 1883.

†Outlines of the History of Art, by Dr. Wilhelm Lübke. A new translation from the seventh German edition, edited by Clarence Cook. New York: Dodd, Mead & Co., 1881.

This powder never varies. A marvel of purity, strength and wholesomeness. More economical than the ordinary kinds, and can not be sold in competition with the multitude of low test, short weight, alum or phosphate powders. Sold only in cans. ROYAL BAKING POWDER CO., 106 Wall Street, New York.

*Life of James Buchanan, Fifteenth President of the United States. By George Ticknor Curtis. In two volumes. New York: Harper & Brothers, 1883.

†Spanish Vistas, by George Parsons Lathrop, illustrated by Charles S. Reinhart. New York: Harper & Brothers, 1883.

‡The Golden Chersonese, by Isabella Bird. New York: G. P. Putnam's Sons, 1883.

THE CHAUTAUQUAN.

1883-1884.

The Fourth Volume Begins with October, 1883.

A monthly magazine, 76 pages, ten numbers in the volume, beginning with October and closing with July.

THE CHAUTAUQUAN

is the official organ of the C. L. S. C., adopted by the Rev. J. H. Vincent, D.D., Lewis Miller, Esq., Lyman Abbott, D.D., Bishop H. W. Warren, D.D., Prof. W. C. Wilkinson, D.D., and Rev. J. M. Gibson, D.D., Counselors of the C. L. S. C.

One-half of the "Required Readings" in the C. L. S. C. course of study for 1883-84 will be published only in THE CHAUTAUQUAN.

Our columns will contain articles on Roman, German, French and American History, together with "Sunday Readings," articles on Political Economy, Civil Law, Physical Science, Sculpture and Sculptors, Painting and Painters, Architecture and Architects.

Dr. J. H. Vincent will continue his department of C. L. S. C. Work.

We shall publish "*Questions and Answers*" on every book in the course of study for the year. The work of each week and month will be divided for the convenience of our readers. Stenographic reports of the "Round-Tables" held in the Hall of Philosophy during August will be given.

Special features of this volume will be the "C. L. S. C. Testimony" and "Local Circles."

THE EDITOR'S OUTLOOK, EDITOR'S NOTE-BOOK AND EDITOR'S TABLE, WILL BE IMPROVED.

The new department of *Notes on the Required Readings* will be continued. The notes have met with universal favor, and will be improved the coming year.

Miscellaneous articles on Travel, Science, Philosophy, Literature, Religion, Art, etc., will be prepared to meet the needs of our readers.

Prof. Wallace Bruce will furnish a series of ten articles, especially for this Magazine, on Sir Walter Scott's "Waverley Novels," in which he will give our readers a comprehensive view of the writings of this prince of novelists.

Rev. Dr. J. H. Vincent, Rev. Dr. G. M. Steele, Prof. W. C. Wilkinson, D.D., Prof. W. G. Williams, A.M., Bishop H. W. Warren, A. M. Martin, Esq., Rev. C. E. Hall, A.M., Rev. E. D. McCreary, A.M., and others, will contribute to the current volume.

The character of THE CHAUTAUQUAN in the past is our best promise of what we shall do for our readers in the future.

THE CHAUTAUQUAN, one year, - - - \$1.50

CLUB RATES FOR THE CHAUTAUQUAN.

Five subscriptions at one time, each, - - - \$1.35
Or, for the five - - - 6.75

In clubs, the Magazine must go to one postoffice.

Remittances should be made by postoffice money order on Meadville, or draft on New York, Philadelphia or Pittsburgh, to avoid loss. Address,

DR. THEODORE L. FLOOD,

Editor and Proprietor,

MEADVILLE, PA.

Complete sets of the *Chautauqua Assembly Herald* for 1883 furnished at \$1.00.

CHARLES SCRIBNER'S SONS' NEW BOOKS.

Biblical Study. Its Principles, Methods, and a History of its Branches. Together with a Catalogue of a Reference Library of Biblical Study. By CHARLES A. BRIGGS, D.D., Professor of Hebrew and Cognate Languages in Union Theological Seminary. 1 vol. 12mo, \$2.50.

Professor Briggs' book is admirably adapted for the use of the great number of readers and Bible students who desire to know the results of the most recent investigation and the best modern scholarship in the field of Biblical Study. Without such a guide it is impossible to comprehend the discussions which now agitate the religious world as to the canon, the languages, the style, the text, the interpretation, and the criticism of Scripture. Each of these departments, with other kindred topics, is treated in a brief but thorough and comprehensive manner, and their history and literature are presented together with their present aspect.

The Scriptural Idea of Man. By MARK HOPKINS, D.D., LL.D., 1 vol., 12mo, \$1.00.

"We wish every theological student in the land might have the chance, at least, of reading this book. The doctrines of the Bible in relation to man in his original nature have seldom been more powerfully enforced, and the different schools of modern infidelity have seldom been exposed more completely in all their weakness. It is like taking a tonic or a breath of mountain air for one to listen to such teachings as the pen of Doctor Hopkins here gives to the younger race of ministers."—*The Christian Intelligencer*.

The Grounds of Theistic and Christian Belief. By GEORGE P. FISHER, D.D., LL.D., Professor of Ecclesiastical History in Yale College. 1 vol., crown 8vo, \$2.50.

This volume embraces a discussion of the evidences of both natural and revealed religion, and prominence is given to topics having special interest at present from their connection with modern theories and difficulties. Professor Fisher's learning, skill in argument, and power of language have given him the position of one of the foremost defenders of the faith now living, and this volume will be useful to many in clearing up perplexities and throwing new light upon the nature of the Christian faith and its relation to modern thought.

Christian Charity in the Ancient Church. By DR. GERHARD UHLHORN, author of "The Conflict of Christianity with Heathenism." 1 vol. crown 8vo, \$2.50.

Dr. Uhlhorn is favorably known on this side of the Atlantic by his able and fascinating treatment of one of the most important chapters in history, "The Conflict of Christianity with Heathenism."

The Life of Luther. By JULIUS KOSTLIN, Professor in the University of Halle. With more than 60 illustrations from original portraits, documents, etc. 1 vol. 8vo.

"At last we have a life of Luther which deserves the name. . . . The Herr Kostlin, in a single well-composed volume, has produced a picture which leaves little to be desired. A student who has read these six hundred pages attentively will have no question left to ask."—JAMES ANTHONY FROUDE in *The Contemporary Review*.

The Middle Kingdom. A survey of the Geography, Government, Literature, Social Life, Arts, and History of the Chinese Empire and its inhabitants. With illustrations and a new map of the Empire. By S. WELLS WILLIAMS, D.D., LL.D. 2 vols. royal 8vo, \$9.00.

This new issue of Dr. S. Wells Williams's standard and important work, "The Middle Kingdom," is practically a new book. The text of the old edition has been largely rewritten, and the work has been expanded so as to include a vast amount of new material collected by Dr. Williams during the later years of his residence in China, as well as the most recent information regarding all the departments of the Empire.

The Story of Roland. By JAMES BALDWIN. With a series of illustrations by R. B. Birch. 1 vol. square 12mo, \$2.00.

This volume is intended as a companion to "The Story of Siegfried." As "Siegfried" was an adaption of Northern myths and romances to the wants and understanding of young readers, so is this story a similar adaption of the Middle Age romances relating to Charlemagne and his paladins.

The Hoosier School-Boy. By EDWARD EGLESTON, author of "The Hoosier School-Master," etc. With full-page illustrations. 1 vol. 12mo, \$1.00.

"Those who have read 'The Hoosier School-master'—and who has not?—will feel that they must have this companion volume. Mr. Eggleston is a writer of very charming stories of a peculiar character. His stories always mean something, and are pervaded by a Christian tone of thought and feeling."—*Christian Secretary, Hartford*.

Mrs. Gilpin's Frugalities. Remnants, and 200 Ways of Using Them. By SUSAN ANNA BROWN, author of "The Book of Forty Puddings." 1 vol. illuminated, \$1.

This little volume, which in the range of cook-book literature occupies a new and unoccupied field, aims to combat the spirit of wastefulness that is the besetting sin of American housekeeping. Miss Brown provides a multitude of receipts for transforming these remnants into savory and nutritious *plats*, side dishes, entrees, etc. Some of these receipts are from the French, but most of them are from the author's own experiments.

These books are for sale by all book-sellers, or will be sent, post-paid, on receipt of price.

CHARLES SCRIBNER'S SONS, Publishers,
743 and 745 Broadway, New York.

THE CHAUTAUQUAN.

DECEMBER.

GERMAN HISTORY.

By REV. W. G. WILLIAMS, A. M.

III.

THE FRANKS AND MEROVINGIANS.

After the fall of the Western Empire the Franks step into the foreground and show themselves of all the German tribes the most capable of founding a stable government. From the first they were distinguished from the others by their superior military discipline, and by their pride and ambition. They had always been looked upon as formidable warriors. Few of them wore helmets and mail; their breasts and backs were covered only by the shield. From the hips downward they wrapped themselves in close-fitting linen or leather, so as to display each man's tall, upright form. Their principal weapon was the two-edged battle-axe, which served for throwing as well as striking. They also carried frightful javelins with barbed points. Their own laws describe them as brave warriors, profound in their plans, manly and healthy in body, handsome, bold, impetuous, and hardy. But their enemies, perhaps with some justice, denounced them as the most faithless and cruel of men. The distinguishing ornament of the kings was their hair, which was left uncut, flowing freely over the shoulder. The people were still heathen, untamed and uncivilized, yet in constant intercourse with the Romans in Gaul.*

CLOVIS, THE FIRST FRANKISH KING.

The name of Clovis is not alone to be remembered as that of the founder of the kingdom of the Franks, but for the remarkable so-called conversion which he experienced during a hard-fought battle with the Alemanni. While the result was yet in doubt, Clovis, in the face of his army, called upon the new God, Christ, and vowed to serve him, if he would help him now. He was victorious; received instruction from St. Remigius, and was then baptized, with three thousand of his noblest Franks, in the cathedral at Rheims. "Bow thy head in silence, Sigambrian," said the saint; "worship what thou hast hitherto destroyed; war against what thou hast worshiped." This was by no means the only instance of wholesale conversions to

Christianity in consequence of a victory. The heathen, when defeated by Christians, commonly ascribed the result to the superior strength of the Christian God, and often resolved to seek his protection for themselves. It was the Catholic, not the Arian faith, which Clovis adopted. He was straightway recognized by the Pope as "the most Christian king," the appointed protector and propagator of the true faith against Arian Germany.

Clovis built up his kingdom with many a deed of blood, but with great vigor. His empire comprised German as well as Roman territory; but struck root firmly in the old native soil, from which it drew ever new strength: and therefore it was that its duration was not merely momentary, like that of the Gothic kingdoms, but it proved the beginning of the monarchy of the Middle Ages, the beginning of a new national life, in which Roman form was animated with fresh German strength. Clovis ruled his wide realm from Paris, a city which had existed even before the days of Cæsar and the Romans in Gaul. He died in Paris at the early age of forty-five.*

From Clovis to *Karl der Grosse* (French, *Charlemagne*; Latin, *Carolus Magnus*), a period of two hundred and fifty years, we witness not only the vicissitudes incident to the establishment of a new social and political order upon the ruins of the old, with all the ferocity of manner and barbarity of action to be expected in such an age; but also there is the gradual displacement of the old pagan religions by the newer one called Christianity. It is a period of strifes, of jealousies and blood. It was toward the last of this period that occurred the memorable battle of Poitiers, between the Franks under Karl, afterward surnamed *Martel*, and the Saracens, who having crossed from Africa and possessed themselves of entire Spain, next collected a large army, and under command of Abderahman, Viceroy of the Caliph of Damascus, set out for the conquest of France and Germany, as yet an undivided nationality. Thus the new Christian faith of Europe, still engaged in quelling the last strength of the ancient paganism, was suddenly called upon to meet the newer faith of Mohammed, which had determined to subdue the world.

Not only France, but the Eastern Empire, Italy and England looked to Karl, in this emergency. The Saracens crossed the Pyrenees with 350,000 warriors, accompanied by their wives and children, as if they were sure of victory and meant to possess the land. Karl called the military strength of the whole broad kingdom into the field, collected an army nearly equal in numbers, and finally, in October, 732, the two hosts stood face to face, near the city of Poitiers. It was a struggle almost as grand, and as fraught with important consequences to the world, as that of Aëtius and Attila, nearly 300 years before. Six days were spent in preparations, and on the seventh the battle began. The Saracens attacked with that daring and impetuosity which had gained them so many victories; but, as the old chronicle says, "the Franks, with their strong hearts and powerful bodies, stood like a wall, and hewed down the Arabs with iron hands." When night fell, 200,000 dead and wounded lay upon the field. Karl made preparations for resuming the

*Lewis.

*Lewis.

battle on the following morning, but he found no enemy. The Saracens had retired during the night, leaving their camps and stores behind them, and their leader, Abderrahman, among the slain. This was the first great check the cause of Islam received, after a series of victories more wonderful than those of Rome. From that day the people bestowed upon Karl the surname of *Martel*, the Hammer, and as Charles Martel he is best known in history.*

CHARACTER OF THE GERMAN CHRISTIANITY AT THIS TIME.

The Christianity of the Germans, and even that of the Roman provinces, for many generations after the date of their "conversion," was a very different kind of religion from that which is now held by enlightened Christians. Constantine and several of his successors were actually worshipped after death by multitudes of the Christians of those days. The apostolic doctrines were not conceived as a system of belief by the people, nor even by their teachers; the personal sovereignty of Christ as a king and warrior, and the future heaven or hell to be awarded by him, were apprehended as practical truths, but were overlaid with a dense mass of superstitious notions and observances, many of them legacies from heathenism. Above all, the Germans indulged without stint their passion for the wonderful; and the power of Christianity over them depended largely on the supply of miracles and of potent relics which it could furnish them. The workers of miraculous cures were numerous; they were esteemed as the favorites of heaven, and cities and princes contended with one another for their bones. Some of the popes were wise enough to discourage the zeal for miracles; and as late as A. D. 590, Pope Gregory I. wrote to St. Augustine, of England, cautioning him against spiritual pride as a worker of them. But it was not long before the papacy became the great center from which relics of the saints were distributed throughout the Church. The Roman catacombs were ransacked, and bones of saints found in an abundance sufficient to supply Christendom for ages. The Pope's guaranty of genuineness was final; and this resource contributed immeasurably to increase the wealth and power of the Holy See. The legends of the saints, as circulated and preserved, mainly by tradition, were for centuries the intellectual food of the Church at large; and were filled with idle and monotonous tales of wonderful cures in mind and body, wrought by the holy men and women in their lives, or by their corpses or their tombs. No doubt was entertained, even by the most intelligent, of the truth of these miracles. The modern conception of nature, as the work of a divine will which is unchangeable, and which therefore expresses itself in fixed, uniform laws, was then unknown. The spiritual conception of Christianity, as life by a personal trust in a pure, holy, and loving God, was set forth, indeed, by a few writers and preachers, and was doubtless verified in the experience of many a humble heart; but it was far above the thoughts of the people, or even of the clergy at large. To them no religion was of any value which was not magical in its methods and powers, and a charm to secure good fortune or to avert danger. In short, the Church was one thing, Christianity another; and the priestly ambition of the great organization to rule over men's lives and estates entirely eclipsed and obscured the spiritual work of the kingdom which is not of this world. Nothing in the early German character is more attractive than the habitual and general chastity of the people, and their reverence for the marriage tie. But the great migrations corrupted them; and the degradation of marriage in the succeeding centuries was promoted and completed by the influence of the Church. Hardly any agency can be traced in history which has wrought greater social and moral evil than the contempt for human love and for the marriage tie, which was sedulously cultivated by the Roman Church from the beginning of the fourth century. Yet, there are indications enough to satisfy us that the doctrines of the New Testament

had not lost their power; and that truth, purity, divine charity, and Christian heroism were yet kept alive in many hearts. Thousands of men and women, whose minds and lives were darkened by the teachings and practices of asceticism, monasticism and gross superstitions, still cherished a devout, self-sacrificing love for their unseen Master and Lord and stood ready to die for him. Even the idea of Christian brotherhood was not entirely lost; and the common worship of the same Redeemer by master and slave did much to mitigate the horrors that grew out of their relation.*

CHARLES THE GREAT.

The history of Germany may now for half a century be ranged about the central figure, Charles the Great, more commonly called Charlemagne. Indeed, so conspicuous a figure is he that it is impossible for all subsequent history to lose sight of him. The decayed Merovingian scepter when it fell into his hands was swayed with such unprecedented vigor and ability that its old name soon disappeared, and henceforth it is the Carolingian, and Charles becomes the head and founder of a new dynasty. The first years of his rule are marked by continuous wars of conquest. The brave and savage Saxons resisted him and the Christianity which he championed until compelled by his all-conquering arms to yield. Saxony emerged from his hands subdued and Christian, divided into eight bishoprics, studded with new cities and abbeys which proved centers of civilization; and that wild country, until then barbarous and pagan, entered into communion with the rest of the empire.

He next turned his attention to Italy, where his career of victory was uninterrupted. He visited Rome, and, dismounting at a thousand paces from the walls, walked in procession to the church of St. Peter on the Vatican Hill, kissing the steps as he ascended in honor of the saints by whom they had been trodden. In the vestibule of the church he was received by the Pope, who embraced him with great affection, the choir chanting the psalm, "Blessed is he who cometh in the name of the Lord." Then they descended into the vaults, and offered up their prayers together at the shrine of St. Peter.†

EXTENT OF HIS EMPIRE—HIS CORONATION.

In the course of a reign of forty-five years, Charlemagne extended the limits of his empire beyond the Danube; subdued Dacia, Dalmatia, and Istria, conquered and subjected all the barbarous tribes to the banks of the Vistula, and successfully encountered the arms of the Saracens, the Huns, the Bulgarians, and the Saxons. His war with the Saxons was of more than thirty years duration, and their final conquest was not achieved without an inhuman waste of blood, through what has been considered a mistaken zeal for the propagation of Christianity, by measures which that religion can not be said to sanction or approve. All these wars were very nearly finished in the year 800. Charlemagne then found himself master of France, of Germany, of three-quarters of Italy, and a part of Spain. He had increased by more than a third the extent of territory which his father had left him. These vast possessions were no longer a kingdom, but an empire. He thought he had done enough to be authorized to seat himself on the throne of the West; and, as his father had required at the hands of the Pope his regal crown, so it was from the Pope that he demanded his imperial diadem. He was, therefore, with great ceremony, created Emperor of the West in St. Peter's, at Rome, by Pope Leo III., on Christmas day 800. It was a great event, for that imperial title which had remained buried under the ruins wrought by the barbarians, was drawn thence by the Roman pontiff, and shown to scattered nations and enemies as a rallying sign.

The crown which he received was destined to be for one thousand and six years the symbol of German unity, whilst the assembled people shouted, "Long life and victory to Caro-

*Taylor.

*Lewis.

† Menzies.

lus Augustus, the great and peace-bringing Roman Emperor, whom God hath crowned!" Thus, 324 years after the imperial dignity had disappeared, it was renewed by Charles. In this coronation act Pope Leo III. had fulfilled a function like St. Remy did in consecrating Clovis. His successors constituted it a privilege, and the pontiffs considered themselves the dispensers of crowns. During the whole of the middle ages the imperial consecration could only be given at Rome, and from the hands of the Holy Father. More than one war arose out of this prerogative.*

THE CHARACTER AND ACHIEVEMENTS OF CHARLEMAGNE—HIS PLACE IN HISTORY.

Charlemagne, or Charles the Great, is the name which history has agreed to give to the founder of the German empire—incorporating the epithet with the name itself. We have recited in outline the facts of his wonderful career, as they are recorded in the meagre records of contemporary historians, and must rely upon the same authentic testimony in attempting to estimate his mind, character, and work. But the Charles of history is one; the Charles of heroic legend and popular fame is another. The former is a powerful conqueror and politic statesman, whom some eminent writers regard as the greatest of all monarchs; the latter is a Christian saint, superhuman in strength, beauty, and wisdom, incapable of defeat in war, of error in judgment, or of infirmity or corruption in his own will. Thus the song of Roland says: "His eyes shone like the morning star; his glance was dazzling as the noonday sun. Terrible to his foes, kind to the poor, victorious in war, merciful to offenders, devoted to God, he was an upright judge, who knew all the laws, and taught them to his people as he learned them from the angels. In short, he bore the sword as God's own servant." As Theodoric had been the center of the ancient popular minstrelsy, so Charles the Great became the central figure in that more cultivated heroic poetry, chiefly the work of the clergy, in which were celebrated the deeds of the twelve paladins, with Roland and the fight of Roncesvalles:

"When Charlemain with all his peerage fell
By Fontarabia."

When we consider the profound impression made on the popular mind by this person, as represented in legend and song, we are almost ready to inquire whether its influence upon later German history was not greater than that of his authentic achievements. But it is true that the entire German race owes to him its first political organization. It was the purpose of his life, which never wavered, to unite all the German tribes under the control of one imperial government and of one Christian Church. In the greater part of this work he succeeded, and thus left the stamp of his mind upon the following centuries, through all the Middle Ages. The national consciousness of the collective German tribes dates from his reign, and it is at the beginning of the ninth century that "the Germans" are first spoken of in contrast with the Roman peoples of the empire, although the national name did not come into general use until four generations later, in the reign of Otto the Great. When Charles mounted the throne, he was twenty-four years of age, in the strength and prime of his youth. His person was huge and strong, combining the presence and muscular power of the heroes of song; so that he found it sport to fight with the gigantic wild bulls in the forest of Ardennes. His passion for labor, war, and danger was that of the adventurous warriors of the great migration. In the momentous affairs of state, he exhibited the want of feeling and the unscrupulousness which have been common to nearly all great warriors; but in daily intercourse with those around him, he had the mildness, cheerfulness, and freshness of spirit which add so much grace to true greatness. These characteristics were those of his people; but that which specially distinguished him was the far-see-

ing mind, which had caught from ancient Rome the conception of a universal state, and was wise enough, without slavish copying, to adapt this conception to the peculiar requirements of the widely different race he ruled. This lofty intellect appears the more wonderful, that no one can tell how he obtained his mental growth, or who were his instructors; he seems to shine out of the darkness of his age like a sun.

Charlemagne's active mind gave attention to all matters, great and small. His untiring diligence, and his surprising swiftness in apprehension and decision, enabled him to dispatch an amount of business perhaps never undertaken by another monarch, unless by Frederick II., of Prussia, or by Napoleon Bonaparte. He was simple in his own attire, usually wearing a linen coat, woven at home by the women of his own family, and over it the large, warm Frisian mantle; and he demanded simplicity in his followers, and scoffed at his courtiers when their gorgeous silks and tinsel, brought from the East, were torn to rags in the rough work of the chase. Hunting in his favorite forest of Ardennes was the chief delight and recreation of his court. Next to this, he enjoyed swimming in the warm baths at Aix, which became his favorite residence. At his meals he listened to reading; and even condescended to join the monks, detailed for the purpose, in reading exercises. He founded schools in all the convents, and visited them in person, encouraging the diligent pupils, and reproving the negligent. He also introduced Roman teachers of music, to improve the church-singing of the Franks; while he required that sermons should be preached in the language of the people. Thus he diligently promoted popular education, while he strove to make up by study what he had lost by the neglect of his own culture in youth. He gathered men of learning—poets, historians, and copyists—around him, the most prominent of them being Anglo-Saxons, of whom the wise and pious Alcuin was chief. Even when an old man, he found time, though often only at night, to practice in writing his hand so accustomed to the sword; and having long been familiar with the Latin language, which he tried to diffuse among the people, undertook to learn the Greek also. He highly esteemed his native language, too. He gave German names to the months and the winds; caused a German grammar to be compiled; and took pains to collect the ancient heroic songs of the German minstrels, though his son, in his monkish zeal, destroyed them. He revered the clergy highly: granted them tithes throughout the empire, and everywhere watched over the increasing endowments and estates of the Church, in whose possessions at that time both agriculture and morality were better cared for than elsewhere. Most of the bishops and abbots were selected by the king himself.

Charlemagne's personal character must not be judged by the standards of a time so remote from him as ours. He has been called dissolute; and it is true that he utterly disregarded the marriage tie, when it would limit either his pleasures or his ambition. He married five wives, only to dishonor them. He even encouraged, as it seems, his own daughters to live loose lives at home; refusing to give them in marriage to princes, lest their husbands might become competitors for a share of the kingdom. But he was never controlled by his favorite women, nor did he neglect state business for indulgence. Charlemagne has been censured as cruel; and, indeed, there are few acts recorded in history of more wanton cruelty than his slaughter in cold blood of thousands of Saxons at Verden. Yet this was not done in the exercise of passion or hatred, but as a measure of policy, a means deliberately devised to secure a definite end, in which it was successful. Charlemagne was never cruel upon impulse; but his inclinations were to gentleness and kindness. The key to his character is his unbounded ambition. In the pursuit of power he knew no scruple; the most direct and efficient means were always the right means to him. There is no doubt of his earnest attachment to the Christian Church and to the orthodox doctrines, as he understood them. But this

*Menzes.

was not associated with an appreciation of Christian morality, or a sense of human brotherhood. His passion for conquest was in large part a fanatical zeal for the propagation of a religion which he regarded as inseparable from his empire.

Charlemagne was held in high honor by foreign nations. The Caliph of Bagdad, Haroun-al-Raschid, wielded in the East a power comparable with his own. To Charlemagne he sent a friendly embassy, with precious gifts, and it was reciprocated in the same spirit. The kings of the Normans expressed their respect for him in a similar way. But his own taste esteemed the ring of a good sword more than gold. His person and his private life have been vividly depicted to us by Einhard (Eginhard), a youth educated at his court, to whom, according to legend, the emperor gave one of his daughters for a wife. Charlemagne was tall and strongly formed, measuring from crown to sole seven times the length of his own foot. He had an open brow, very large, quick eyes, an abundance of fine hair, which was white in his last years, and a cheerful countenance.*

RESULTS OF HIS WARS AND RULE.

Some writers have sought to represent Charlemagne as a royal sage, a pacific prince, who only took up arms in self-defense. Truth compels a more faithful though less flattering portraiture. He had no invasion to dread. The Saracens were scattered, the Avars (Bavarians) weakened, and the Saxons impotent to carry on any serious war beyond their forests and marshes. If he led the Franks beyond their own frontiers, it was that he had, like so many other monarchs, the ambition of reigning over more nations, and of leaving a high-sounding name to posterity. All that he attempted beyond the Pyrenees proved abortive. It would have been of greater value had he subdued the Bretons, so far as to have made them sooner enter French nationality, instead of contenting himself with a precarious submission. The conquest of the Lombard kingdom profited neither France nor Italy, but only the Pope, whose political position it raised, and whose independence it secured for the future. The country for which those long wars had the happiest result, was that one which had suffered most from them, Germany. Before Charlemagne, Almayne was still Germany—that is to say, a shapeless chaos of pagan or Christian tribes, but all barbarian, enemies of one another, united by no single tie. There were Franks, Saxons, Thuringians, and Bavarians. After him there was a German people, and there will be a kingdom of Germany. It was great glory for him to have created a people—a glory which few conquerors have acquired; for they destroy much more than they found. His reign lasted forty-four years, and may be summed up as an immense and glorious effort to bring under subjection the barbarian world and all that which survived the Roman civilization; to put an end to the chaos born of invasion, and to found a settled state of society in which the authority of the emperor, closely united to that of the Pope, should maintain order alike in Church and State—a very difficult problem, which it was given Charlemagne to solve, but of which all the difficulties did not become apparent until after his death. The work of Charlemagne, in fact, did not last. The name of this powerful though rude genius is not the less surrounded with a lasting glory; and it has remained in the memory of nations with that of three or four other great men who have done, if not always the greatest amount of good, at least have made the most noise in the world. As to Charlemagne, the amount of good accomplished very far surpasses that which was only vain renown and sterile ambition. He created modern Germany; and if that chain of nations, the links of which he had sought to rivet, broke, his great image loomed over the feudal times as the genius of order, continually inviting the dispersed races to emerge from chaos, and seek union and peace under the sway of a strong and renowned chief.

*Lewis.

Charlemagne died, January 28, 814, in his seventy-second year, and was buried at Aix-la-Chapelle, in a church which he had built there after his Italian conquests, in the Lombard style. Eginhard, his secretary and friend, who wrote his life, tells us that he was considerably above six feet in height, and well proportioned in all respects, excepting that his neck was somewhat too short and thick. His imperial crown, which is still preserved at Vienna, would fit only the head of a giant. His air was dignified, but at the same time his manners were social. Charlemagne had no fewer than five wives; of his four sons, only one survived him, Louis, the youngest and most incapable, who succeeded him on the imperial throne.*

[To be continued.]

*Menzies.

EXTRACTS FROM GERMAN LITERATURE.

WALTHER VON DER VOGELWEIDE.

As an introduction to a brief extract upon Walther von der Vogelweide, we give Longfellow's beautiful little poem:

WALTHER VON DER VOGELWEIDE.

Vogelweide the Minnesinger,
When he left this world of ours,
Laid his body in the cloister,
Under Würzburg's minster towers.

And he gave the monks his treasures,
Gave them all with this behest:
They should feed the birds at noontide
Daily on his place of rest;

Saying, "From these wandering minstrels
I have learned the art of song;
Let me now repay the lessons
They have taught so well and long."

Thus the bard of love departed;
And, fulfilling his desire,
On his tomb the birds were feasted
By the children of the choir.

Day by day, o'er tower and turret,
In foul weather and in fair,
Day by day, in vaster numbers,
Flocked the poets of the air.

On the tree whose heavy branches
Overshadowed all the place,
On the pavement, on the tombstone,
On the poet's sculptured face,

On the cross-bars of each window,
On the lintel of each door,
They renewed the War of Wartburg,
Which the bard had fought before.

There they sang their merry carols,
Sang their lauds on every side;
And the name their voices uttered
Was the name of Vogelweide.

Till at length the portly abbot
Murmured, "Why this waste of food?
Be it changed to loaves henceforward
For our fasting brotherhood."

Then in vain o'er tower and turret,
From the walls and woodland nests,
When the minster bells rang noontide,
Gathered the unwelcome guests.

Then in vain, with cries discordant,
Clamorous round the Gothic spire,
Screamed the feathered Minnesingers
For the children of the choir.

Time has long effaced the inscriptions
On the cloister's funeral stones,
And tradition only tells us
Where repose the poet's bones.

But around the vast cathedral,
By sweet echoes multiplied,
Still the birds repeat the legend,
And the name of Vogelweide.

Walther's lyrical poems are distinguished from those of most of his contemporaries by a strong impress of sincerity and a wide range of thought.

When he hails the coming of the spring after a long winter, he imitates in the gladness of his heart the carols of the birds, and goes on in melodious verses to speak of the beauty of the lady to whom he dedicates his song, but whom he never names. In the next song the reader, to his surprise, will find the minstrel changed into a satirist, who denounces the political and religious corruptions of his time, rebukes the Pope for his worldly ambition and predicts a speedy ruin of the world. These are not all the notes of the scale on which his songs are constructed. As a specimen of his lighter and more popular style, the following strophe in praise of German women may serve:

In many foreign lands I've been
And knights and ladies there have seen;
But here alone I find my rest—
Old Germany is still the best;
Some other lands have pleased me well;
But here—'tis here I choose to dwell.
German men have virtues rare,
And German maids are angels fair.

He rises to a higher strain than this in other lyrics, where he places domestic virtue above external beauty, and speaks of *minne* in the higher interpretation of the word. "Even where it can not be returned," he says, "if devoted to one worthy of it, it ennobles a man's life. His affection for one teaches him to be kind and generous to all." Walther pleasantly describes himself as by no means good-looking, and censures all praise bestowed on men for their merely exterior advantages. And he is no fanatical worshiper of feminine beauty, affirming that it may sometimes be a thin mask worn over bad passions.

With regard to their moral and social purport the verses of Walther have a considerable historical interest. They show us how insecurely the Church held the faith and loyalty of German men in the thirteenth century.

Walther is bold and violent in his defiance and contempt of the Pope's usurpation of temporal authority. Referring in one place to a fable commonly believed in his times, he says: "When Constantine gave the spear of temporal power, as well as the spear and the crown to the See of Rome, the angels in heaven lamented, and well they might; for that power is now abused to annoy the emperor and to stir up the princes, his vassals against him." The poet was as earnest in dissuading the people from contributing money to support the Crusades. "Very little of it," he says, "will ever find its way into the Holy Land. The Pope is now filling his Italian coffers with our German silver." This saying seems to have been very popular for a tame moralist who lived in Walther's time complains that, by making such statements, the poet was perverting the faith of many people. "All his fine verses," the moralist adds, "will not atone for that bad libel on Rome." Yet the author of it was quite orthodox in doctrine, and was enthusiastic in his zeal for rescuing the Holy Sepulcher from the Saracens.

Many of his verses express earnestly his love for his native land, and his grief for social and political disorders of his

times. He believes that the world is falling a prey to anarchy. "I hear the rushing of the water," he says, "and I watch the movements of the fish that swim in its depth. I explore the habits of the creatures of this world in the forest and in the field, from the beast of the field down to the insect, and I find that there is nowhere any life that is not vexed by anarchy and strife. Warfare is found everywhere, and yet some order is preserved even among animals; but in my own native land, where the petty princes are lifting themselves up against the emperor, we are hastening on to anarchy." The course of events proved that he was too true in this prediction. Resignation and despair, rather than any hope of a reconciliation of religion with practical life, characterize other meditative poems. The following is one of the best of this class:

I sat one day upon a stone,
And meditated long, alone,
While resting on my hand my head,
In silence to myself I said:
"How, in these days of care and strife,
Shall I employ my fleeting life?
Three precious jewels I require
To satisfy my heart's desire:
The first is honor, bright and clear,
The next is wealth, and far more dear,
The third is heaven's approving smile;"
Then, after I had mused a while
I saw that it was vain to pine
For these three pearls in one small shrine;
To find within one heart a place
For honor, wealth, and heavenly grace;
For how can one in days like these
Heaven and the world together please?

—From "*Outlines of German Literature*"—Gostwick and Harrison.

HANS SACHS.

Riches of Poverty.

Why art thou cast down, my heart?
Why trouble, why dost mourn apart,
O'er naught but earthly wealth?
Trust in thy God, be not afraid,
He is thy friend, who all things made!

Dost think thy prayers he doth not heed?
He knows full well what thou dost need;
And heaven and earth are his!
My Father and my God, who still
Is with my soul in every ill.

The rich man in his wealth confides;
But in my God my trust abides.
Laugh as ye will, I hold
This one thing fast, that He hath taught:
Who trusts in God shall want for naught.

Yes, Lord: thou art as rich to-day
As thou hast been, and shall be aye:
I rest on thee alone;
Thy riches to my soul be given,
And 'tis enough for earth and heaven.

The legends of Hans Sachs are all pointed with satire. Readers now-a-days find in them a coarseness which jars their ideas of reverence and refinement, but which in the sixteenth century was in perfect keeping with the popular taste. One of the best of his legends is that of "St. Peter and the Goat." "We are told that once upon a time St. Peter was perplexed by an apparent prevalence of injustice in the world; and ventured to think that he could arrange matters better if he held the reins of government. He frankly confesses these thoughts to his Master. Meanwhile a peasant girl comes to him and complains that she has to do a hard day's work, and at the same time to

keep in order a frolicsome young goat. 'Now,' says the Lord to Peter, 'you must have pity on this girl, and must take charge of the goat. That will serve as an introduction to your managing the affairs of the universe.'"

The legend goes on :

"The young goat had a playful mind
And never liked to be confined;
The Apostle at a killing pace,
Followed the goat, in a desperate chase;
Over the hills and among the briers
The goat runs on and never tires,
While Peter, behind, on the grassy plain,
Runs on, panting and sighing in vain.
All day, beneath a scorching sun,
The good Apostle had to run
Till evening came; the goat was caught
And safely to the Master brought,
Then, with a smile, to Peter said
The Lord: 'Well, friend, how have you sped?
If such a task your powers has tried
How could you keep the world so wide?'
Then Peter, with his toil distressed,
His folly, with a sigh, confessed;
'No, Master, 'tis for me no play
To rule one goat for one short day;
It must be infinitely worse
To regulate the universe.'"

MARTIN LUTHER.

The Book of Psalms.

The heart of man is like a ship out on a wild sea, and driven by storm-winds blowing from all the four quarters of the world; now impelled by fear and care for coming evil, now disturbed by vexation and grief for present misfortune, now urged along by hope and a confidence of future good, now wafted by joy and contentment. These storm-winds of the soul teach us how to speak in good earnest, to open our hearts and to utter their contents. The man actually in want and fear does not express himself quietly, like a man who only talks about fear and want; a heart filled with joy utters itself and sings in a way not to be imitated by one who is all the time in fear; "It does not come from the heart," men say, when a sorrowful man tries to laugh, or a merry man would weep. * * * Now of what does this book of Psalms mostly consist but of earnest expressions of the heart's emotions—the storm-winds, as I have called them? Where are finer expressions of joy than the Psalms of praise and thanksgiving? There you look into the hearts of the saints, as if you looked into a fair and delightful garden, aye, or into heaven itself—and you see how lovely and pleasant flowers are springing up there out of manifold happy and beautiful thoughts of God and all His mercies. * * * But again, where will you find deeper, more mournful and pitiful words of sorrow than in the Psalms devoted to lamentation? I conclude then that the Psalter is a hand-book for religious men, wherein every one, whatever may be his condition, may find words that will rhyme with it; and Psalms as exactly fitted to suit his wants as if they had been written solely for his benefit.—*From the Preface to Luther's Book of Psalms.*

Light in Despondency.

When the sky is black and lowering, when thy path in life is drear,
Upward lift thy steadfast glances, 'mid the maze of sorrow here.
From the beaming Fount of Gladness shall descend a radiance bright,
And the grave shall be a garden, and the house of darkness light,
For the Lord will hear and answer when in faith his people pray;
Whatsoe'er he hath appointed shall but work thee good alway.
E'en thy very hairs are numbered, God commands when one shall fall;
And the Lord is with his people, helping each and blessing all.

Our Defense.

A strong tower is the Lord our God,
To shelter and defend us;
Our shield his arm, our sword his rod
Against our foes befriending us.
That ancient enemy—
His gathering powers we see,
His terror and his toils;
Yet victory with its spoils
Not earth but heaven shall send us!

Though wrestling with the wrath of hell,
No might of man avail us,
Our captain is Immanuel,
And angel comrades hail us!
Still challenge ye his name?
"Christ in the flesh who came"—
The Lord, the Lord of Hosts!
Our cause his succor boasts;
And God shall ne'er fail us!

While mighty truth with us remain,
Hell's arts shall move us never;
Nor parting friendship, honors, gains,
Our love from Jesus sever:
They leave us when they part
With him a peaceful heart;
And when from dust we rise,
Death yields us as he dies,
The crown of life forever!

GOTTHOLD EPHRAIM LESSING.

The Parable of "The Three Kings," from "Nathan the Wise."

In the oldest times, and in an eastern land,
There lived a man who had a precious ring.
This gem—an opal of a hundred tints—
Had such a virtue as would make the wearer
Who trusted it, beloved by God and man.
What wonder, if the man who had this ring
Preserved it well, and, by his will, declared
It should forever in his house remain?
At last when death came near, he called the son
Whom he loved best, and gave to him the ring,
With one strict charge:—"My son, when you must die,
Let this be given to your own darling child—
The son whom you love best, without regard
To any rights of birth."—'Twas thus the ring
Was always passed on to the best-beloved.
Sultaun! you understand me?

Saladin. Yea. Go on!—

Nathan. A father, who, at last possessed this ring
Had three dear sons—all dutiful and true—
All three alike beloved.—But, at one time,
This son, and then another, seemed most dear—
Most worthy of the ring; and it was given,
By promise, first to this son, then to that,
Until it might be claimed by all the three.
At last, when death drew nigh, the father felt
His heart distracted by the doubt to whom
The ring was due. He could not favor one
And leave two sons in grief! How did he act?
He called a goldsmith in, gave him the gem,
And bade him make exactly of that form,
Two other rings, and spare nor cost nor pains
To make all three alike. And this was done
So well, the owner of the first, true ring,
Could find no shade of difference in the three.
And now he called his sons—one at a time—
He gave to each a blessing and a ring—
One of the three—and died—

Saladin. Well, well. Go on.

Nathan. My tale is ended. You may guess the sequel :—
The father dies; immediately each son
Comes forward with his ring, and asks to be
Proclaimed as head and ruler of the house;
All three assert one claim, and show their rings—
All made alike. To find the first—the true—
It was as great a puzzle as for us—
To find the one true faith.

Saladin. Is that, then, all the answer I must have?

Nathan. 'Tis my apology, if I decline
To act as judge, or to select the ring—
The one, true gem, of three all made alike;
All given by one—

Saladin. There! talk no more of "rings."
The three religions, that, at first, were named,
Are all distinct—aye, down to dress—food—drink—

Nathan. Just so! and yet their claims are all alike,
As founded upon history, on facts
Believed, and handed down from sire to son,
Uniting them in faith. Can we—the Jews—
Distrust the testimony of our race?
Distrust the men who gave us birth, whose love
Did ne'er deceive us; but when we were babes,
Taught us, by means of fables, for our good?
Must *you* distrust your own true ancestors,
To flatter mine?—or must a Christian doubt
His father's words, and so agree with ours?—

Saladin. Allah!—the Israelite is speaking truth,
And I am silenced—

Nathan. Let me name the rings
Once more!—The sons at last, in bitter strife,
Appeared before a judge, and each declared
He had the one true gem, given by his father;
All said the same, and all three spoke the truth;
Each, rather than suspect his father's word,
Accused his brethren of a fraud—

Saladin. What then?
What sentence could the judge pronounce? Go on.

Nathan. Thus said the judge:—"Go, bring your father here;
Let him come forth! or I dismiss the case.
Must I sit guessing riddles? Must I wait
Till the true ring shall speak out for itself?—
But stay!—'twas said that the authentic gem
Had virtue that could make its wearer loved
By God and man. That shall decide the case.
Tell me who of the three is best beloved
By his two brethren. Silent?—Then the ring
Hath lost its charm!—Each claimant loves himself,
But wins no love. The rings are forgeries;
'Tis plain, the first, authentic gem was lost;
To keep his word with you, and hide his loss,
Your father had these three rings made—these three,
Instead of one—"

Saladin. Well spoken, judge, at last!

Nathan. "But stay," the judge continued; "hear one word—
The best advice I have to give; then go—
Let each still trust the ring given by his father!—
It might be, he would show no partial love;
He loved all three, and, therefore, would not give
The ring to one and grieve the other two.
Go, emulate your father's equal love.
Let each first test his ring and show its power;
But aid it, while you test; be merciful,
Forbearing, kind to all men, and submit
Your will to God. Such virtues shall increase
Whatever powers the rings themselves may have;
When these, among your late posterity,
Have shown their virtue—in some future time,
A thousand thousand years away from now—
Then hither come again!—A wiser man

Than one now sitting here will hear you then,
And will pronounce the sentence."

Saladin. Allah! Allah!

Nathan. Now, Saladin, art thou that "wiser man?"
Art thou the judge who will, at last, pronounce
The sentence?

[*Saladin grasps Nathan's hand, and holds
to the end of the conversation.*]

Saladin. I the judge?—I'm dust! I'm nothing!
'Tis Allah!—Nathan, now I understand;
The thousand thousand years have not yet passed;
The judge is not yet come; I must not place
Myself upon his throne! I understand—
Farewell, dear Nathan! Go.—Be still my friend.

READINGS IN PHYSICAL SCIENCE.*

III.—RIVERS AND GLACIERS.

We have found that the water of the river is largely derived from springs, and that all spring-water contains more or less mineral materials dissolved out of the brooks. Every river, therefore, is carrying not merely water, but large quantities of mineral matters into the sea. It has been calculated, for instance, that the Rhine in one year carries into the North Sea lime enough to make three hundred and thirty-two thousand millions of oyster shells. This chemically-dissolved material is not visible to the eye, and in no way affects the color of the water. At all times of the year, as long as the water flows, this invisible transport of some of the materials of rocks must be going on.

But let us now again watch the same river in flood. The water is no longer clear, but dull and dirty. You ascertained that this discoloration arises from mud and sand suspended in the water. You see that over and above the mineral matter in chemical solution, the river is hurrying seaward with vast quantities of other and visible materials. And thus it is clear that at least one great part of the work of rivers must be to transport the mouldered parts of the land which are carried into them by springs or by rain.

But the rivers, too, help in the general destruction of the surface of the land. Of this you may readily be assured, by looking at the sides or bed of a stream when the water is low. Where the stream flows over hard rock, you find the rock all smoothed and ground away; and the stones lying in the water-course are all more or less rounded and smoothed. When these stones were originally broken by frosts or otherwise, from crags and cliffs, they were sharp-edged, as you can prove by looking at the heaps of blocks lying at the foot of any precipice, or steep bank of rock. But when they fell, or were washed into the river, they began to get rolled and rubbed, until their sharp edges were ground away, and they came to wear the smooth rounded forms which we see in the ordinary gravel.

While the stones are ground down, they, at the same time, grind down the rocks which form the sides and bottom of the river-channel over which they are driven. You can even see in some of the eddies of the stream how the stones are kept moving round until they actually excavate deep round cavities, called pot-holes, in the solid rock.

Now, it is clear that two results must follow from this ceaseless wear and tear of rocks and stones in the channel of a stream. In the first place, a great deal of mud and sand must be produced; and, in the second place, the bed of the river must be ground down so as to become deeper and wider. The sand and mud are added to the other similar material washed into the streams by rain from the mouldering surface of the land. By the deepening and widening of the water-courses, such picturesque features as gorges and ravines are excavated out of the solid rock.

*Abridged from Science Primer on Physical Science, by Prof. Geikie.

Look, again, at the channel of a river in summer. You see it covered with sheets of gravel in one place, beds of sand in another, while here and there a piece of hard rock sticks up through these different kinds of river-stuff. Note some portion of the loose materials, and you find it to be continually shifting. A patch of gravel or sand may remain for a time, but the little stones and grains of which it is made up are always changing as the water covers and moves them. In fact, the loose materials over which the river flows are somewhat like the river itself. You come back to its banks after many years, and you find the river there still, with the same ripples, and eddies, and gentle murmuring sound. But though the river has been there constantly all the time, its water has been changing every minute, as you can watch it changing still. So, although the channel is always more or less covered with loose materials, these are not always the same. They are perpetually being pushed onward, and others, from higher up the stream, come behind to take their place.

It is not in the bottoms of the rivers, then, that the material worn away from the surface of the land can find any lasting rest. And yet the rivers do get rid of a good deal of this material as they roll along. You have, perhaps, noticed that a river is often bordered with a strip of flat plain, the surface of which is only a few feet above the level of the water. Most of our rivers have such margins, and, indeed, seem each to wind to and fro through a long, level, meadow-like plain. Now this plain is really made up from the finer particles of decomposed rocks which the river has carried along. During floods, the river, swollen and muddy, rises above its banks, and spreads over the low ground on either side. Whenever this takes place, the overflowing water moves more slowly over the flats; and, as its current is thus checked, it can not hold so much mud and sand, but allows some of these materials to settle down to the bottom. In this way the overflowed tracts get a coating of soil laid over them by the river, and when the waters retire this coating adds a little to the height of the plain. The same thing takes place year after year, until by degrees the plain gets so far raised that the river, which all this while is also busy deepening its channel, can not overflow it even at the highest floods. In course of time the river, as it winds from side to side, cuts away slices of the plain and forms a newer one at a lower level. And thus a series of terraces is gradually made, rising step by step above the river.

Still the laying down of its sand and mud by a river to form one or more such river-terraces is, after all, only a temporary disposal of these materials. They are still liable to be carried away, and in truth they are carried off continually as the river eats away its banks.

When the current of a river is checked as it enters the sea or a lake, the feebler flow of the water allows the sand and mud to sink to the bottom. By degrees some portions of the bottom come in this way to be filled up to the surface of the river, and wide flat marshy spaces are formed on either side of the main stream. During floods these spaces are overflowed with muddy water, in the same way as in the case of the valley plains just described, and a coating of mud or sand is laid down on them until they slowly rise above the ordinary level of the river, which winds about among them in endless branching streams. Vegetation springs up on these flat swampy lands; animals, too, find food and shelter there; and thus a new territory is made by the work of the river.

These flat river-formed tracts are called *deltas*, because the one which was best known to the ancients, that of the Nile, had the shape of the Greek letter Δ (*delta*). This is the general form which is taken by accumulations at the mouths of rivers; the flat delta gets narrow toward the inland, and broader toward the sea. Some of them are of enormous size; the delta of the Mississippi, for example.

Each delta, then, is made of materials worn from the surface of the land, and brought down by the river. And yet vast

though some of these deltas are, they do not show all the materials which have been so worn away. A great deal is carried far out and deposited on the sea-bottom; for the sea is the great basin into which the spoils of the land are continually borne.

Having now followed the course taken by the water which falls on the land as rain, we come to that taken by snow.

On the tops of some of the highest mountains in Britain snow lies for great part of the year. On some of them, indeed, there are shady clefts wherein you may meet with deep snow-wreaths even in the heat of summer.

But in other parts of Europe, where the mountains are more lofty, the peaks and higher shoulders of the hills gleam white all the year with unmelted snow.

Let us see why it is that perpetual snow should occur in such regions, and what part this snow plays in the general machinery of the world.

You have learned that the higher parts of the atmosphere are extremely cold. You know also that in the far north and the far south, around those two opposite parts of the earth's surface called the Poles, the climate is extremely cold—so cold as to give rise to dreary expanses of ice and snow, where sea and land are frozen, and where the heat of summer is not enough to thaw all the ice and drive away all the snow. Between these two polar tracts of cold, wherever mountains are lofty enough to get into the high parts of the atmosphere where the temperature is usually below the freezing-point, the vapor condensed from the air falls upon them, not as rain, but as snow. Their heads and upper heights are thus covered with perpetual snow. In such high mountainous regions the heat of the summer always melts the snow from the lower hills, though it leaves the higher parts still covered. From year to year it is noticed that there is a line or limit below which the ground gets freed of its snow, and above which the snow remains. This limit is called the snow-line, or the limit of perpetual snow. Its height varies in different parts of the world. It is highest in the warmer regions on either side of the equator, where it reaches to 15,000 feet above the sea. In the cold polar tracts, on the other hand, it approaches the sea-level. In other words, while in the polar tracts the climate is so cold that perpetual snow is found even close to the sea-level, the equatorial regions are so warm that you must climb many thousand feet before you can reach the cold layers of the air where snow can remain all the year.

There is, you see, one striking difference between rain and snow. If rain had been falling for the same length of time, the roads and fields would still have been visible, for each drop of rain, instead of remaining where it fell, would either have sunk into the soil, or have flowed off into the nearest brook. But each snowflake, on the contrary, lies where it falls, unless it happens to be caught up and driven on by the wind to some other spot where it can finally rest. Rain disappears from the ground as soon as it can; snow stays still as long as it can.

You will see at once that this marked difference of behavior must give rise to some equally strong differences in the further procedure of these two kinds of moisture. You have followed the progress of the rain; now let us try to find out what becomes of the snow.

In such a country as ours, where there is no perpetual snow, you can without much difficulty answer this question. Each fall of snow in winter-time remains on the ground as long as the air is not warm enough to melt it. Evaporation, indeed, goes on from the surface of snow and ice, as well as from water: so that a layer of snow would in the end disappear, by being absorbed into the air as vapor, even though none of it had previously been melted into running water. But it is by what we call a thaw that our snow is chiefly dissipated; that is, a rise in the temperature, and a consequent melting of the snow. When the snow melts, it sinks into the soil and flows off into brooks in the same way as rain.

In the regions of perpetual snow the heat of summer can not

melt all the snow which falls there in the year. What other way of escape, then, can the frozen moisture find?

You will remember that the surplus rainfall flows off by means of rivers. Now the surplus snow-fall above the snow-line has a similar kind of drainage. It flows off by means of what are called glaciers.

When a considerable depth of snow has accumulated, the pressure upon the lower layers from what lies above them squeezes them into a firm mass. The surface of the ground is usually sloped in some direction, seldom quite flat. And among the high mountains the slopes are often, as you know, very steep. When snow gathers deeply on sloping ground, there comes a time when the force of gravity overcomes the tendency of the pressed snow to remain where it is, and then the snow begins to slide slowly down the slope. From one slope it passes on downward to the next, joined continually by other sliding masses from neighboring slopes until they all unite into one long tongue which creeps slowly down some valley to a point where it melts. This tongue from the snow-fields is the glacier. It really drains these snow-fields of their excess of snow as much as a river drains a district of its excess of water.

But the glacier which comes out of the snow-fields is itself made not of snow, but of ice. The snow, as it slides downward, is pressed together into ice. You have learned that each snowflake is made of little crystals of ice. A mass of snow is thus only a mass of minute crystals of ice with air between. Hence when the snow gets pressed together, the air is squeezed out, and the separated crystals of ice freeze together into a solid mass. You know that you can make a snowball very hard by squeezing it firmly between the hands. The more tightly you press it the harder it gets. You are doing to it just what happens when a glacier is formed out of the eternal snows. You are pressing out the air, and allowing the little particles of ice to freeze to each other and form a compact piece of ice. But you can not squeeze nearly all the air out, consequently the ball, even after all your efforts, is still white from the imprisoned air. Among the snowfields, however, the pressure is immensely greater than yours; the air is more and more pressed out, and at last the snow becomes clear transparent ice.

A glacier, then, is a river, not of water, but of ice, coming down from the snow-fields. It descends sometimes a long way below the snow-line, creeping down very slowly along the valley which it covers from side to side. Its surface all the time is melting during the day in summer, and streams of clear water are gushing along the ice, though, when night comes, these streams freeze. At last it reaches some point in the valley beyond which it can not go, for the warmth of the air there is melting the ice as fast as it advances. So the glacier ends, and from its melting extremity streams of muddy water unite into a foaming river, which bears down the drainage of the snow-fields above.

A river wears down the sides and bottom of its channel, and thus digs out a bed for itself in even the hardest rock, as well as in the softest soil. It sweeps down, too, a vast quantity of mud, sand, and stones from the land to the sea. A glacier performs the same kind of work, but in a very different way.

When stones fall into a river they sink to the bottom, and are pushed along there by the current. When mud enters a river it remains suspended in the water, and is thus carried along. But the ice of a glacier is a solid substance. Stones and mud which fall upon its surface remain there, and are borne onward with the whole mass of the moving glacier. They form long lines of rubbish upon the glacier, and are called moraines. Still the ice often gets broken up into deep cracks, opening into yawning clefts or crevasses, which sometimes receive a good deal of the earth and stones let loose by frost or otherwise from the sides of the valley. In this way loose materials fall to the bottom of the ice, and reach the solid floor of the valley down which the ice is moving; while at the same time similar rubbish

tumbles between the edge of the glacier and the side of the valley.

The stones and grains of sand which get jammed between the ice and the rock over which it is moving are made to score and scratch this rock. They form a kind of rough polishing powder, whereby the glacier is continually grinding down the bottom and sides of its channel. If you creep in below the ice, or catch a sight of some part of the side from which the ice has retired a little, you will find the surface of the rock all rubbed away and covered with long scratches made by the sharp points of the stones and sand.

You will now see the reason why the river, which escapes from the end of a glacier, is always muddy. The bottom of the glacier is stuck all over with stones, which are scraping and wearing down the rock underneath. A great deal of fine mud is thus produced, which, carried along by streams of water flowing in channels under the glacier, emerges at the far end in the discolored torrents which there sweep from under the ice.

A glacier is not only busy grinding out a bed for itself through the mountains; it bears on its back down the valley enormous quantities of fallen rock, earth and stones, which have tumbled from the cliffs on either side. In this way blocks of rock as big as a house may be carried for many miles, and dropped where the ice melts. Thousands of tons of loose stones and mud are every year moved on the ice from the far snowy mountains away down into the valleys to which the glaciers reach.

The largest glaciers in the world are those of the polar regions. North Greenland, in truth, lies buried under one great glacier, which pushes long tongues of ice down the valleys and away out to sea. When a glacier advances into the sea, portions of it break off and float away as icebergs. So enormous are the glaciers in these cold tracts that the icebergs derived from them often rise several hundred feet above the waves which beat against their sides. And yet, in all such cases, about seven times more of the ice is immersed under water than the portion, large as it is, which appears above. You can realize how this happens if you take a piece of ice, put it in a tumbler of water, and watch how much of it rises out of the water. Sunk deep in the sea, therefore, the icebergs float to and fro until they melt, sometimes many hundreds of miles away from the glaciers which supplied them.

You will come to learn afterward that, once upon a time, there were glaciers in Britain. You will be able with your own eyes to see rocks which have been ground down and scratched by the ice, and big blocks of rock and piles of loose stones which the ice carried upon its surface. So that, in learning about glaciers, you are not merely learning what takes place in other and distant lands, you are gaining knowledge which you will be able by and by to make good use of, even in your own country.

SUNDAY READINGS.

SELECTED BY THE REV. J. H. VINCENT, D.D.

[December 2.]

FROM THE "CHRISTIAN'S PATTERN."

By THOMAS À KEMPIS.

"He that followeth me walketh not in darkness, saith the Lord." These are the words of Christ, by which we are admonished that we ought to imitate his life and manners, if we would be truly enlightened and delivered from all blindness of heart.

Let therefore our chief endeavor be to meditate upon the life of Jesus Christ.

What will it avail thee to dispute sublimely of the Trinity, if thou be void of humility, and art thereby displeasing to the Trinity?

Truly, sublime words do not make a man holy and just ; but a virtuous life maketh him dear to God.

I had rather feel compunction, than know the definition thereof.

If thou didst know the whole Bible, and the sayings of all the philosophers, by heart, what would all that profit thee without the love of God ?

Vanity of vanities ! all is vanity, but to love God and serve him only.

It is therefore vanity to seek after perishing riches.

It is also vanity to seek honors.

It is vanity to follow the desires of the flesh, and to labor for that for which thou must afterward suffer grievous punishment.

It is vanity to wish to live long, and to be careless to live well.

It is vanity to mind this present life, and not those things which are to come.

It is vanity to set thy love on that which speedily passeth away, and not to hasten thither, where everlasting joys remain.

All men naturally desire to know ; but what availeth knowledge without the fear of God ?

Surely an humble husbandman that serveth God is better than a proud philosopher, that, neglecting himself, studies the course of the heavens.

He that knoweth himself is vile in his own eyes, and is not pleased with the praises of men.

If I understood all things in the world, and had not charity, what would that help me in the sight of God, who will judge me according to my deeds.

There are many things, to know which doth little profit the soul.

And he is very unwise, that minds any other things than those that tend to the welfare of his soul.

Many words do not satisfy the soul ; but a pure conscience giveth confidence toward God.

The more thou knowest, and the better thou understandest, the more grievously shalt thou be judged, unless thy life be the more holy.

Be not therefore lifted up ; but rather let the knowledge given thee make thee afraid.

If thou thinkest that thou knowest much : yet there are many more things which thou knowest not.

Be not over wise, but rather acknowledge thine own ignorance.

The highest and most profitable lesson is, the true knowledge of ourselves.

It is great wisdom to esteem ourselves nothing, and to think always well and highly of others.

We are all frail, but remember, none more frail than thyself.

[December 9.]

It is good that we be sometimes contradicted ; and that men think ill of us, and this, although we do not intend well.

For then we more diligently seek God for our inward witness, when outwardly we are contemned by men.

Wherefore a man should settle himself so fully in God, that he need not seek comforts of men.

When a man is afflicted, tempted, or troubled with evil thoughts ; then he understandeth better the great need he hath of God.

So long as we live in this world, we can not be without temptation.

Hence it is written in Job, "The life of man is a warfare upon earth."

Temptations are often very profitable to men, though they be troublesome and grievous ; for in them a man is humbled, purified, and instructed.

All the saints have passed through, and profited by, many tribulations, and temptations :

And they that could not bear temptations, became reprobates and fell away.

There is no place so secret, where there are no temptations.

There is no man that is altogether secure from temptations while he liveth.

When one temptation goeth away, another cometh ; and we shall ever have something to suffer.

Many seek to fly temptations, and fall more grievously into them.

By flight alone we can not overcome, but by patience and humility we conquer all our enemies.

He that only avoideth them outwardly, and doth not pluck them up by the roots, shall profit little : yea, temptations will soon return unto him, and he shall feel them worse than before.

By patience (through God's help) thou shalt more easily overcome, than by harsh and disquieting efforts in thy own strength.

Often take counsel in temptations ; and deal not roughly with him that is tempted.

The beginning of temptation is inconstancy of mind, and little confidence in God.

For as a ship without a rudder is tossed to and fro with the waves, so the man that is negligent is many ways tempted.

Fire trieth iron, and temptation a just man.

We know not often what we are able to do : but temptations show us what we are.

We must be watchful, especially in the beginning of the temptation ; for the enemy is then more easily overcome, if he be not suffered to enter the door of your hearts, but be resisted without the gate at his first knock.

Wherefore one said, "Withstand the beginning : for an after remedy comes too late."

First, there occurreth to the mind a simple evil thought ; then a strong imagination ; afterward delight ; and lastly consent.

And so by little and little our malicious enemy getteth entrance, while he is not resisted in the beginning.

And the longer one is slack in resisting, the weaker he becomes daily, and the enemy stronger against him.

Some suffer the greatest temptation in the beginning of their conversion ; others in the latter end.

Others again are much troubled almost throughout their life.

Some are but slightly tempted, according to the wisdom which weigheth the states of men, and ordereth all things for the good of his elect.

We ought therefore, when we are tempted, so much the more fervently to pray unto God ; who surely will give with the temptation, a way to escape, that we may be able to bear it.

Let us therefore humble ourselves under the hand of God, in all temptations and tribulations ; for he will exalt the humble in spirit.

In temptations and afflictions a man is proved how much he hath profited.

Neither is it any such great thing if a man be devout and fervent, when he feelth no affliction ; but if in time of adversity he bear himself patiently, there is hope then of great proficiency.

Some are kept from great temptations, and are overcome in small ones ; that being humbled, they may never trust themselves in great matters, who are baffled in so small things.

[December 16.]

Turn thine eyes unto thyself, and beware thou judge not the deeds of other men.

In judging others a man laboreth in vain, often erreth, and easily sinneth ; but in judging and examining himself, he always laboreth fruitfully.

We often judge of things according as we fancy them : for affection bereaves us easily of a right judgment.

If God were always our desire, we should not be so much troubled when our inclinations were opposed.

But oftentimes something lurks within, which draweth us after it.

Many secretly seek themselves in their actions, but know it not.

They live in peace of mind when things are done according to their will: but if things succeed otherwise than they desire, they are straightway troubled.

Diversity of inclinations and opinions often causes dissensions between religious persons, between friends and countrymen.

An old custom is hardly broken, and no man is willing to be led farther than himself can see.

If thou dost more rely upon thine own reason, than upon Jesus Christ, late, if ever, shalt thou become illuminated.

The outward work without charity, profiteth nothing; but whatsoever is done out of charity, be it ever so little and contemptible in the sight of the world, is wholly fruitful.

For God weigheth more with how much love one worketh, than how much he doeth.

He doth much that loveth much.

He doth much that doth a thing well.

He doth well that serveth his neighbor, and not his own will.

Often it seemeth to be charity, and it is rather carnality; because natural inclinations, self-will, hope of reward, and desire of our own interest, are motives that men are rarely free from.

He that hath true and perfect charity seeketh himself in nothing; but only desireth in all things that God should be exalted.

He envieth none, because he seeketh not his own satisfaction; neither rejoiceth in himself, but chooses God only for his portion.

He attributes nothing that is good to any man, but wholly referreth it unto God, from whom, as from the fountain, all things proceed: in whom finally all the saints rest.

O that he had but one spark of true charity, he would certainly discern that all earthly things are full of vanity!

[December 23.]

When one that was in great anxiety of mind, often wavering between fear and hope, did once humbly prostrate himself in prayer, and said, O, if I knew that I should persevere! he presently heard within him an answer from God which said, If thou didst know it, what wouldst thou do? Do what thou wouldst do then, and thou shalt be safe.

And being herewith comforted and strengthened, he committed himself wholly to the will of God, and his anxiety ceased:

Neither had he any mind to search curiously farther what should befall him; but rather labored to understand what was the perfect and acceptable will of God, for the beginning and accomplishing every good work.

Hope in the Lord, and do good, saith the prophet, and inhabit the land, and thou shalt be fed.

One thing there is that draweth many back from a spiritual progress, and diligent amendment; the horror of the difficulty, or the labor of the combat.

But they improve most in virtue, that endeavor most to overcome those things which are grievous and contrary to them.

For there a man improveth more, and obtaineth greater grace, where he more overcometh himself and mortifieth himself in spirit.

Gather some profit to thy soul wheresoever thou art; so if thou seest or hearest of any good examples, stir up thyself to the imitation thereof.

But if thou seest anything worthy of reproof, beware thou doest not the same.—And if at any time thou hast done it, labor quickly to amend it.

Be mindful of the profession thou hast made, and have always before thine eyes the remembrance of thy Savior crucified.

Thou hast good cause to be ashamed, looking upon the life

of Jesus Christ, seeing thou hast as yet no more endeavored to conform thyself unto him, though thou hast walked a long time in the way of God.

A religious person that exerciseth himself seriously and devoutly in the most holy life and passion of our Lord shall there abundantly find whatsoever is necessary and profitable for him; neither shall he need seek any better thing out of Jesus.

A CHRISTMAS PRAYER.

Come thou O Lord, and dwell within me, giving me light, and love, and liberty. May the spirit of the sweet Christmas Child possess me! May the Star of Bethlehem abide above my dwelling place! May the angels who seek thee be drawn toward me, and surround my path! May their song fill my life. Glory to God in the highest. On earth peace, good will to men.

[December 30.]

This life will soon be at an end; consider therefore how thy affairs stand as to the next.

Man is here to-day; to-morrow he is gone.

When he is out of sight, he is soon forgotten.

Thou shouldst so order thyself in all thy thoughts and all thy actions, as if thou wert to die to-day.

Hadst thou a clear conscience, thou wouldst not fear death.

It were better to avoid sin than to fly death.

If thou art not prepared to-day, how wilt thou be to-morrow?

To-morrow is uncertain, and how knowest thou that thou shalt live till to-morrow?

What availeth to live long, when we are so little the better?

Alas! long life doth not always mend us; but often increaseth guilt.

O, that we had spent but one day well in this world!

When it is morning, think thou mayst die before night.

When evening comes, dare not to promise thyself the next morning.

Be therefore always in readiness; and so live that death may never take thee unprepared.

Many die suddenly, and when they look not for it; for "in such an hour as you think not, the Son of man cometh." Matt. xxiv. 44.

When that last hour shall come, thou wilt have a far different opinion of thy whole life.

How wise and happy is he, that laboreth to be such in his life as he would wish to be found at the hour of his death.

Whilst thou art in health, thou mayst do much good, but when thou art sick, I know not what thou wilt be able to do.

Few by sickness grow better; and they who travel much are seldom sanctified.

Trust not in friends and kindred, neither put off the care of thy soul till hereafter, for man will sooner forget thee than thou art aware of.

If thou art not careful for thyself now, who will be careful for thee hereafter?

The time present is very precious; now are the days of salvation, now is the acceptable time.

But alas! that thou shouldst spend thy time no better here, where thou mightest purchase life eternal. The time will come when thou shalt desire one day or hour to amend in, and I can not say it will be granted thee.

Ah fool! why dost thou think to live long, when thou canst not promise thyself one day!

How many have been deceived, and suddenly snatched away!

How often dost thou hear, such a man is slain, another is drowned, a third has broken his neck with a fall; this man died eating, and that playing?

One perished by fire, another by sword, another of the plague, another was slain by thieves! Thus death is the end of all, and man's life suddenly passeth away like a shadow.

Who shall remember thee when thou art dead? Do, do now, my beloved, whatsoever thou art able to do: for thou knowest not when thou shalt die, nor yet what shall be after thy death.

Now, while thou hast time, lay up for thyself everlasting riches.

Keep thy heart free, and lifted up to God, because thou hast here no abiding city.

Send thither thy daily prayers, and sighs, and tears, that after death thy spirit may happily pass to the Lord. *Amen.*

POLITICAL ECONOMY.

By G. M. STEELE, D.D.

III.

EXCHANGE.

1. Exchange is the mutual and voluntary transfer of the right of property held by different persons. This implies, (*a*) the existence of the *right of property*; (*b*) that the transfer must be *mutual*, otherwise there is no exchange; (*c*) that it be *voluntary*, otherwise it would be robbery.

2. The principles that form the basis of exchange are the same as those implied in the great law of association and individuality; namely, those which give rise to the combination and division of labor. There is usually some one kind of labor, or at most a few kinds, for which each individual is competent. But the variety of occupations so nearly corresponds with the variety of aptitudes in every well-ordered community, that each may, with little effort, find the calling to which he is suited.

But while each individual is thus limited in his productive capabilities, his claims and wants are nearly limitless. He is in need of a thousand commodities, only a very few of which he can produce. He depends for the remainder of these upon his fellow-men. On the other hand, he can produce a thousand times as much of the few kinds of commodities to which he devotes himself, as he himself needs. These he transfers to his fellow-men, taking in return the surplus of their several products. This is exchange, or commerce. It is implied in the very constitution of man. Association is an imperative condition of humanity.

3. A distinction is sometimes made between *commerce* and *trade*—a wise distinction, as it seems to me, though observed by but few writers. The former is the *object* to be accomplished; the latter is the *agency* through which it is accomplished. Thus, a farmer has wheat, butter, eggs, poultry, wool, etc., which he wishes to exchange for cloth, sugar, agricultural implements, boots and shoes, and a hundred other articles. He can not go to the several producers of these, carrying his own products to exchange for them, except at immense disadvantage. Hence arises the necessity for the trader, or merchant. Trade and commerce have sometimes been represented as mutually antagonistic. This is true only to a certain extent. The great economical point to be guarded is to have no more traders than are necessary to make the exchanges. When the industrial and commercial conditions of a country are such that the producers and consumers, who are the real exchangers, are placed and kept at a great distance from each other, so that they can not combine with each other except through the agency of a great number of middle-men, the conditions are highly detrimental to the interests of the parties chiefly concerned. Beyond a certain point, the greater the power of trade, the worse it is for commerce. It is nevertheless true that there are certain natural obstacles to direct commerce which can be surmounted only by some kind of intermediate agency; and this makes the trader necessary. In this respect, and to this extent, trade is an aid to commerce. Yet commerce should be as direct as possible. To this end it is desirable that the greatest number of commodities for which productive facilities exist, should be produced in the same community.

4. The general law of exchange is *value for value*. This will be obvious if we recur to one of our statements concerning the nature of value, namely, that is the quantity of one commodity that may be equitably exchanged for a given quantity of another. It will be still more obvious if we recall the complete definition: value is our estimate of the sacrifice requisite to secure possession of a desired object. Thus, if it require the labor of one day to produce a pair of shoes, and the labor also of a day to produce three bushels of oats, then the rule of exchange would be three bushels of oats for a pair of shoes; because the required labor in the one case is precisely equal to that in the other.

This is the fundamental law, but it is modified in its operation by certain other facts and principles. Chief among these is the law of *supply and demand*. By supply is meant the quantity of any commodity which is in the market. Demand signifies the quantity which is desired at a given price. The definitions are sometimes erroneously given of supply as the quantity which exists, and demand as the quantity desired. But a man may offer for sale a load of wheat, provided the price is a dollar a bushel, but withdraw it from the market if the price is but ninety cents. A thousand people in a certain town may desire diamond necklaces, but not half a dozen may be able to purchase them. Hence supply is all that is offered in the market; and demand is desire with ability to purchase.

Demand and supply affect prices in this way. Suppose a community has been exclusively using wood for fuel, and their wood can be had at a certain price. After a time a coal mine is discovered in the vicinity, and coal can be furnished much cheaper than wood. This would lessen the demand for wood. As there would be the same amount for sale as before, the seller would be in competition, and the price would fall. So if for any reason before the discovery of the coal the supply of wood had been diminished one half, the demand being the same, the price would rise. Thus we have the general principle that other things being equal, the greater the supply, the less the price; the smaller the supply, the greater the price; the greater the demand, the greater the price; and the smaller the demand, the less the price. In other words, the price varies directly as the demand, and inversely as the supply. In general price varies as the cost of production plus or minus the effect of supply and demand. These principles are affected again in many ways which we can not here explain. Yet the variations are always temporary, and the price or market value always tends to seek the level of cost of production.

5. Trade has been spoken of as an agent of exchange. An *instrument* also is needed. The primitive method of exchange was by barter. That is, by giving the commodity one produces for that which one desires to possess. But this was early found inconvenient. The man who made shoes and wished to exchange some of them for a coat, would not readily find a coat-maker in want of shoes; or if he should, the latter very likely would not want just so many pairs of shoes as would be equal in value to the coat. All other exchanges might be at a similar disadvantage. What is needed is a commodity which will be a *medium* of exchange—which every one will be willing to receive for any commodity which he has for sale, and which will command anything which he wishes to buy. Such a commodity is usually the main element in the machinery of exchange, and is what constitutes *money*.

This instrument in order to meet the want, it is generally believed, must have the following characteristics: 1. Value in the material of which it is made. 2. Uniformity of value throughout the world. 3. Much value in small bulk. 4. Approximate constancy of value. 5. Not readily destructible. 6. Divisibility into small portions which are capable of being reunited. 7. Of universal use. 8. Capable of receiving stamps and marks. Most of these properties are found in gold and silver, if not to such an extent as has been claimed for them, at least

so far that they have been the basis of the money of the civilized world.

6. But supplementing in a certain way, and representing these, the instrument of exchange comprises also the large element of *credit*. This consists chiefly of book accounts, promissory notes, bank notes, government notes, bank deposits, checks, drafts, bills of exchange, stocks and bonds. One of the great agencies in modern commerce by which credit is made effectual as a part of the mechanism of exchange is that of *banks*. Banks are institutions which serve to abbreviate and facilitate the business of exchange and to extend and render available the credit of the community.

There are four kinds of banks, namely: savings banks, banks of deposit, banks of circulation and issue, and banks of discount. In our modern banking system the last three are generally found in combination, that is, each bank exercises all the functions implied.

A savings bank is an institution in which small sums of money are deposited from time to time as they accumulate in the hands of persons of moderate incomes. The depositors are credited with these amounts, and receive a certain, usually not very large, rate of interest in any case, and an additional amount contingently. The bank loans the money thus deposited in large sums to trustworthy persons who can furnish good security, the rate of interest being somewhat higher than that paid to the depositor.

The benefit of such an institution is two fold. In the first place there are many persons who have small sums of money which they desire to be earning something in some safe place. The amount is too small to be loaned to advantage. Such persons are not likely to know how, even if the sums at their disposal were sufficient, to find the best investment, or to determine concerning the security offered. But put into the hands of men who make this their business, under rules devised by the best financial talent of the community, and who can combine these small sums and invest them to the best advantage, it is made both safe and profitable for the small capitalists.

In the second place there are many persons who wish to unite their labor and skill with capital in some productive enterprise, and having no capital of their own, desire to borrow. They do not know the persons who have money to loan. The savings bank affords them an opportunity and gives them an advantage which they would not otherwise have. It is a benefit first to those who have some surplus, but are unable to loan it to advantage; secondly to those who are in want of capital, but do not know where to find it.

A *bank of deposit* grows out of the necessities of commerce in a community where much business is transacted. All persons engaged in trade will find from time to time large or smaller accumulations of money in their hands which it is not safe without considerable expense, to keep by them. Hence the custom of depositing these for safe keeping in the bank. Usually no interest is paid as the money may be withdrawn any time at the will of the depositor. It was early found that only a small proportion of these deposits were likely to be withdrawn at any one time; hence a considerable proportion of them could be loaned on short time, and thus the bank would in this way receive compensation for its care, without expense to the depositors. In this way, too, the capital of the community could be kept more fully employed.

But the credit factor in the deposit system soon came to have a much wider scope than is here indicated. Instead of each depositor going to the bank and drawing his money as he needs it, he now gives an order or *check* on the bank to any man to whom he may have occasion to make a payment. In many cases the receiver of such a check also has deposits at the same bank. In such a case he sends in the check to be deposited with his cash for the day. The amount is debited to the drawer of the check, and credited to the depositor of it, and thus by a simple *transfer of credit* much business is done without the in-

tervention of any money. This expands into a great and complicated system of exchange between individuals doing business at different banks, by banks in different cities, and by traders in remote nations. Goods are sold in one locality and paid for in the goods of another locality by means of drafts, bills of exchange, etc., meeting and canceling one another, so that very little money is transferred from point to point.

The function of *discount and loan*, as has been intimated, is in modern banking usually combined with that of *deposit*, as also that of *circulation or issue*. When the capital of a bank is paid in by the stockholders, and the officers elected, it is then ready for business under regulations imposed by its charter. There are two ways in which the public is accommodated. First, when a wholesale city merchant sells a bill of goods to a country retail merchant, it is frequently the case that the former makes out his bill, which the latter accepts, promising to pay in thirty, sixty or ninety days. This accepted bill the wholesale merchant carries to his bank, where it is received with his endorsement, and the cash, less the interest for the given time, is paid him or placed to his credit. This is *discounting* a bill. A loan is sometimes made by a borrower's giving his own note endorsed by some reliable person, and payable in some brief time as above. Sometimes the note is discounted; at other times the interest is paid when the note is taken up.

The function of *circulation* is exercised by the issuing of bank-notes to be circulated as money. When a bank is instituted the stockholders are required to pay in their respective shares in metallic or lawful money. But as the borrower would find coin most inconvenient to carry about, the device arose of substituting notes of the bank, payable on demand, thus leaving the specie in the bank. It was further soon observed that only a very small proportion of these notes were likely to be called for at any one time. Hence a large part of the specie could be used for other purposes instead of being kept idle in the vaults. Under the national bank system now in operation the capital of the bank may be largely invested in United States bonds which are retained in the government treasury, but on which the bank draws the usual interest. The bills of the bank are then guaranteed by the government, so that there is never any loss to the holder of the bills, even if the bank fails.

PROTECTION AND FREE TRADE.

7. We have space but for a very brief outline of this important question. It is one which has for a long time agitated the public mind, and one on which honest and highly intelligent men widely differ. A *protective tariff* so called, is a system of duties levied by the government of a country on certain commodities produced in other countries to prevent their coming into unequal competition with similar commodities of domestic production in such a way as to cripple or destroy the industries implied in the latter.

Free trade is opposed to all those duties, the design of which is to afford any advantage to domestic industry. It implies the same freedom between producers in different nations as between those in the same community.

The main arguments in favor of protection are as follows:

(1) It is the only sure defense of new and feeble industries against the unequal competition of those long established in other or older communities. Freedom of competition is admitted as desirable, but it is denied that this exists under the conditions referred to. A community which has long experience, skilled labor, and accumulated capital, possesses great advantages in the contest with a nation destitute of them.

(2) It is urged that a restrictive system gives a steady and uniform market at an expense less than the benefit accruing.

(3) It is also supposed to be essential to societal completeness; that is, to such a diversification of industry as will most profitably meet the diversity of ability and aptitude in the community.

(4) It is thought to be necessary to the highest prosperity of the unprotected interests. Among these agriculture is the most

prominent. It is for its advantage that the tax of transportation be saved by having manufacturing communities in the midst of agricultural areas. Also, a community compelled to confine itself to agriculture mainly, must virtually transport its soil, the land constantly diminishing in fertility.

The advocates of free trade, on the other hand, present the following arguments in its favor, and objections against protection :

- (1) Free trade is said to be the method of nature.
- (2) It is objected that protection violates the right of every man to do what he will with his own.
- (3) It is said to be of the nature of a tax on all the other industries for the support of those protected.
- (4) It is objected that the restrictive system causes a diminution of exports from the protected country, on the principle that if the latter does not buy of the former, then the former can not pay for the goods of the latter.
- (5) Another argument is that "infant industries" under protection never come to maturity.
- (6) Finally, the case of the United States is cited as an instance of free trade on a large scale between widely remote sections, with the most satisfactory results.

READINGS IN ART.

III.—MODERN SCULPTURE.

The ten centuries following the second have no sculptural remains of value. The dark ages threw their shadow over art, as over literature and society. No doubt the feeling prevalent in the early Church that the "graven image" might become an idol, hindered the progress of the plastic art quite as much as the general decay that pervaded every form of human undertaking.

In the first half of the thirteenth century lived Nicola Pisano, the founder, one might say, of modern sculpture. Nicola is supposed to have been influenced by his study of the remains of Greek sculpture to be seen at Pisa, his home. Applying the principles of the Greek work to the modern subjects, his sculpture inaugurated the Italian renaissance. Church decoration was the field of labor to which all artists of those centuries betook themselves, and Pisano executed his best work, bas-reliefs, on the façades and pulpits of the churches of Pisa, Siena, and other Italian cities. A marble urn of St. Dominic, now at Bologna, is among his celebrated works. Pisano had many followers, among whom were his son (more famous, however, as an architect), and Andrea Orcagna. The latter belonged to Florence, to whose churches he devoted his genius. His masterpiece in sculpture is the tabernacle of the Virgin in the church of San Michele, at Florence. It is a pyramid-shaped altar in white marble; the profusion of reliefs which cover it represent the life of the Virgin. A little before the time of Orcagna lived Giotto, at one time a leader of artistic activity in Florence. He is known well by his beautiful campanile, or bell-tower, and the bas-reliefs with which it is decorated are his best-known sculptures. The basement story is decorated, and, says a writer, speaking of these ornamentations, "This rich cycle of works represents with perfect clearness, and in simple and truly artistic treatment, the whole progress, from the creation of the first man, through the successful conflict with the forces of nature, up to the climax of a life illumined by learning and art, and secured under the maternal shelter of the Church."

It was in the fifteenth century that sculpture attained its highest standpoint. Foremost among the artists of this "golden age," as it has been called, is Lorenzo Ghiberti, the Florentine. The latter was first brought into prominence in 1401, when leading men of Florence offered a prize for the best design for a bronze folding door to be used in the baptistery of San Giovanni. Each artist was allowed a year to complete the test panel, the subject of the design of which was to be the "Sacrifice of Isaac," and the work was to be a bas-relief. Ghiberti was declared the

victor, even by his most famous rivals, Donatello and Brunelleschi. For twenty-one years he labored at his doors, and at the end of that time was entrusted with another. The latter occupied him nearly as long as the first, and was even superior, Michael Angelo declaring it worthy to be the gate of paradise. While busy at the gate of the baptistery, Ghiberti executed three bronze statues of St. John the Baptist, St. Matthew, and St. Stephen, and a bronze sarcophagus of St. Zenobius. Donatello has been mentioned as a rival of Ghiberti in the contest for the door: he deserves mention as one of the most faithful followers of nature during this period. He even carried his naturalism to excess, copying the deformed, the horrible, and the grotesque. There are, however, several fine statues by him in San Michele. Among these are the statues of St. Peter and St. Mark, in niches on the outside, and a fine statue of St. George. The first equestrian statue of modern art was by Donatello, and is at Padua.

Lucca del Robbia lived at the same time, and his name is associated with the beautiful terra-cottas found in such quantities in the churches of Florence. These works are in white, on a pale-blue ground, and were glazed by a process now unknown. The subjects used on them were almost invariably the Madonna and Child. But Robbia did much in marble and bronze. In the Uffizi is to be seen a frieze for the front of an organ, by him. "It represents boys and girls of different ages, dancing, singing, and playing on various musical instruments, and is full of charming simplicity and childlike grace, and rich and varied in action. Some of the figures are almost wholly detached from the background, particularly in the representation of the dance." There are many more names which might be added to this Tuscan or Florentine school of sculpture. Andrea Verocchio is the only one we will mention, and his strongest influence was exerted as the teacher of that master-artist of the sixteenth century, Leonardo da Vinci.

The works of the fifteenth century are very numerous; they crowd the churches of Rome, Florence, and the neighboring cities. Not only in Tuscany, but in Upper and Lower Italy these artists were employed, and many native artists, imitators of the school, have left sculptures on the tombs and in the churches of Venice, Naples, and Como. The subjects of artistic effort, it will be noticed, are nearly always religious. Lübke says of this period: "It was chiefly devoted to the ornamentation of tomb-monuments and altars, which, with few exceptions, were built up against the wall in the shape of a triumphal arch, and required much plastic decoration in the way of reliefs and detached figures. Pulpits, fountains, holy-water basins, singing-galleries, and choir-screens were also adorned with rich carvings. This abundant supply of work necessarily called forth a corresponding amount of skill, and the nature of the subject helped the artistic and realistic taste of the time to express itself. There was a decided effort to attain a correct likeness in portrait-statues of the dead, and in the numerous reliefs there was a tendency to portray the varied scenes of life."

But a new form of plastic art was to appear in the coming century. To quote from the same author: "Italian plastic art had during the fifteenth century gained a new form from the study of the antique, and had made considerable advances in the unceasing effort after truth and life. . . . But hitherto, the expression of an often severe and tasteless realism was predominant, and now, under the influence of a profound and repeated study of the antique, an inspiration toward the ideal, the beautiful, and the sublime, was to assert itself; and this gave rise to a higher and freer style. . . . Plastic art gained a freer and nobler comprehension, a broad, bold treatment of forms, and a style simplified so as to bring out what was fundamental and essential, which might, for a moment, compete with the antique." Leonardo da Vinci was one of the first in the list of masters of the fifteenth century, but, unfortunately, we have lost his best work. Andrea Contucci, better known as Sansorino, executed many sculptures which are unparalled in beauty of treatment and form. In the baptistery at Florence is one of the noblest of these

—the baptism of Christ. The figures of John the Baptist and Christ are life-like, free, and perfectly developed. There is nothing more interesting among what Sansovino has left than the decorations of the Holy House of Loreto. "Taken as a whole, this work is probably the most important collective creation in the sculpture of this golden age." There are a great number of reliefs employed in the ornamentation, and the niches are filled by single statues; of the former the Annunciation and the Nativity are the most important.

But by far the ablest of the sculptors was Michael Angelo Buonarroti, of Florence. It was as a sculptor that he chose to regard himself, although, as in the case of so many of the Italian artists, he was both a painter and architect beside. Numerous works attributed to him are in existence. Mythological subjects, as well as religious, are to be seen among them. Thus there are bas-reliefs at Florence representing Hercules in his contest with the centaurs, and a statue of Bacchus in the Uffizi. The colossal marble statue of David in the academy at Florence, is said to have been carved out of a rejected block. The most ambitious undertaking of Michael Angelo was the mausoleum of Pope Julius II. The designs were drawn on a grand scale, and the master had gone to Carrara to get out the marble, when a misunderstanding between him and the Pope stopped the work. It was afterward re-attempted, but never finished. Some of the detached figures intended for the tomb are still seen. Among them the famous Moses, in the church of San Pietro, at Vincolo. Two groups at Florence were executed for the sarcophagi of Giuliano and Lorenzo de Medici. The statues of the princes are seated in niches in the wall: at their feet, on the lids of the coffins, are the groups: on that of the former the design is Day and Night; on the latter Dawn and Evening. We can mention no more of his designs, but will add the fine criticism of a German critic: "If we compare Michael Angelo with those who went before, we see at once that art reached one of those turning-points at which it enters on a new period with an undreamed-of future opening before. His deeply emotional soul was content neither with the contemplative realism of the fifteenth century, which was based on its truth to nature, nor with the quiet, harmonious beauty of contemporaneous masters. Each of his works exists for its own sake only, and here we see a kinship with the antique. But again: each of them is also the product of the stormy inward struggles of a man who is ever aiming at the highest ideal, and untiringly striving after a new expression of his thoughts—a man to whom achievement gave but little satisfaction, so that often he left his works unfinished. Here we see the strongest contrast to antique art. Nearly all his sculptured works are in one sense or another incomplete, and many he had to drop, because under the mighty stress of his ideas, and in his eagerness to liberate from the marble the slumbering soul within, he had made a false stroke and spoiled the block."

The influence of Michael Angelo was predominant. The productions of almost every sculptor of the times were marked by both his strong and weak points. The Michelangesque manner, as it has been called, was evident in the sculptures of the following century.

Outside of this Tuscan school there were during the sixteenth century several prominent artists; at Modena, Antonio Begarelli, who worked mainly in terra-cotta, and who left many works in the churches of his native city.

At Padua lived Riccio, who executed a bronze candelabrum which has become famous for both its size and its excessive ornamentation. It was eleven feet in height and laden with innumerable fantastic reliefs and figures mostly taken from mythology. A pupil of Sansovino, Jacopo Tatti, was the leader in Upper Italy. He worked mainly at Venice. The bronze of the sacristy of St. Mark in that city, the choir-screen in the same church, and several figures of evangelists in bronze are among his religious works. In the Doge's palace are two large statues of Mars and Neptune which are particularly fine. He

also did portrait-sculptures of much merit. But during this century art was by no means confined to Italy, though Italy then, as always, took the lead. In the North there was a steady work in the plastic art. The influence of the antique was wanting, and the materials in which the works were executed were different. Wood carving was very popular; invariably much gilding and brilliant coloring was used. The work was mainly on the altars of the churches, on shrines, figures for niches in the church walls and choir stalls. Michael Pacher, of Austria, was eminent in this art; Veit Stoss, of Cracow, and Jörg Syrlin, of Ulm. In nearly all of the old churches of Germany are these highly colored carvings in wood.

But stone was used as extensively, and in a somewhat wider variety of works. Many monuments, the buttresses of churches, lecterns, doors, and choir-piers, were made in stone and decorated in the usual manner by reliefs and figures. Nearly all the German cities boast more or less of stone work in their churches.

The leading artist of the time was Adam Krafft, who worked mainly in Nuremberg. A very fine and powerful work by him is the Seven Stations, as it is called. It represents the repeated fainting of Christ beneath the burden of the cross. The work is done in relief. The face and expression of the Savior is noble and expressive in every case. This work was followed by Christ on the Cross. In 1492 he executed the history of the Passion for a monument on the exterior of St. Sebald's church.

The monuments of the time are mainly very superior. Among them may be mentioned that of Emperor Henry II. and his consort by Riemenschneider, the marble monument of Bishop Rudolph von Schrenburg in the Würzburg cathedral, and the marble memorial to the Emperor Frederic III. in Vienna. The celebrated school of metal works of Nuremberg flourished during this period. The best known representatives belonged to the family of Vischer, and in Peter Vischer the most complete artistic development was reached. The earliest work, by Hermann Vischer in 1457, was the bronze baptismal font in Wittenberg. Peter, his son, began his work on the tomb of Archbishop Ernst in Magdeburg cathedral, but his *chef d'œuvre* was the tomb of St. Sebald in the church of that saint at Nuremberg. Vischer and his five sons were engaged on this for eleven years. The sarcophagus rests on a base elaborately wrought in relief, and the whole is enclosed; the cover is composed of three arched canopies supported on eight slender columns. The base, pillars and canopies are wrought exquisitely; although the ornaments are profuse, yet a perfect simplicity and purity of style is preserved. There are very many other productions attributed to Vischer—a fine relief in the cathedral at Regensburg, several tombs, and, as examples of his treatment of antique designs, an Apollo at Nuremberg, and a relieve of Orpheus and Eurydice in the Berlin Museum.

One of the most magnificent tombs of this period was that of the Emperor Maximilian at Innsbrück; several of its figures were from Peter Vischer's hands. Twenty-eight colossal bronze statues of the ancestors of the imperial house and of heroes surrounded the monument. Besides these there were a large number of gracefully poised female figures, and twenty-three figures of the patron saint of the House of Austria. The whole was surmounted by a marble cenotaph on which a figure of the Emperor knelt. Several artists were engaged on this monument. The sculptures of this period in other countries are not very prominent. In France there was considerable attention given to plastic art. Many fine choir-screens have been preserved, and some exceedingly rich tombs. Among the latter are the monuments of Louis XII. and his wife (1530), of Francis I. (1552), and of Henry II. (1583), all in the church of St. Denis in Paris. A set of artists who were engaged on the decorations of the palace of Fontainebleau was known as "the Fontainebleau school." The leader of this group was Jean Goujon. The sculpture of Spain during this period followed largely the Italian schools. The most lavish treatment is visi-

ble in the decorations of the churches, particularly in the altars. The high altar of the cathedral at Toledo is one of the most costly and ornate of its time (about 1500).

"The seventeenth and eighteenth centuries were marked by a decadence of sculpture. Plastic art sought to become striking, rejected everything that could limit her art and gave herself up freely to her longing after what was striking. Henceforth it was decreed that every plastic work must be spirited. The most striking effects must be aimed at in the expression of inward emotion through mien, attitude and position. . . . Besides the drapery must be arranged in all sorts of ways conducive to effect. . . . Thus all dignity, simplicity and distinctness in sculpture, all plastic style was lost, and was succeeded by a senseless striving after outward effect and mere decoration." The best Italian artists of these years were Lorenzo Bernini (1598-1680), who showed well the perversion of the principles of art, and Alessandro Algardi. The French claimed as their most celebrated masters in the seventeenth century, Pierre Puget, who worked chiefly at Genoa, and François Girardon, both of whom are noted for their exaggerations; in the eighteenth century were Houdon and Pigalle.

Franz Duquesnoy, the Fleming, worked at Rome in the seventeenth century and gained a fine reputation by his life-like figures of children. In Berlin, Andrew Schlüter executed superior works. Among these are the masks of dying warriors carved above the windows of the court of the Arsenal. An equestrian statue of the Great Elector is his best work.

In the latter half of the eighteenth century a revival of sculpture took place; this has been attributed to the efforts of Popes Clement XIV. and Pius VI., to the publications of Winckelmann, and to the unearthing of the treasures of Pompeii and Herculaneum. The first sculptor to initiate works of purer taste was Canova (1757-1822); he came of a race of stone cutters, and while at work at his trade executed the figures which attracted the attention of a Venetian, who educated him for an artist. Canova's early works were mythological in subject. He had studied sculptures unearthed at Pompeii and Herculaneum, and under their influence executed his "Apollo crowning himself with laurel" and "Theseus vanquishing the Minotaur." In 1802 Canova was invited by Napoleon to Paris where he executed a colossal statue of the emperor. His figures of women were his most pleasing works. Of the many monuments he executed, the best is that of Christina in the church of the Augustines at Vienna. But few artists escaped the influence of Canova. Among his best known followers were Dannecker, of Stuttgart; Chaudet, a French artist, and Flaxman, an English sculptor.

For a brief outline of the sculptor of the nineteenth century we can do nothing better than quote from Lübke:

The Danish artist, Bertel Thorwaldsen (1770-1844), penetrated farther than all these masters into the spirit and the beauty of classical art; and created, with inexhaustible fertility of imagination, and with the noblest feeling for form, an array of works which are conceived with a pure, chaste, and noble appreciation of the Greek spirit. In his celebrated frieze of the triumph of Alexander in the Villa Carlotta, on the lake of Como, the genuine Grecian relief style is revived in all its perfect purity and severity. He also treats with the versatility of genius and with charming simplicity the subjects of ancient mythology, in numerous statues, groups, and smaller reliefs; and even introduces into the domain of Christian representation a novel, beautiful, and dignified treatment, in the sculptures executed by him for the Church of Our Lady in Copenhagen. Among his monumental works we may mention the statues of Gutenberg at Mayence, and of Schiller at Stuttgart, the Dying Lion at Lucerne, the equestrian statue of the Elector Maximilian at Munich, and the tombs of the Duke of Leuchtenberg in St. Michael's Church at Munich, and of Pope Pius VII. in St. Peter's Church at Rome.

While the wide domain of idealistic sculpture was thus again

cultivated with such versatility of inspiration, the Berlin artist, Johann Gottfried Schadow (1764-1850), adopted a more realistic style, especially directed toward lifelike composition and distinct characterization of individual peculiarities. His monument of the Count von der Mark in the Church of Ste. Dorothy in Berlin, the statue of Frederic the Great at Stettin, and, in a less degree, the Blücher monument at Rostock, and that of Luther at Wittenberg, as well as many others, are vigorous protests against the mannerism of the hitherto prevailing tendency, and re-open to sculpture a field which had now been almost lost to her for two hundred years.

Thus a new path was opened to modern sculpture, in pursuing which it has of late years accomplished great results, and which assures to it still greater beauty, and diversity of attainment, if only it hold fast to the principles already secured, and go on with true dignity toward its goal. Even if the world of ideal forms should never again acquire that importance for us which it possessed for the Greeks, nevertheless the daily life of humanity still contains a wealth of exquisite motives, full of beauty and *naïveté*, which give to the sculptor's fancy ample incitement to ideal creations. There is, moreover, in the chaste grace and pure dignity of the antique conceptions, an imperishable charm, which appeals to every human sentiment, and secures for all productions conceived in a similar spirit the warm interest of those who delight to refresh themselves with the simple beauty that belongs to every true manifestation of nature. Hence the idealistic style of this art of Greece, as it has been recognized by the present and endowed with new activity, becomes forever the most priceless and precious possession of modern sculpture.

The new-born historic feeling of the several nations demands to-day that their heroes, the defenders of their liberties, the representatives of their intellect, their warriors in the battles both of the sword and of thought, shall be preserved to fame in the true likeness of their actual forms. As a consequence, sculpture is compelled to probe the depths of the individual consciousness; to investigate the characteristics of each individual intellect as expressed in the figure, the physiognomy, and even in the externals of attitude and garb; and even to give utterance to the mysterious life of the soul, as far as it lies within her power. Without losing sight of the great importance which the study of the sculptures of the fifteenth century has upon this tendency, the influence of the antique should not be undervalued; since, without the sense of beauty so secured, a realistic degeneracy and exaggeration would be very sure to follow.

Among the German schools of sculpture of to-day, that of Berlin takes the lead. Frederick Tieck of this school adopted the antique style in a series of admirable productions, and especially in the decorative sculpture designed by him for the theater; while the path which Schadow had taken was followed up nobly and rationally during the long and influential labors of Christian Rauch (1777-1857). This artist's important position is due less to his wealth of creative ideas than to his delicate feeling for nature, his fine appreciation of the genuine plastic style, and his incomparable care in execution. His importance, however, does not consist merely in his numerous works, but also in the influence he exercised on his large circle of talented scholars. While he shows a true classical beauty in his ideal works, like his victories and his many admirable reliefs, his statues of Prince Blücher, of Generals Bülow and Scharnhorst, his colossal equestrian statue of Frederic the Great at Berlin, his superb statues of Queen Louise, and of Frederic William III. in the mausoleum at Charlottenburg, his bronze statues of Dürer at Nuremberg, of Kant at Königsberg, of King Max I. at Munich, and many others, prove him a sculptor of the first rank for delicate characterization, and lifelike suggestiveness of composition. Many excellent scholars have gone from his studio into careers of independent importance and masterly ability; and these form, with their vigorous

activity, which is never at a loss for employment in important undertakings, the nucleus of the present school of Berlin.

Among the most conspicuous of the Berlin artists should be reckoned Friedrich Drake, whose reliefs on the statue of Frederick William III. in the Thiergarten at Berlin are full of simple grace. Another of this school is Schievelbein (died in 1867), who showed a great deal of imagination, especially in the composition of reliefs; as in the great frieze representing the destruction of Pompeii, in the new museum, and also in the relief on the bridge at Dirschau.

Ernst Rietschel (1804-61) claims indisputably one of the first places among the sculptors of his century, as regards versatility of endowment, delicate feeling for form, and depth of sentiment. He derived from Rauch his faithful and characteristic representation of life, and his painstaking execution. His double monument of Schiller and Goethe at Weimar, his monument of Lessing in Brunswick (in a still purer and happier style), and the statue of Luther executed for a monument at Worms, are good examples of these traits. In the group of the Virgin with the body of Christ, which he executed for the Friedenskirche near Potsdam, he produced a work full of striking expression, and of the deepest religious feeling; while the subjects of his numerous representations in relief for the pediment of the opera house at Berlin, and the theater and museum at Dresden, represent him with equal dignity and merit in the department of the ideal antique subjects. Ernst Hähnel is a Dresden artist, whose powerful compositions for the Dresden theater and museum are antique in treatment, but who also produced monumental statues, works of the most delicate characterization, such as the Beethoven at Bonn, the Emperor Charles IV. at Prague, and the statues designed for the Dresden Museum, especially the noble Raphael. Recently, also, Schilling has distinguished himself by his ideal groups of the divisions of the day,—Morning, Noon, Evening, Night,—designed for the Brühl Terrace.

In Munich, the talented Ludwig Schwanthaler (1802-48) was the chief representative of a more romantic style, which opened a new field of fresh ideas to modern sculpture. This master, who was endowed with an almost inexhaustible imagination, carried out a great number of extensive works during his short life, in supplying the plastic decorations for most of the buildings erected by King Louis. While these are distinguished by fertility of invention, and an excellent decorative taste, the artist, spurred on to ceaseless labor, and hindered by bodily infirmities, did not succeed in giving his monumental creations that thorough development of form which is an essential of sculpture. It can not be denied, however, that a grand monumental conception is visible in these productions, as is especially proved in the colossal statue of Bavaria in Munich. A numerous school had its origin in this artist's studio.

In France, sculpture early endeavored to free herself from the rigid rule of the antique, and carried the prevailing effort after dramatic effect, expression and passion, even to an extreme point of realism. Individual artists have kept to a noble and more moderate style; as Bosio, and the admirable sculptors Rude and Duret; but, on the other hand, P. J. David d'Angers (1793-1856) devoted himself, in utter violation of all the severer laws of sculpture, to a violent realism, which, although it is sustained by great talent and a charming facility in composition, deteriorates into a lawless exaggeration in his monumental works. His numerous portrait-busts, on the other hand, are extremely lifelike, and full of genius. The Genoese artist, James Pradier, takes the first rank among those sculptors who especially delight in the representation of sensuous beauty (1792-1852). The talented artist, Barye, who died in 1875, is chief among the sculptors of animals. The sculpture of Belgium follows the same general direction as the French.

Rome forms an important central point in the production of modern sculpture, with her numerous studios, her skill in marble-cutting,—an art handed down to her from ancient

times,—and her vast collection of antique works. Here Canova and Thorwaldsen had their studios, which were for many decades the most famous nurseries of modern sculpture. That the antique conception and the idealistic style should acquire especial prominence here lay in the nature of things. Only where the modern social and political life exercises its full powers does sculpture find tasks that call upon her for the characteristic representation of important personages, and the lifelike delineation of historical events.

The English artist, John Gibson, is conspicuous among the sculptors of different nationalities who have made Rome their headquarters, as the representative of a noble classic style. The tendency of the numerous sculptors whom England has recently produced is toward the genre-style, and toward graceful forms in the manner of Canova. Macdonell, an artist of much taste, and Sir Richard Westmacott, also well known by his public works, deserve mention here, as well as R. J. Wyatt, by whom we have some charming representations of subjects chosen from the ancient myths. The United States of America should also be included in this enumeration: for they possess sculptors of decided talent in Randolph Rogers (who designed the bronze gates of the Washington Capitol), Miss Hosmer, and E. D. Palmer, who, though a gifted artist, inclines to an exaggeration of the picturesque. Among the German sculptors in Rome, Martin Wagner, who died in 1860, is worthy of note for his energy of style; and, among those still living, Carl Steinhäuser, now in Carlsruhe, is remarkable for an elevated feeling for form, and depth of sentiment; while J. Kopf shows much delicate grace; and the more recent artist, Ad. Hildebrand, has a rare feeling for nature. Finally, Holland has an excellent sculptor of the idealistic school in Matthias Kessels (1784-1830), who studied under Thorwaldsen.

SELECTIONS FROM AMERICAN LITERATURE.

DR. HORACE BUSHNELL.

Dr. Bushnell's mind was one of the rarest. What it was in his books, that it was in private, with certain very piquant and unforgettable flavors added.—*Dr. Burton.*

I think he had no capacity, with all his eminent powers, for enmity. Goodness and wisdom were the powers that amounted to genius in him by being so great.—*Rev. C. A. Bartol.*

WRONG RESISTED.—As it is said that ferocious animals are disarmed by the eye of man, and will dare no violence if he but steadily look at them, so it is when right looks upon wrong. Resist the devil, and he will flee from you; offer him a bold front, and he runs away. He goes, it may be, uttering threats of rage; but yet he goes.

GREAT MEN.—The great and successful men of history, are, commonly, made such by the great occasions they fill. They are the men who had faith to meet such occasions; and therefore the occasions marked them, called them to come and be what the successes of their faith would make them. The boy is but a shepherd, but he hears from his panic-stricken countrymen of the giant champion of their enemies. A fire seizes him, and he goes down to the army, with nothing but his sling, and his heart of faith, to lay that champion in the dust. Next he is a great military leader, then the king of his country. As with David, so with Nehemiah; as with him, so with Paul, and Luther. A Socrates, a Tully, a Cromwell, a Washington—all the great master-spirits—the founders and law-givers of empires, and defenders of the rights of men, are made by the same law. These did not shrink despairingly within the compass of their poor abilities, but in their heart of faith embraced each one his cause, and went forth under the inspiring force of their call to apprehend that for which they were apprehended.

FAMILY RELIGION—WHY A FAILURE.—The father prays, in the morning, that his children may grow up in the Lord, and

calls it the principal good of their life, that they are to be Christians, living to God and for the world to come. Then he goes out into the field, or shop, or house of trade, and, delving there all day in his gains, keeps praying from morning to night, without knowing it, that his family may be rich. His plans and works, faithfully seconded by an affectionate wife, pull exactly contrary to the pull of his prayers, and to all their common teaching in religion. Their tempers are worldly, and make a worldly atmosphere in the home. Pride, the ambition of show, and social standing, envy to what is above, and jealousy of what is below, follies of dress and fashion, and the more foolish elation, when a son is praised, or a daughter admired in the matter of personal appearance, or, what is no better, a manifest preparing and foretasting of this folly, when the son or daughter is so young as to be more certainly poisoned by the infection of it. Oh, these unspoken, damning prayers! how many they are, and how they fill up all the days! The mornings open with a reverent, fervent-sounding prayer of words; and then the days come after piling up petitions of ends, aims, tempers, passions and works, that ask for anything and everything but what accords with genuine religion. The prayer of the morning is that the son, the daughter—all the sons and daughters—may be Christians; and then the prayers that follow are for anything but that—in fact, for things most contrary to that. Is it any wonder, when we consider this common disagreement between the prayers of the family, and all other concerns, ends, and enjoyments of the common life beside, that so many fine shows of family piety are yet followed by so much of godless, and even reprobate, character in the children?

DR. NOAH PORTER.

How to Read History.

Whately pertinently observes, in his annotations upon Lord Bacon's "Essay on Studies:" "In reference to the study of history I have elsewhere remarked upon the importance, among the intellectual qualifications for such a study, of a vivid imagination. The practical importance of such an exercise of imagination to a full and clear, and consequently, profitable view of the transactions related in history can hardly be overestimated."

To stimulate and aid the imagination in its efforts to reproduce the past, historical plays and poems, and, more recently, historical novels have been abundantly employed. Their usefulness has been the subject of frequent discussion, and of various opinions. It has been forcibly, and perhaps not untruly said, that the majority of the present generation of English readers have learned more of English history from Shakspeare and Walter Scott than from the entire library of professed historians. Of course no man would contend that either Shakspeare or Scott could be substituted for the usual historical authorities, but only that they may supplement them in certain important particulars. Many other historical plays and novels are invaluable as enabling the reader to enter more fully into the spirit of past times. They are of especial service in helping him to appreciate the feelings and motives of prominent personages, and vividly to reproduce the manners and institutions of another age. It is not often that an historical writer is endowed with the painstaking zeal of the antiquarian, and the creative power of the poet. If we can not have the two gifts in a single writer, we must seek for them apart in the historian and the novelist.

Thackeray's "Henry Esmond" is an admirable example of a good historical novel, when carefully and conscientiously written by a man of rare gifts and of a rarer honesty. No reader of this tale of the times of Queen Anne could fail to derive from it such impressions of the state of manners and of morals in the higher circles, as well as of the political jealousies and the religious feuds which divided men of all classes, as no formal history could possibly convey—such as even the

most abundant and painstaking research into the less accessible resources of historical knowledge would fail to impart to a man of feeble capacity to picture and recombine. The service is not a slight one which is rendered to the world when such a painstaking explorer of historical truth as Thackeray gathers his materials with faithful and laborious research, and weaves them together into so fascinating and instructive a story. But this tale, marvelous as it is for its elaborated truthfulness and picturesque effects, strikingly illustrates the possible dangers and disadvantages to which the historical novel may be abused. Thackeray was not without his prejudices. These, with his desire for producing striking effects, are manifest in the occasional *overdrawing* of this generally well-balanced representation of one of the most interesting periods of English history. It is notorious that Walter Scott gave very serious offense to multitudes of his admiring readers by some of his portraiture of the representative characters of the great historical parties of Scotland and England. With all the good sense and candor which he had at command, his sympathies were too intense and his prejudices too tenacious to allow him to write otherwise than he did, though he knew he should excite the indignation of thousands of his fervid countrymen. Mrs. H. B. Stowe says in the preface to her recent historical romance, "Oldtown Folks:" "I have tried to make my mind as still as a looking-glass or a mountain lake, and thus to give you merely the images reflected therein." But a fervid and sympathetic nature like hers can no more free itself from a theological or personal bias in representing the New England of the past, over which she has laughed, and wept, and speculated, and struggled all her life, than the "mountain lake" can hold itself in glassy smoothness against the gusts and breezes that sweep upon it from the heights above.

The fact deserves notice that of late professed historians have indulged somewhat freely in romancing, and so in a sense turned their histories into quasi-historical novels, especially when they attempt to give elaborate and eloquent portraiture of the leading personages, in which the most lavish use is made of effective epithets and pointed antitheses. Macaulay, among recent historians, has set the fashion very decidedly in this direction. In his efforts to make history minute, vivid, and effective, he has often described like an impassioned advocate, and painted, like a retained attorney, with the most unsparing expenditure of contrasts and epithets. Carlyle gives sketches, alternately in chalk and charcoal, that exhibit his saints and demons, now in ghastliest white, and then in the most appalling blackness. But though he draws caricatures he draws them with the hand of an artist. Froude, by research, eloquence and audacity combined, attempts to reverse the settled historic judgments of all mankind in respect to characters that had been "damned to everlasting fame." Bancroft and Motley abound in examples of this tendency to paint historical characters so much to the life that the impression is made that the result is only a painting to which there never was reality.

WASHINGTON IRVING.

To a true poet-heart add the fun of Dick Steele—
Throw in all of Addison, *minus* the chill,
With the whole of that partnership's stock and good will,
Mix well, and while stirring him o'er as a spell,
The fine old English gentleman, simmer it well,
Sweeten just to your own private liking, then strain,
That only the finest and clearest remain;
Let it stand out of doors till a soul it receives,
From the warm, lazy sun loitering down through green leaves.
And you'll find a choice nature, not wholly deserving
A name either English or Yankee—just Irving.—*Lowell*.

. . . Washington Irving, one of the best and pleasantest acquaintances I have made this many a day.—*Sir Walter Scott*.

The style of Mr. Irving is always pleasing.—*Macaulay*

Throughout his polished pages no thought shocks by its extravagance, no word offends by vulgarity or affectation.—*Edinburgh Review*.

A Rainy Sunday in an Inn.

It was a rainy Sunday in the gloomy month of November. I had been detained in the course of a journey by a slight indisposition, from which I was recovering; but I was still feverish, and was obliged to keep within doors all day, in an inn of the small town of Derby. A wet Sunday in a country inn; whoever has had the luck to experience one, can alone judge of my situation. The rain pattered against the casements, the bells tolled for church with a melancholy sound. I went to the windows in quest of something to amuse the eye, but it seemed as if I had been placed completely out of the reach of all amusement. The windows of my bed-room looked out among tiled roofs and stacks of chimneys, while those of my sitting-room commanded a full view of the stable-yard. I know of nothing more calculated to make a man sick of this world than a stable-yard on a rainy day. The place was littered with wet straw that had been kicked about by travelers and stable-boys. In one corner was a stagnant pool of water surrounding an island of muck; there were several half-drowned fowls crowded together under a cart, among which was a miserable crest-fallen cock, drenched out of all life and spirit, his drooping tail matted, as it were, into a single feather, along which the water trickled from his back; near the cart was a half-dozing cow, chewing the cud, and standing patiently to be rained on, with wreaths of vapor rising from her reeking hide; a wall-eyed horse, tired of the loneliness of the stable, was poking his spectral head out of a window, with the rain dripping on it from the eaves; an unhappy cur, chained to a dog-house hard by, uttered something every now and then between a bark and a yelp; a drab of a kitchen wench tramped backward and forward through the yards in pattens, looking as sulky as the weather itself; everything, in short, was comfortless and forlorn, excepting a crew of hard-drinking ducks, assembled like boon companions round a puddle, and making a riotous noise over their liquor.

I sauntered to the window, and stood gazing at the people picking their way to church, with petticoats hoisted mid-leg high, and dripping umbrellas. The bells ceased to toll, and the streets became silent. I then amused myself with watching the daughters of a tradesman opposite, who, being confined to the house for fear of wetting their Sunday finery, played off their charms at the front windows, to fascinate the chance tenants of the inn. They at length were summoned away by a vigilant vinegar-faced mother, and I had nothing further without to amuse me.

The day continued lowering and gloomy; the slovenly, ragged, spongy clouds drifted heavily along; there was no variety even in the rain; it was one dull, continued, monotonous patter, patter, patter, excepting that now and then I was enlivened by the idea of a brisk shower, from the rattling of the drops upon a passing umbrella. It was quite refreshing (if I may be allowed a hackneyed phrase of the day) when in the course of the morning a horn blew, and a stage-coach whirled through the street with outside passengers stuck all over it, cowering under cotton umbrellas, and seethed together, and reeking with the steams of wet box-coats and upper benjamins. The sound brought out from their lurking-places a crew of vagabond boys and vagabond dogs, and the caroty-headed hostler, and that nondescript animal yclept Boots, and all the other vagabond race that infest the purlieus of an inn; but the bustle was transient: the coach again whirled on its way; and boy and dog, and hostler and Boots, all slunk back again to their holes; the street again became silent, and the rain continued to rain on.

The evening gradually wore away. The travelers read the papers two or three times over. Some drew round the fire and told long stories about their horses, about their adventures,

their overturns and breakings-down. They discussed the credits of different merchants and different inns, and the two wags told several choice anecdotes of pretty chambermaids and kind landladies. All this passed as they were quietly taking what they called their nightcaps; that is to say, strong glasses of brandy and water or sugar, or some other mixture of the kind; after which they one after another rang for Boots and the chambermaid, and walked off to bed in old shoes cut down into marvelously uncomfortable slippers. There was only one man left,—a short-legged, long-bodied plethoric fellow, with a very large sandy head. He sat by himself with a glass of port wine negus and a spoon, sipping and stirring, and meditating and sipping, until nothing was left but the spoon. He gradually fell asleep bolt upright in his chair, with the empty glass standing before him; and the candle seemed to fall asleep too, for the wick grew long and black, and cabbaged at the end, and dimmed the little light that remained in the chamber. The gloom that now prevailed was contagious. Around hung the shapeless and almost spectral box-coats of departed travelers, long since buried in deep sleep. I only heard the ticking of the clock, with the deep-drawn breathings of the sleeping toper, and the drippings of the rain—drop, drop, drop—from the eaves of the house.

Irving's Last Interview with Scott.

It was at Sunnyside, on a glorious afternoon in June, 1855, that surrounded by scenery which Irving has best described, he narrated to me (S. Austin Allibone) the following account of his last interview with Scott:

"I was in London when Scott arrived after his attack of paralysis, on his way to the continent in search of health. I received a note from Lockhart, begging me to come and take dinner with Scott and himself the next day. When I entered the room Scott grasped my hand, and looked me steadfastly in the face. 'Time has dealt gently with you, my friend, since we parted,' he exclaimed:—he referred to the difference in himself since we had met. At dinner, I could see that Scott's mind was failing. He was painfully conscious of it himself. He would talk with much animation, and we would listen with the most respectful attention; but there was an effort and an embarrassment in his manner; he knew all was not right. It was very distressing, and we (Irving, Lockhart, and Anne Scott) tried to keep up the conversation between ourselves, that Sir Walter might talk as little as possible. After dinner he took my arm to walk up-stairs, which he did with difficulty. He turned and looked in my face, and said, 'They need not tell a man his mind is not affected when his body is as much impaired as mine.' This was my last interview with Scott. I heard afterward that he was better; but I never saw him again."

Two years later (in 1857), in narrating the same event, Irving told me that as Scott passed up the stairs with him after dinner, he remarked, "Times are sadly changed since we walked up the Eildon hills together."

JAMES KIRKE PAULDING.

There is no better literary manner than the manner of Mr. Paulding. Certainly no American, and possibly no living writer of England has more of those numerous peculiarities which go to the formation of a happy style.—*Edgar A. Poe*.

His works are exclusively and eminently natural, and his descriptions of natural scenery are often eminently beautiful.—*London Athenæum*.

TIME A DESTROYER.—I saw a temple, reared by the hands of man, standing with its high pinnacle in the distant plain. The streams beat about it; the God of nature hurled his thunderbolts against it; yet it stood firm as adamant. Revelry was in the hall; the gay, the young, the beautiful were there. I returned, and lo! the temple was no more. Its high walls lay scattered in ruin; moss and grass grew rankly there; and, at the midnight hour, the owl's long cry added to the solitude.

The young, the gay, who had reveled there, had passed away. I saw a child rejoicing in his youth, the idol of his mother, and the pride of his father. I returned and the child had become old. Trembling with the weight of years, he stood the last of his generation, a stranger amidst all the desolation around him. I saw an old oak standing in all its pride upon the mountain; the birds were caroling in its boughs. I returned and saw the oak was leafless and sapless; the winds were playing at their pastime through the branches. "Who is the destroyer?" said I to my guardian angel. "It is Time," said he. When the morning stars sang together for joy over the new-made world, he commenced his course, and when he has destroyed all that is beautiful on the earth, plucked the sun from his sphere, veiled the moon in blood; yea, when he shall have rolled the heavens and the earth away as a scroll, then shall an angel from the throne of God come forth, and, with one foot upon the land, lift up his hand toward heaven, and swear by heaven's eternal, "time was, but time shall be no more."

[End of Required Reading for December.]

RETURNING.

By MARY HARRISON.

"The spirit shall return to the God who gave it."

White clouds upon heaven's bosom rest,
Begotten of the sunshine's love,
Now nestled like a fondled dove
Upon a woman's loving breast.

Heaven feeds her baby clouds, they grow,
Then leave her for their manhood's life;
And wail and scramble in the strife
Through which all earth-born children go.

They sink and wander in the gloom
Of winding subterranean ways,
And learn the loss of heavenlier days,
By groping through their chosen tomb.

At length, lights gleam along the distant way,
With eager thoughts of childhood, blest,
And hopes of entering into rest,
They leap to airy, sunny day.

Now rivers slave them to the fields
To fill the cattle-troughs with drink,
And dress the rose-boughs on their brink,
And feed the grass the meadow yields.

For friends and good, they look behind,
Then curse the past, and pray to be
Unborn again within the sea,
For birth has been to them unkind.

All scenes have gone! no good has come!
From bank to bank the waters heave
With tides which only mock and grieve,
Despairs of long-lost, hopeless home.

And looking but for lulling sleep,
The last deep solace of the grave,
They leap to meet the leaping wave,
And find their lost home in the deep.

So through his day, blind man has striven,
As vapor-clouds, he came to be,
Drawn from, then wandering to the sea,
Invisible, with God in heaven.

EDUCATION OF THE NEGRO POPULATION.

By ATTICUS G. HAYGOOD, D.D.

FACTS ON THE SURFACE.

The records in the Department of Education, in Washington City, show that in the recent slave States of the Union the total school population was, in 1881, 5,814,261. Of these, 3,973,676 were white; 1,840,585 colored children. Counting both races the total school enrollment for 1881 was 3,034,896; of these 2,232,337 were white, 802,559 colored children. Nearly half the white, and more than half the colored school population was, in 1881, out of school. In some of these States the school term is from three to five months; in the cotton States not more than three. Perhaps five months each year is as long a school term as the conditions and needs of the laboring classes in these States will allow.

In 1881 these States expended upon their public schools \$13,359,784; except perhaps in one state this money was expended without distinction of race. The races have schools of their own; doctrinaires would mix them by force of law; those who are actually doing the work of education in these States know that this can not be done, and that only harm would come of it, if the experiment were attempted. For neither race would do so well if taught together; the colored children do not desire mixed schools, and the white children will not attend them. In such conditions law is helpless, and force is folly; also ruin.

OTHER FACTS.

The official figures give the numbers; parole evidence is necessary to complete the statement of the case. In 1881 there were, as the Department of Education reports, in the Southern States 17,248 common schools for colored children. With exceptions so few that they are inappreciable in these statements, the teachers in these 17,248 common schools were colored—the large majority being women. The majority of these teachers are pitifully incompetent; some of them are well furnished for their work, and are doing it faithfully and successfully. Nearly all of these colored teachers who are of any use have received their preparation in the various schools for higher instruction established by societies and churches in the Northern States. Some of the best work is done in schools established and carried on by individual devotion—I will not say enterprise. Taking them all together there are nearly one hundred and fifty of these schools, called, as fancy or circumstances prompted or allowed, universities, colleges, institutes, seminaries, normal schools, etc., etc. There is hardly an "academy" among them.

OVER-NAMING.

Many will think me wrong in the opinion I now offer; some of the wisest of the teachers in the real work of teaching negroes will agree with me: it is a misfortune that the names given these schools are so out of proportion to their real work and character. None of them, even in catalogues, go beyond the ordinary college course; many of them do not come up to it; in none of them do more than a very small number complete this course. There is not a university, in any proper sense, among them all. It is not in the spirit of censure that I speak of these things, but of deep interest in the great and necessary work, that the good people engaged in these schools are trying, with rare consecration and in the teeth of a thousand discouragements, to accomplish.

The great names for these schools have done harm. They are misleading to begin with, and that is an evil. It is hard enough to get the indifferent or the antagonistic people to understand the subject of the education of the negroes at best; it is harder when new meanings have to be given to old names in order to state acts. I am of the opinion that the names

given to most of these schools have done some harm in the North—whence the money has been drawn to support them. Northern men have sometimes spoken to me on these subjects in language that made it plain that they would have helped more but from a conviction that “schools and not universities are what these poor people need.” *Per contra*, it may well enough be answered, some have given largely to build “universities” that would not give to establish schools. As to the influence on northern sentiment of the *too-great names*, those who know that sentiment better than I do can express themselves more definitely. I know that the big names have done harm in the States where the schools are. At this point let me say, I am only stating what I believe to be facts. Comments, inferences, justifications, do not concern me just now.

First, then, the large names have excited prejudice among the white people who did not know what was back of the names. Most of them, for a long time, did not know what the universities and colleges were really trying to do; the majority do not know at this time.

Some of those who did know something thought the whole business a mere sham; for a long time only a few southern white people really knew that faithful, wise and successful teaching was done in these colleges and universities—most of it not being college or university work at all. The few who really knew what good work was being done could over-look the ambitious names—it being a weakness in the South and West, yielded to by not a few, to give great names to small schools for white youth. The wiser and kinder-hearted ones could condone the offense of over-large names in view of their own example.

The big names did as much as anything else to anger the poor whites against all negro education. People who know human nature will understand this statement without explanation: those who do not know human nature will not understand it anyway.

The worst evil, in the long run, of this big naming of schools for the negroes, fell upon the negroes themselves. It aggravated the tendency—very strong among them—to be satisfied with the name of a thing in the lack of the thing itself, and, what is more, not knowing that they can lack the thing when they have the name. Take, for example, “—— University,” an admirable school well known to me. Its annual enrollment will average three hundred; its catalogue course reaches from the primary studies through an ordinary college curriculum; one in ten attempts this college course; one in fifty may complete it. The whole three hundred tell their friends: “I was educated in —— University.” It gives them importance. They pass as scholars beyond their merits among their own people. In many of them it breeds injurious conceits—of a sort that makes enemies of those who might be friends, and prejudices with the uninformed—who in all countries are the majority—the whole subject of negro education. It is to be feared that only a few colored students know the difference between “—— University” and a real university.

NO SHAM IN THE WORK DONE.

Let me say with emphasis at this point: there is no sham in the work done in these schools. It is genuine, honest, useful work. This is a general statement; there may be, doubtless are, some schools that do not deserve this praise. But the point I wish to make plain to the readers of *THE CHAUTAUQUAN* is this: if there be sham it is not in the work done, but in the name given the place where it is done. I asked one of the veterans: “Why did you call this school a university?” He answered: “We hoped it would grow to it some day.” How could I blame the hopefulness of those who did the naming? So many of our white schools had been named under the same sort of prophetic impulse.

TRAINING SCHOOLS.

It is those schools backed by the churches and benevolent

societies of the North that are doing the most of the work of preparing teachers among the colored people for the colored people. The very best of the more than seventeen thousand colored teachers have learned whatever they know in these schools. Most of the Southern State governments have recognized the necessity of preparing colored teachers, and make annual appropriations to carry on this work. A few States have established schools of their own; generally they make appropriations to some of the best of the schools established by others.

The great and crying need in the work of education among the people is better teachers in their common schools. They can not be prepared in a day or a year; for it takes much money and much time. The training schools are without endowments, and their patrons are unable to pay more than the lowest tuition fees. If these schools—call them universities, colleges, institutes, seminaries—what you will, are to keep going at their present rate, to say nothing of improvement, white people must furnish the money, for the best of reasons; the negroes have not money to do this sort of work. Most of this money will have to come from Northern pockets, if it comes at all. The State of New York is worth more in property returned for taxation than all the Southern States together—leaving out Missouri, counted in the census of 1880 among “Western States.”

THE JOHN F. SLATER FUND

Begins to do its blessed work. This fund is dedicated to the work of “Uplifting the lately emancipated population of the Southern States and their posterity, by conferring on them the blessings of Christian education,” and it seeks to accomplish this result by “the training of teachers among the people requiring to be taught.” This fund works through existing institutions; it does not found new schools; there are already more good and deserving schools than it can help. Many times the sum this fund affords could be wisely used.

There is not space in this article to discuss the question, but my opinion may be stated: It is necessary that the United States government should aid the States to make their public schools more efficient. Whatever may be true of other sections, the Southern States, owing to the facts of their history and to conditions now existing, are not able to do the work that is upon them.

As to the sentiment in these States on the subject of negro education, it may be said in brief: The outcry of small village papers does not always even reflect the sentiment of the people, and there are certain facts that indicate that the work of educating the negroes will go on with less and less hindrance. Three such facts I mention in closing this article: (1) The duty and necessity of educating the negro has been recognized by every representative church in the South. (2) This necessity is recognized in the educational system of every Southern State. (3) No man who believes he has any political or educational “future,” any longer opposes, under his proper name, the education of his negro fellow citizens.

DRESS changes, but we are not to suppose on that account that the make of the body changes also. Politeness or rudeness, knowledge or ignorance, more or less of a certain degree of guilelessness and simplicity, a serious or playful humor; these are but the outer crust of a man, and may all change; but the heart changes not, and the whole of man is in the heart. One age is ignorant, but the fashion of being learned may come; we are all moved by self-interest, but the fashion of being disinterested will never come. Amidst the countless myriads of creatures born in the space of a hundred years, nature may perhaps produce two or three dozen of rational beings whom she must scatter over the world, and you can readily imagine that they are never found any where in such large numbers as to set the fashion of virtue and uprightness. —Fontenelle.

MAN OF LEARNING, TELL ME SOMETHING.

By MARGARET MEREDITH.

I wonder if men could not be persuaded to alter their style of conversation with girls, to talk to us as they talk to men?

We have a feeling that learned young men are the duller of talkers; not because they talk weightily; Oh, no! because they talk so lightly, and lightness is not their forte.

A diligent student, a very cormorant, perhaps, of knowledge, dons a white necktie and sallies forth, and resolutely leaves behind for the evening every material he has wherewith to make himself agreeable. He is not witty, he is too busy to be a gossip, he is too little in company to learn an easy jog of commonplace or compliment. So he sits on a sofa, and the girl makes some opening remark, to which he replies with studied interest; and at the pause she magnetically feels that it is best to make a longer remark this time. If she were talking to a lad, she might drift into expressing some of her real ideas, and find profit and pleasure in airing them; but for the amusement of this young savant, by no means. Still, at his next turn to speak, or the next, she has come suggestively near some subject worth talking of; if he were with a man he would instantly plunge in, and in five minutes they would be deep in discussion or description, sharpening their wits by every sentence, fixing what they have read, shaping their crude opinions, thoroughly enjoying each other; and for this they need not be equals in cultivation, nor altogether equals in mind.

Why should it be so different when talking with a woman? There is no reason, but habit. One says, "People dislike to talk shop; the busy scholar wants a rest." On the contrary, most people, I think, would rather talk shop than anything else. If it is their life interest and their strong point, they have so much more to say. The truth is, they fear that the listener will object, and so "in company" they avoid it. I wager the listener would be delighted.

I do not write so much to those who can get up at will a brilliant flow of mere scintillation. That is a scarce enough article to be valuable. Yet they might use it occasionally on sense as well as on nonsense, and make themselves all the more notably entertaining.

I once knew a grave professional man who was said to be both clever and cultivated, but for me there seemed no possible way to enjoy him. His visits were the most empty occasions. He was "a desirable person to be visited by," but he was unendurable; though he did not fail to be politely attentive in more ways than one. I was glad he was going away. Just then a mutual friend came on the scene, who had views on this matter. I know she gave him the benefit of them, as well as if she had told me; for such an amazing change I never saw. The passive sitter waked up, the bore became a charming talker, and all because he had taken his own permission to be agreeable in his natural way. I was so sorry when he left town!

That instance of transformation is what inspires my appeal. The thing would seem grounded and settled, incapable of cure, but what one exhortation can accomplish has been proved.

And it is a case in which the butterfly may well spring full-colored from the chrysalis, for the stuff that talk is made of is all there; not repartee, of course, or always brilliant expression for one's thoughts and facts; but thoughts and facts very simply used make an evening world-wide different from a succession of laboriously-framed sentences carefully intended to be about something in which the man does not take any interest, and the woman sees he does not. Can we wonder that the sand-man has to be struggled with many a time by both parties? Young boys do not blink with sleep under your very eyes; but full-grown men often do, and largely because they insist on pursuing at thirty-five about the same topics of conversation that they used at eighteen.

Don't you, Mr. Dry-as-dust, want to turn over a new leaf? My opportunities of learning are limited, perhaps, while yours are constant. If I am to spend an hour, or two or three, with you, will not you give me some advantage from your well-furnished store-house? If I do not respond then possibly you may stand excused, and never again run the risk of talking over my head.

But give me one fair trial, and see if we are not "better company" and better friends ever afterward.

HIBERNATION.

By the REV. J. G. WOOD, M.A.

The hedgehog, like the bat, is carnivorous.

Toward the end of autumn it looks out for some retired spot, a perfectly dry cavity in the ground or in the rock being the favorite resort. Here it gathers together a large quantity of dry moss, leaves, grass, etc., covers itself with them, rolls itself into a ball, and sinks into the hibernating lethargy.

It is rather remarkable that a hibernating animal is much more sensitive to a slight touch than to general handling. If, for example, a single hair of a hibernating bat or a single quill of a hibernating hedgehog be raised, the creature gives a quick start, and takes a few breaths before relapsing into lethargy. Yet a bat may be sunk under water, or have a thermometer tube passed into its stomach, without being awakened.

When a hibernating bat is sunk under water of the same temperature as that of its body, it does not even attempt to breathe. A similar experiment was tried with a hedgehog, and after it had been under water for twenty-one minutes, one tiny bubble of air rose to the surface. I need scarcely say that if the animal had been awake, it would have been drowned in less than a fourth of the time.

For the bat, no food can be found until the warm weather returns, and so the hibernation is unbroken for at least five months. But, though food be almost entirely withdrawn from the hedgehog, some nutriment remains, and therefore the animal is so constituted that it can discover and consume the food which has been provided for it.

This food chiefly consists of snails, which are themselves hibernators, and which during the winter months conceal themselves so effectually that they are seldom detected except by their two great wintry foes, the thrush and the hedgehog.

The hedgehog, not possessing so wide a range of hibernating temperature as the bat, which actually "hibernates" daily for a short time even during the hottest summers, is roused by an hour or two of warm sunshine such as we often experience about February. Awakened by the warmth, the hedgehog unrolls itself, creeps out of its refuge, and trundles (I know no better word to describe its peculiar pace) away in search of food. Taught by instinct, it is sure to come upon one of the strongholds of the snail, eats as many as it needs, returns to its home, and sleeps until awakened in a similar manner.

Then we have the vegetable-eating squirrel, which is a partial hibernator.

During the later weeks of autumn, the squirrel may be seen in the act of making provision for the winter. In the first place it collects a vast store of fallen leaves, moss, twigs, and similar materials, and with them constructs its winter nest.

Squirrels have two distinct kinds of nest, one for the winter and the other for the summer. Both nests are of considerable size, and both are so well concealed that to detect them is a very difficult task. The summer nest is comparatively light in texture, and is placed near the ends of lofty boughs, where it is hidden by the leaves. Moreover, its position renders it almost unassailable, as the branch on which it is built would not even endure the weight of a small boy. In the winter, when the leaves are off the trees, the nests are very conspicuous, and in

the New Forest, where I gave some time to watching the habits of the squirrel, they are exceedingly numerous.

In fact, the squirrels of the New Forest swarm in such numbers, and do so much damage to the young twigs of the trees, that many hundreds must be shot annually, just as is the case with rabbits. They are always shot just before hibernating, because, as they put on new robes for the winter, their skins fetch the best prices. Moreover, the animals become fat, as is the case with all hibernators, and so their flesh is in good condition for the table. Squirrel-pie is a well-known luxury in some parts of England, and is far superior to rabbit-pie, as it is free from the peculiar flavor which attaches itself to the rabbit, and to many persons is exceedingly repulsive.

The winter nest is a very large one, containing at least four or five times as much material as would serve for a summer's nest. Instead of being placed at the end of a bough, it is always set in the hollow caused by the junction of several large branches with the trunk. The exterior is so skilfully formed, that when the tree is viewed from below, even the most practised eyes will often fail to detect the nest, large as it is.

The amount of material which a squirrel employs in this nest is really wonderful. I have taken out of a single nest armful after armful of leaves, until quite a large mound was raised at the foot of the tree, and I should think that there was enough material to fill two large wheelbarrows, even if it were pressed down closely.

I may here mention that the nest of the squirrel is known in some parts of England by the name of "drey," and in others by that of "cage." The latter term is employed in the New Forest.

The house being ready, next comes the task of laying up a store of food. This consists chiefly of nuts, which the animal chooses with marvelous sagacity, or rather, instinct. No one ever yet found an unsound or worm-eaten nut in a squirrel's store. The animal does not rely on a single storehouse, but hides its treasures here and there within easy range of its nest. Many nuts it buries, and owing to this habit, nut-trees are apt to spring up in unexpected places, for, if the weather should be exceptionally severe, the squirrel awakens but seldom from its winter sleep, and so does not need the store which it has hidden. Or, it may die or be killed after it has laid up its food, and so the buried nuts will take root and produce trees.

A remarkable instance of this fact occurred in the grounds of Walton Hall, belonging to the late Charles Waterton.

In former days there had been in the estate an old wooden mill. It had been disused for many years, and at last the only relic of it was the upper millstone which was left on the ground. The reader may be aware that the center of the upper stone is pierced with a tolerably large hole, through which the corn makes its way between the stones.

In the autumn of 1813, some nut-eating, hibernating animal, almost certainly a squirrel, had found this stone, and thought that the hole would make an admirable hiding-place for a nut. For some reason, the nut was never eaten, and consequently began to germinate. Mr. Waterton, who pervaded his grounds at all hours of day and night, detected the green shoot at once when it appeared in the spring of the following year. Foreseeing that the shoot, if it lived long enough to become a tree, would raise the stone from the ground, he had a fence put round it, and gave special orders for its preservation.

His prevision proved to be perfectly correct. In course of years, the little shoot became a large tree twenty-five feet in height, and bearing fine crops of fruit annually, and Mr. Edmund Waterton told me that in his boyhood he had often climbed it for the purpose of procuring nuts. After the stem was large enough to fill the orifice in which it had been planted it lifted the stone, and raised it some eight or nine inches above the ground.

As might be imagined, in the course of years the pressure of the stone destroyed the bark, and stopped the circulation of the

sap, so that the tree died. In order to save it from being blown down, the trunk and branches were cut away some feet above the stone. On my last visit to Walton Hall, shortly before Mr. Waterton's death, the stone was still suspended above the ground, and as a memorial of so remarkable a result of hibernation, I made a careful sketch of it, which was published by Messrs. Macmillan.

It is also noticeable as an example of the slow, silent, and almost irresistible power of vegetation. Even the soft and pulpy mushroom has been known to raise a flat, heavy paving-stone fairly off the ground. Had the mushrooms been allowed to grow, and the paving-stone laid on them, it would have crushed them under its weight. But the vital powers of growth are so tremendous, even when acting upon so feeble a medium, that they performed a feat which would have been thought impossible had it not been witnessed.

In some parts of South America, where the growth of vegetation is surprisingly rapid, there used to be, and may be still, a mode of inflicting capital punishment by the power of vegetation. We all know the sharply-pointed and bayonet-like leaves of certain aloes. The victim was simply fastened to the ground over a spot where an aloe was just starting from the earth, and before a day had gone by, the leaves would grow completely through the body.

I briefly mention these examples in order to show how all nature is linked together, and that the hibernation of animals and the growth of vegetables are parts of one great system.

Owing to the manner in which the squirrel disperses his treasures, we can not tell the amount of the store required by each animal, but in Northern America we find one which gives the needful information. This is the chipping squirrel, chipmuck, so called from its cry. Its scientific name is *Tamias Lysteri*.

It is a little creature not larger than a two-thirds grown rat, and is very conspicuous on account of the black and yellow stripes which run along its back. Being a creature which leads a subterranean life for the greatest part of its time, it does not possess the bushy tail of the tree-inhabiting squirrels.

Its underground habitation is a most elaborate composition of galleries and chambers, so that there is plenty of space for storage. Audubon once dug up a nest inhabited by four chipping squirrels, and found in it two pecks of acorns, a quart of large nuts, rather more than two quarts of buckwheat, besides about half a pint of grass seeds and ordinary wheat. Considering that the animals would pass the greater portion of the winter months in lethargy, and would only eat at long intervals, the amount of food is really surprising.

In former days, when the red men were supreme and depended solely on hunting for their food, many a tribe has been saved from extermination for want of food in the winter time by digging up the nests of the chipping squirrel, and eating the inhabitants as well as their stores.

In the dormouse we have another instance of hibernation brought into contact with man.

This pretty little creature, which is too familiar to need description, possesses in a great degree the power of becoming fat toward the end of autumn. The ancient Romans were well aware of this fact, and had regular establishments called "gliraria" for the express purpose of fattening dormice for the table.

The dormouse makes a singularly comfortable nest for itself. It is nearly spherical, and is composed externally of grass blades woven together in a very ingenious manner. The animal only leaves a small aperture, concealed by grass blades which can be pulled asunder when the inmate enters or leaves the nest, and which resume their position like the folds of a drawn curtain. I once had a remarkably fine specimen of a dormouse nest which was cut out of a hedge. The curtain of grass blades was so admirably formed that it could seldom be detected by any one who did not know the specimen.

Around, but not in this nest, the dormouse places its store of

winter food, which is much of the same nature as that of the squirrel, and mostly consists of nuts. For this reason the Germans call the creature by the appropriate name of hazelmaus.

It was made in the fork of a hazel-branch, and was about four feet from the ground, so that the small branches served to strengthen as well as conceal it. The nest was exactly six inches long by three in width, and was made almost entirely of several kinds of grass, the broad-bladed sword-grass being the chief material. Interwoven with the grass-blades were sundry leaves, all hazel and maple, and none of them having been taken from the branch on which the nest was built. It is therefore possible that a dormouse may have placed the nest in Mr. Waterton's mill-stone. I do not, however, think it probable, because there was no bush near the stone, and, as far as is known, the dormouse always stores its food close to its nest. The squirrel, however, ranges farther afield, and may often be seen in the winter-time digging through the snow, at some distance from its tree, so as to disinter the hidden food.

Another vegetable-eating hibernating rodent is the too well-known hamster (*Cricetus frumentarius*) of Northern Europe.

It is about a foot in length, but, on account of its numbers, is a most formidable enemy to the agriculturist. Even when seeking its daily food it is terribly destructive to the crops, but its worst raids are made at the end of the autumn, when it provides a store for the winter. For this purpose it excavates a deep and complicated system of burrows, in which it stores a quantity of grain so enormous that after the harvest the farmers are in the habit of digging up the hamster's burrows and securing their stolen property.

A single hamster carried off sixty pounds of wheat for its winter store, while another had thought that a hundred weight of beans were necessary for its subsistence. The animal wakes very early from its hibernation, sometimes even in February. It does not, however, come out of its burrow at once, but remains beneath the earth until the warm weather has fairly set in.

Now we come to the bears.

I need not say that intertropical bears do not require to hibernate. Moreover of those bears which inhabit the colder climates the adult males seldom, if ever, hibernate, while the young of both sexes are very uncertain in this respect. For example, with the grizzly bear the young males and females are found at large throughout the whole of winter, and the same is the case with the polar bear. With the brown bear of Northern Europe and the black bear of North America the young animals seem to be rather capricious in hibernating.

In all cases, however, when the adult female bear is about to add to the family she prepares for hibernating. With the exception of the polar bear, who is obliged to form a most remarkable habitation, the female chooses a safe retreat long before it is required, and gradually conveys into it a large quantity of leaves, moss, and small branches, so as to make a comfortable bed.

Shortly before hibernating she becomes enormously fat, and the new fur which she puts on is quite half as long again as that of the summer raiment. Hunters, therefore, are naturally anxious to kill the bear just before hibernating.

In the first place, a fully developed winter fur, taken before it has been injured by use, will sell for twice as much money as the fur of the same animal when taken in summer or after hibernating. In the next place, the fat, which is so well-known as "bear's-grease," always commands a ready sale. Lastly, as bear's meat, prepared either by freezing or smoking, forms the greatest part of winter food in many a family, it is a matter of the greatest consequence to have that meat in the best condition.

How valuable it is under such circumstances may be realized by reading the life of the old American hunter, Daniel Boone, and seeing how, when his wife and children were nearly dying of hunger and cold, he forced his way across the half-frozen river, succeeded in killing a bear, and by almost superhuman

exertions transported all the meat across the river to his hut.

Supposing that the bear is not interrupted in her work, she retires to the den just before winter, and closes the entrance as well as she can.

In this place of refuge the young are born. They are at first scarcely larger than rats, but increase in size, drawing the whole of their nourishment from their mother, who takes no food during the whole of the winter and early spring. In consequence, when she and her young emerge, the latter are fat and strong, while the mother is but the shadow of her former self. Here again is a wonderful example of the many ways in which God "giveth meat to all flesh."

When a male or young female hibernates it comes out of its refuge as fat as it was on entering it. The hibernation is so perfect that there is scarcely any waste of tissue, as is the case with the mother bear, whose young practically subsist on the store of fat which she laid up in the autumn.

The polar bear when about to become a mother is obliged to find a very different kind of refuge, as there are neither caves, hollow trees, or branches, and often there is nothing but ice as a resting-place and snow as a covering. So she depends for shelter upon the snow. After selecting a convenient snow-drift, she scrapes a hole in it, and suffers the snow to fall upon her as it will.

In that country, where even the human inhabitants are obliged to make their houses out of snow or perish, she is soon buried under many feet of snow. Her thick fur keeps the snow from contact with the skin, while the heat of her body gradually melts the snow away from around her, so that she lies in a sort of tent.

Now comes the question, ventilation. Were she alone all the time she would need no communication with the external air, as the hibernation would be perfect, and respiration would not be required. But her young, who do not hibernate, must breathe continually from the time of their birth, and she, being disturbed by them, is forced to breathe occasionally.

Now, it is found that when animals are buried under snow their warm breath continually ascends, and makes a passage into the air. The aperture is a very small one, but quite sufficient for the purpose; and even in our Scotch Highlands sheep are enabled to breathe in a similar manner when buried in the terrible snow-drifts, which are apt to overwhelm whole flocks at a time.—*London Sunday Magazine*.

ZENOBIA.

By ADA IDDINGS GALE.

Midst clash of arms, she comes, and glittering spear,
Bold, bright and beautiful, her flashing eye;
Crowned, gemmed and robed in cloth of Tyrian dye.
Palmyra's pride, unequalled far or near.
Proudly she moves and with imperious mien
Views with a sweeping glance each column o'er,
While they in rapture kneeling do adore,
And rising, vow allegiance to their queen.
The trumpet's peal, a thousand helmets shine,
The long ranks into perfect order pass,
And at the command move on. Alas!
That fortune's star for such should e'er decline,
That pomp of pride, that dreams of regal sway
Should like the mists of morning melt away.

THE man of the least mental powers may be perfect if he move within the limits of his own capacities and abilities, but even the noblest advantages become obscured, annulled, and annihilated, when symmetry, that is so indispensable, is broken through. This mischief will still oftener appear in these present times; for who will be able to satisfy the requirements of a present ever calling for more exertion and in the highest state of excitement?—*Goethe*.

CHARACTER BUILDING.

By JAMES KERR.

Failure in any enterprise often rouses to fresh effort. You fall in order to rise again. You are thrown down that you may rise higher. Failure may thus carry in its bosom a rich harvest of good. In men of spirit, who are not easily cowed, it acts as a spur to exertion. Every time such a man is thrown down, and, like the fabled Titan, touches mother earth, he rises again with renewed strength. Many a great orator has failed ignominiously in his first attempt; but if he has the right stuff in him he is not disheartened. Like the late Lord Beaconsfield, he says indignantly: "The time will come when you will hear me!" He says it, and he keeps his word. We have a similar instance in M. Thiers, the French historian and statesman. When as a young man he made his *debut* in the Chamber of Deputies, his speech was not a success. He felt that he had failed. On returning home he said to his friends, "I have been beaten; but never mind, I am not cast down, I am making my first essay in arms. Beaten to-day, beaten to-morrow; it is the fate of the soldier and the orator. In the tribune, as under fire, defeat is as useful as a victory. We begin again!" Such was the spirit of the man, such his indomitable resolution; and we all know that his efforts were at last crowned with complete success.

Failure, disappointment, and difficulties to be surmounted, doubtless contribute an element of strength to the character. We thus learn to persevere in a difficult task. Speaking of the failures, delays, and obstacles met with at the siege of Troy, Shakspeare puts these words into the mouth of Agamemnon—

"Which are, indeed, naught else
But the protractive trials of the great Jove,
To find persistivè constancy in man."

Trials, misfortunes and difficulties of every kind, if properly met, are a means of discipline. In the struggle with them we are made stronger. They brace the mind, and give it firmness. A disposition naturally gentle requires this tonic to prepare it for the rougher duties of life. Many can say that the disappointments and trials they have met with have given a firmness to their temper which was much needed, and have been of the greatest service to them.

I have never known any one who had difficulties to contend with in his youth, and who wrestled with them successfully, who was not thankful for them later in life. They felt that these difficulties, resisted and overcome, helped to mould their character and make them stronger and better men than they would otherwise have been.

We read in the letters of Thomas Erskine, of Linlathen, as follows: "A friend of mine once repeated to me a sentence which he thought utter nonsense, but to me it seemed to have a meaning. *What were rocks made for, my brethren? Even that mariners might avoid them.* There was a gain in having avoided rocks, which there would not be if rocks had never existed."

In the same manner we may say, What was evil made for? Even that we may avoid it. There is a gain in having avoided and resisted evil, which there would not be if evil had never existed.

The trials and troubles of life afford an education to which no other is equal. We have not the finest type of character in the monk and the nun, who lead a life of seclusion far away from the evil of the world. Their virtues are only negative. It is not among those who are shut up within stone walls and jealously guarded, that you obtain the noblest type of character. On the contrary, it is among those who have had to struggle with evil in all its forms in the strife and conflict of life. In this way virtue is strengthened, and a character formed nobler than a life of mere innocence could impart.

It is seen that in those places where there is the greatest

amount of vice, there are also to be found many examples of the greatest virtue. It is said that nowhere are there such good people as in London, and the reason assigned is that nowhere are there so many bad people. The Londoner lives in the midst of temptations which have to be avoided and resisted—thus the habit of virtue and of self-control is formed. Those who are good, in spite of manifold temptations to evil, are likely to be very good. Their virtue will be of a more robust type than that of those who are immured in nunneries, and who are kept innocent by temptation being removed out of their way.

There are two ways of dealing with mankind. You may remove them from every temptation, and thus keep them innocent in outward act. Or you may place them in the midst of temptations, trusting to their power of resisting them. You wish, for example, to guard a man from the habit of drunkenness. You shut him up within stone walls, where the very smell of drink is unknown; or you place him in a lonely island, where there is no beverage to be had stronger than pure water.

In this way you get rid of the temptation, but you sacrifice the man. You make of him a nonentity. Others, not less wise, would pursue a different course. They would leave him a free agent in the world, with all its trials and temptations. The probability is he would defend himself from the danger; for, after all, even in the most drink-loving nations, it is only a small proportion of the population that give way to this vice. This latter method has the advantage, instead of sacrificing the man, of improving him. It contributes an element of strength to his character, and trains him to be a brave soldier in the battle of life.

There is much in this avoidance of evil and keeping it in check. It is the great means available for the development of our moral nature. What exercise is to the body, resistance to evil is to the mind.

THE RECREATIONS OF THE PARIS WORKMAN.

By R. HEATH.

The recreations of the better class of Paris workmen wear a character of Arcadian simplicity.

On fêtes, and especially during that of the Republic, which, though nominally confined to the fourteenth of July, continues for several Sundays afterward, there is much dancing and all the ordinary amusements of a fair.

The first day of the week, is, however, only a holiday once a month, for the majority of workmen. On the afternoon of pay-day the workman takes his family outside the barrier for a walk into the country. They have a simple dinner at one of the numerous restaurants in the neighborhood, and wander in the woods, plucking the wild flowers, or find a quiet nook, where one of the party reads aloud. These happy afternoons fill the workman's heart with joy, and he begins to recall his childhood and to talk of his old home in some distant province. He takes his wine, is joyously excited, but nothing more; the whole family return by train or tram-car, laden with lilac or wild flowers, and are safe in bed by eleven o'clock.

Saturday evening is the favorite time for the theater. The workman prefers the drama, and if the scene is pathetic, is easily moved to tears.

On Sunday afternoon a few visit the Louvre, the Luxembourg, and the Salon, and other picture galleries when open. They are observed to fix their attention mostly on historical scenes, or pictures which touch the feelings; a scene from the Inquisition, a mother weeping over her children, or an inundation, or a famine.

Compared with the German, the Paris workman can hardly be said to possess any musical faculty whatever. The loud and harsh noises to be heard night and day in Paris indicate that

the popular ear must be in an almost infantine condition. Cracking their whips with the utmost violence is the ceaseless delight of Parisian drivers, and during the fête and for many days after, the urchins on the street render life unsupportable by constant detonations of gunpowder.

To judge from the way the workmen gather round bookstalls, and the avidity with which the young among them may be seen devouring a book while waiting for the tram, reading must be a real enjoyment to the more intelligent. I have seen a young fellow in a blouse reading a book as he sat astride on the back of a heavy cart-horse. A friend, a lady who has made friends with a family at Belleville, finds them not only to possess a good library, but to be well acquainted with French literature. When a workman is a reader his taste will be good. He will despise novels, especially of the vicious order; his favorite books are histories of the Revolution, such as Lamartine's "Girondins;" Louis Blanc's "Dix Ans;" "Histoire de Deux-Décembre," etc.; and for classics, Voltaire, Rousseau, and perhaps Corneille.

If in the present adult population many may be found with literary and artistic tastes, the workmen of the next generation will be educated men, in the vulgar sense of the word; for it would be difficult to give adequate expression to the fury with which the instruction of the people is pressed forward. All classes combine; the Republicans because they sincerely believe that popular instruction is the great panacea for all the ills of the world; Conservatives, because they hope that it will make the people reasonable; Catholics, because they fear to lose even those who still hold to the church.

Primary instruction is now compulsory and gratuitous. The choice of the school rests with the father or guardian, but he can not neglect to have his child instructed by some one and somewhere. The communal schools are excellent, and the greatest pains taken with the instruction. For the present generation there are multitudes of lecture courses, popular and gratuitous. I have no means of exactly knowing the number, but it is said that there are now in Paris during the season as many as 2,000 courses of lectures of one kind or another. A very great number of these are open to the public.

In a speech made last December at the West London School of Art, Mr. Mundella, M.P., stated that he had recently been in France for the purpose of inquiring into the new system of education, which came into operation on the 1st of October last year, and that while there he had spent some time in trying to ascertain the progress the French were making in giving instruction in art. The Vice-President of the Council declared himself "perfectly astounded by the facts that had come to his knowledge on the subject. He had seen in Paris placards, six feet long, offering gratuitous instruction to every person employed in certain trades who would come and accept it. He found schools of art, which were attended by hundreds and thousands of students, in every part of the country. These schools were supported, not only by government aid, but by the different municipalities out of the local rates and taxes. Thus all the artisans of Paris, and a large number of those in the country, were receiving gratuitous art instruction. The Paris municipality expended £32,000 in this way last year, and that sum will be largely exceeded during the present year. He had brought with him the 'Paris Budget for Education' for next year (1883), and he found from it that that city with its population of 1,900,000 would spend on education double the amount that was expended for the education of the four millions who lived in London."

Why then may we not hope to see many Garfields in the French Republic? The first great difficulty is the strong feeling of caste which exists as powerfully in the workman as in any other class.

M. Poulot has related an amusing instance of the way a young lady of the middle class and her mother turned away from him with a kind of horror when they learnt that he actually worked

in a factory, and helped to make the steam engines. But I have met with an instance quite as startling on the other side. Meeting at the house of a mutual friend, an orator, who, a few days before, I had heard deliver a strong philippic against the government, at a meeting mainly composed of workmen, and on a question of interest to them, I asked him to introduce me to one of his friends. He assured me that he only knew them in the meetings, but that he did not know the address of any. Nothing could give a stronger impression of the immense chasm between the working class and those not actually members of it, than to find one of their prominent advocates—a man who, I believe, has been devoted for years to their cause—without a single private friend among working-men.—*Good Words.*

A RUSSIAN NOVELIST.

By GABRIEL MONOD.

France has just lost an author who, though he never wrote in French, had made France his adopted country, and had been adopted by her as one of her most illustrious novelists—Ivan Tourgénéf. From the time when the petty persecution of the Russian government obliged him to leave his native land, he settled in France with his friends the Viardots, paying only short occasional visits to Russia. It was at Bougival, near Paris, that he died on the third of September, of a painful disease from which he had been suffering for more than two years. His works were often translated into French from the manuscript itself, and appeared simultaneously in French and in Russian; and though he depicted Russian types and manners exclusively, his reputation was as great in Paris as at St. Petersburg, and he passed with the general public for a great French writer. He has contributed, more than any one else, to make Russia understood in France, and to create a sympathy between the two nations. Contemporary Russia lives complete in his works. In his "Memoirs of a Russian Nobleman," or "Recollections of a Sportsman," he has given expression to the sufferings, the melancholy, the poetry, of the Russian country-folk, and prepared the way for the emancipation of the peasants; in "A Nest of Nobles" he has depicted the monotonous life of the lesser gentry, living on their small fortunes in the heart of Russia; in "Dimitri Roudine," in "Smoke," and in "The Vernal Waters," we find those Russian types which are met with all over Europe—those nomads whose incoherent brains are seething with all sorts of ideas, social, political, and philosophical; those spirits in search of an ideal and a career, whom the narrow and suffocating social life of Russia has turned into idlers and weaklings; those worldlings, with their eccentric or vulgar frivolity; those women, amongst whom we may find all that is most cruel in coquetry and most sublime in self-devotion. Last of all, in "Fathers and Sons," he has revealed, with a prophetic touch, the first symptoms of that moral malady of Nihilism which is eating at the heart of modern Russia, and in "Virgin Soil" he has given us a faithful and impartial description of the society created by the Nihilistic spirit. Tourgénéf is a realist; his personages are real, his pictures are drawn from life, his works are full of true facts; but he is at the same time a true artist, not only in virtue of the power with which he reproduces what he has seen, but because he has the faculty of raising his personages to the dignity of human types of lasting truth and universal significance, and because he describes, not all he sees, but only what strikes the imagination and moves the heart. He is wholesomely objective; he does not describe his heroes, he makes them act and speak; the reader sees and hears and knows them as if they were living people—loves them and is sorry for them—hates and despises them. Tourgénéf is one of those novelists who have created the greatest number of living types; he is one of those in whom we find the largest, the most sensitive, the most human heart. He has shown, like Dickens, all that warmth of heart can add to genius.—*The Contemporary Review.*

A LAY OF A CRACKED FIDDLE.

By FREDERICK LANGBRIDGE.

When I was quite a tiny mite,
 And life a joyful ditty,
 I used to know a poor old wight
 Who fiddled through the city.
 Alas! it's thirty years ago—
 Time *is* so quaint and flighty!
 And now I've mites myself, you know,
 And not so very mighty.
 And he's unvexed by flat and sharp;
 He's guessed the awful riddle,
 And, haply, got a golden harp
 In place of that old fiddle.

And yet, methinks, I see him now—
 So clear the memory lingers—
 His long grey hair, his puckered brow,
 His trembling, grimy fingers,
 The comforter that dangled down
 Beyond his waist a long way,
 The beaver hat with battered crown,
 He'd pause to brush—the wrong way,
 The brown surtout that still could brag
 Its buttons down the middle,
 And, crowning all, the greenish bag
 That held the sacred fiddle.

Two tunes he played, and only two,
 One over, one beginning;
 "God Save the Queen's" collapse we knew
 Was "Kitty Clover's" inning.
 How startlingly the bow behaved—
 Curveted, jerked, and bounded—
 The while our gracious queen was saved,
 And knavish tricks confounded!
 And oh! the helpless, hopeless woe,
 Brimful and running over,
 In (*very slow*) the o—o—oh
 Of bothering Kitty Clover!

And so he'd jerk and file and squeak
 Like twenty thousand hinges,
 While every sympathetic cheek
 Was racked with shoots and twinges.
 The lawyer left his lease or will,
 The workman stopped his hammer,
 The druggist ceased to roll the pill,
 And ran to calm the clamor.
 From doors and windows jingled down
 A dancing shower of copper,
 Accompanied by many a frown,
 And sometimes speech improper.

He gathered up the grudging dole,
 And sought a different station,
 But always with a bitter soul,
 And deep humiliation.
 For what though music win you pence,
 If praise it fail to win you?
 If fees are paid to hurry hence,
 And never to continue?

"Bad times for art," he'd sometimes say
 To any youthful scholar;
 "They'd rather grub for brass to-day,
 Than listen to Apoller."

And so with quaint, pathetic face,
 Aggrieved and disappointed,
 The minstrel moved from place to place,
 And mourned the times disjointed.
 His hat was browner than of yore,

His grizzled head was greyer,
 And none had ever cried "Encore,"
 Or praised the poor old player.
 I came to feel (and was not wrong)—
 His day was nearly over—
 He'd not be bothered very long
 By cruel Kitty Clover.

One day, within a shady square,
 Where people lounged or sat round,
 He'd played his second woeful air,
 And now he took the hat round.
 He met with many a gibe and grin,
 With coarser disaffection,
 The while he tottered out and in,
 Receiving the collection.
 At length he stopped, with downcast eye,
 Beneath a lime tree's cover,
 Where sat a maiden, sweet and shy,
 Beside her handsome lover.

Half hidden in her leafy place,
 The modest little sitter
 Just glanced into the fiddler's face,
 And read his story bitter.
 Unskilled in life and worldly ways,
 By womanhood's divining,
 She knew the minstrel's soul for praise
 And sympathy was pining.
 Herself with all a heart could need,
 No dearest dream denied her,
 She felt her gentle spirit bleed
 For that poor wretch beside her.

She hung her head a little while,
 Then, growing somewhat bolder,
 She rose, and with a blush and smile,
 Just touched the minstrel's shoulder.
 "How charmingly you play," she said.
 "How nice to be so clever!
 My friend and I" (her cheeks grew red;
 "Could sit entranced for ever.
 I've taken lessons—all in vain;
 My touch is simply hateful.
 Oh! if you'd play those tunes again,
 I'd be so very grateful."

He rosined up his rusty bow
 (His eyes were brimming over),
 Then (o—o—oh!) meandered slow
 Through endless "Kitty Clover."
 He'd suffered many a cruel wrong
 Amid a sordid nation;
 He'd waited wearily and long—
 At last the compensation!
 What cared he now for snub and sneer
 From churlish fools around him?
 In those sweet eyes he saw a tear,
 And felt that fame had crowned him.

And you, my friends, may laugh or frown,
 And still I'll risk the saying,
 That angels stooped from glory down
 To hear the fiddler playing.
 And he that holds the golden pen,
 That chief of all the bright ones,
 Who registers the deeds of men,
 The wrong ones and the right ones—
 He oped the book, and did record
 A sweet and gracious deed there—
 A deed performed to Christ the Lord
 That he shall smile to read there.

BLUE LAWS.

An interesting and suggestive chapter in our early colonial history is found in the constitution, laws and court records of Connecticut. That some of the enactments and judicial proceedings, to those ignorant of the peculiar condition of the colonists, seem ludicrous, and fit to provoke the unfriendly criticism they have received, is not denied. But an honest, competent critic can not take them thus, and will not hastily discredit the intelligence of the men who, under new and most trying circumstances, made such regulations for their little commonwealth as the exigencies of the situation seemed to demand. We do not approve of all the laws of that olden-time as wise and just; nor do we think the administration always beyond just reproach; but we do venerate the men who for the glory of God and the good of society enacted and rigorously enforced them.

The ancient orthography is retained as a specimen of the English of that day:

CONSTITUTION OF 1638.

"For as much as it hath pleased the Almighty God, by the wise disposition of his divine providence, so to order and dispose of things, that we, the inhabitants, and residents of Windsor, Hartford and Weathersfield, are now dwelling in and upon the river of Conneticut, and the lands thereunto adjoining; and well knowing, when a people are gathered together, the word of God requires, that, to the maintienence of the peace and union of such a people there should bee an orderly and decent government established, according to God, to order and dispose of the affaires of the people at all seasons, as occasions shall require; doe therefore associate and conjoine ourselves to bee as one publique State or Commonwealth; and doe for ourselves and our successors, and such as shall be adjoined to us at any time hereafter, enter into combination, and confederation together, to meinteine and preserve libberty, and the purity of the gossple of our Lord Jesus, which we now profess; as also the discipline of the churches which, according to the truth of said gossple is now practiced amongst us, as also in all our civil affaires to be guided, and governed according to such lawes, rules, orders and decrees, as shall bee made, ordered, and decreed, as followeth."

Then follows the constitution in eleven well considered sections, making provision for the three departments—legislative, judicial and executive. We freely confess our admiration of this wonderful document, but can not, for want of room, print it. This is the less necessary as it evidently formed the basis of the charter of 1662, and its leading provisions have been copied, with some modifications, into the constitutions of the several States, and of the United States. As the first written constitution formed for and adopted by a free people, for their own government, it is a marvel of excellence. Written without a model, it asserts for its authors a more comprehensive and thorough statesmanship than is usually attributed to the leaders in colonial politics at that early day.

The most peculiar feature of their civil polity was that only the righteous were to be in authority, and all power was vested in members of the church; and the conservative influence of religion variously confessed. The church and state were separate, yet, not inconsistently, we find an article headed:

"MAINTAINANCE OF MINISTRY."

"Whereas, the most considerable persons in the land came to these parts of America, that they might enjoye Christe, in his ordinances without disturbance; and whereas, amongst many other precious meanes, the ordinances have bene and are dispensed amongst us with much purity and power, they took it into their serious consideration that a due maintenance might bee provided, and settled, both for the present and the future, for the encouragement of the minister's worke therein; and doe order that those who are taught in the Word, in the several plantations, bee called together, that evry man voluntarily sett downe what hee is willing to allow to that end and use; and if any man refuse to pay a meete proportion, that then hee bee rated by authority, in some just and

equall way; and if after this any man withhold, or delay due payment, the civil power bee exercised as in other just debts."

The "Capitall Lawes" were severe, and the executive officers a terror to evil-doers. The death penalty was denounced against criminals convicted of either of fourteen different offenses. The burglar for the third offense lost his life.

1. "If any man after legall conviction shall have or worship any other god but the Lord God, hee shall bee put to death."—Deut. 13:6, 17:2.

2. "If any man or woman bee a witch, that is, hath or consulteth with a familiar spirit, they shall bee put to death."—Exodus 22:18; Levit. 20:27.

3. "If any person shall blaspheme the name of God, the Father, Sonne or Holy Ghost, with direct, express, presumptuous or high-handed blasphemy, or shall curse, in like manner, hee shall bee put to death."

4. "If any man shall commit any willful murder—which is manslaughter committed from hatred, malice or cruelty—not in a man's just and necessary defense, nor by mere casualty against his will, hee shall bee put to death."

8. "If any person committeth adultery with a married or espoused wife, the adulterer and adulteress shall surely bee put to death."

12. "If any man shall conspire or attempt any invasion, insurrection or rebellion against the Commonwealth hee shall bee put to death."

The laws were specially severe against the social evil, and the homes of the colonists guarded not only against the crimes, but against all dalliance with evil, and imprudent conduct that might weaken the family bonds. The purity and bliss of the home might not be endangered with impunity, and the wayward were punished with wholesome severity. Here is a court record: "Martha Malbon, for consenting to goe to the farms with Will Harding at night, to a venison feast, and * * * for dalliance with said Harding was whiped." How it fared with Will we are not told, but presume there was safety for him only in exile, as there was no marked discrimination in favor of his sex at that time. As connected with this case it is further recorded that "Goodman Hunt and his wife for keeping the counsellors of said William Harding, baking him a pastry and plum cakes, and keeping company with him on the Lord's day, and she suffering Harding to kisse her, they being only admitted to sojourn in this plantation on their good behavior, ordered to be sent out of this towne within one month after the date hereof; yea, in a shorter time, if any miscarriage be found in them.—December 3, 1651." On another page I find it recorded that "Will Harding was sentenced to be severely whiped, fined £10, and presently to depart the plantation, and not retourne under the penalty of severer punishment."

A REMNANT OF SUMMER,

By E. O. P.

I went out in the dull autumnal day,
Around me fell the rain,
The bare trees shivered 'gainst the ashen sky,
My heart was full of pain.

High in a maple tree, upon a branch,
The tree-trunk close beside,
A little empty bird's nest, snug and neat,
My tearful eyes espied.

And straightway, for the time, from grief and care
My sad heart was beguiled,
And on this remnant of the summer gone
Through rain and tears I smiled.

Not oft has life so dull and drear a day,
But something bright appears
To speak of sunshine and the spring time flown,
And bring a smile through tears.

THE LIFE OF A PLANET.

By RICHARD PROCTOR.

The material life of a planet is beginning to be recognized as being no less real than the life of a plant or of an animal. It is a different kind of life; there is neither consciousness such as we see in one of those forms of life, nor such systematic progress as we recognize in plant-life. But it is life, all the same. It has had a beginning, like all things which exist; and like them all, it must have an end.

The lifetime of a world like our earth may be truly said to be a lifetime of cooling. Beginning in the glowing vaporous condition which we see in the sun and stars, an orb in space passes gradually to the condition of a cool, non-luminous mass, and thence, with progress depending chiefly on its size (slower for the large masses and quicker for the small ones), it passes steadily onward toward inertness and death. Regarding the state in which we find the earth to be as the stage of a planet's mid-life—viz., that in which the conditions are such that multitudinous forms of life can exist upon its surface, we may call that stage death in which these conditions have entirely disappeared.

Now, among the conditions necessary for the support of life in general are some which are unfavorable to individual life. Among these may be specially noted the action of those subterranean forces by which the earth's surface is continually modeled and remodeled. It has been remarked with great justice, by Sir John Herschel, that since the continents of the earth were formed, forces have been at work which would long since have sufficed to have destroyed every trace of land, and to have left the surface of our globe one vast limitless ocean. But against these forces counteracting forces have been at work, constantly disturbing the earth's crust, and, by keeping it irregular, leaving room for ocean in the depressions, and leaving the higher parts as continents and islands above the ocean's surface. If these disturbing forces ceased to work, the work of disintegrating, wearing away, and washing off the land would go on unresisted. In periods of time such as to us seem long, no very great effect would be produced; but such periods as belong to the past of our earth, even to that comparatively short part of the past during which she has been the abode of life, would suffice to produce effects utterly inconsistent with the existence of life on land. Only by the action of her vulcanian energies can the earth maintain her position as an abode of life. She is, then, manifesting her fitness to support life in those very throes by which, too often, many lives are lost. The upheavals and downsinkings, the rushing of ocean in great waves over islands and seaports, by which tens of thousands of human beings, and still greater numbers of animals, lose their lives, are part of the evidence which the earth gives that within her frame there still remains enough of vitality for the support of life during hundreds of thousands of years to come.

This vitality is not due, as seems commonly imagined, to the earth's internal heat. Rather the earth's internal heat is due to the vitality with which her frame is instinct. The earth's vitality is in reality due to the power of attraction which resides in every particle of her mass—that wonderful force of gravitation, omnipresent, infinite in extent, the property whose range throughout all space should have taught long since what science is teaching now (and has been foolishly blamed for teaching), the equally infinite range of God's laws in time also. By virtue of the force of gravity pervading her whole frame, the crust of the earth is continually undergoing changes, as the loss of heat and consequent contraction, or chemical changes beneath the surface, leave room for the movement inward of the rock-substances of the crust, with crushing, grinding action, and the generation of intense heat. If the earth's energy of gravity were lost, the internal fires would die out—not, indeed, quickly, but in a period of time very short compared with that during which, maintained as they constantly are by the effects of internal move-

ments, they will doubtless continue. They are, in a sense, the cause of earthquakes, volcanoes, and so forth, because they prepare the earth's interior for the action of her energies of attraction. But it is to these energies and the material which as yet they have on which to work, that the earth's vitality is due. She will not, indeed, retain her vitality as long as she retains her gravitating power. That power must have something to work on. When the whole frame of the earth has been compressed to a condition of the greatest density which her attractive energies can produce, then terrestrial gravity will have nothing left to work on within the earth, and the earth's globe will be to all intents and purposes dead. She will continue to exercise her attractive force on bodies outside of her. She will rotate on her axis, revolve around the sun, and reflect his rays of light and heat. But she will have no more life of her own than has the moon, which still discharges all those planetary functions.

But such disturbances as the recent earthquakes, while disastrous in their effects to those living near the shaken regions, assure us that as yet the earth is not near death. She is still full of vitality. Thousands—nay, tens, hundreds of thousands of years will still pass before even the beginning of the end is seen, in the steady disintegration and removal of the land without renovation or renewal by the action of subterranean forces.—*The Contemporary Review.*

DISRAELI'S LONDON.

One of Disraeli's favorite ideas was that London ought to be made the most magnificent city in the world—a real *Kaiserstadt*, or imperial town, a model to all other cities in the character of its public buildings, the sanitary perfection and outer picturesqueness of its private houses, the width of its streets, etc. When Napoleon III. commenced the re-edification of Paris he used to say: "Is it not pitiful that the emperor should be doing by force what we could do so much better of our own free will, if we had a proper pride, to say nothing of good sense in the matter? Once when he was staying at Knole, he launched out into a parody of Macaulay's idea of the New Zealander meditating over the ruins of London Bridge. He imagined this personage reconstructing in fancy a row of villas at Brixton: "What picture he would make of it! he would naturally suppose that knowing how to build, and having just awoken to a knowledge of sanitation, we had built according to the best ideas in our heads." Then he took his New Zealander among the ruins of the stately commercial palaces crowded in narrow lanes all round the Bank, and the Exchange: "He would conclude that there must after all have been some tyrannical laws which prevented our merchants from combining their resources to make their streets spacious and effective, for it would seem absurd to him that intelligent men should, at a great cost, have built palaces for themselves in holes and corners where nobody could admire them properly, when by acting in concert, they might at much less expense have set much finer palaces in noble avenues, courts and squares." Then Disraeli broke out into an animated description of his regenerate London with Wren's four grand approaches to St. Paul's, boulevards transecting the metropolis in all directions; and the palace of Whitehall rebuilt after Inigo Jones's designs to make new government offices. He would have covered the embankment pedestals with statues of admirals set in colossal groups recalling great naval achievements, and he thought Stepney ought to have its cathedral of St. Peter, and containing memorials to all the humble heroes, sailors or fishermen who lost their lives performing acts of courage on the water. When he had finished speaking somebody observed that his plan would cost £200,000,000, and convert every ratepayer into a porcupine. "We may have to pay £500,000,000 in the end for doing things in the present way," he answered; "and as to the porcupine, he is manageable enough if you handle him in the right way."—*Temple Bar.*

TEMPERATURE.

By J. MORTIMER-GRANVILLE.

Such expressions as a "cool head," "hot-headed," and the like, commonly relate to temperament rather than temperature; but it is essential to a full comprehension of the subject before us that the *rationale* of animal heat should be stated, and the laws that govern the phenomenon of temperature actual and subjective, at least cursorily, explained.

Heat and the sensation of heat are two widely different states. When, on a chilly day or after washing in cold water, a man rubs his hands until a glow of heat seems to suffuse them, there is a very slight rise of actual temperature caused by the friction; the feeling is principally due to nerve-excitement, produced mechanically by the rubbing. The blood flows more freely into, and through, the parts excited immediately afterward, as shown by the redness, but the first impression of heat is mainly one of sensation. The feeling and the fact are not even constantly related. A person may feel hot when not only the surrounding temperature but that of his body is low; or, he may feel cold when really overheated. These perverted sensations are occasionally morbid—that is to say, form part of a state of disease—or they may arise from individual peculiarities which, perhaps, render perceptions of a particular class especially acute. On the other hand, there are conditions of the body, and special sensibilities, in which the sense of heat is dulled, and even considerable elevations of temperature are not perceived. It is easy to see how impossible it must be to form a correct judgment of the actual state of heat either around or within us by simple sensation.

Throughout the world, whether man be placed in tropical heat or arctic cold, the temperature of his body must, to maintain health, be preserved at the same point—about 98.4 to .6 degrees Fahrenheit. A very small departure from this universal mean standard constitutes or indicates disease. The external heat is comparatively unimportant, or only of secondary moment, in the economy of nature; we can not rely upon it for the compensation of differences in the heat generated within the body by the organism. Except for the production of a temporary effect, such as to give time for the reestablishment of the normal temperature in a body chilled, as by submersion, external heat is useless for vital purposes. The only way in which it can act is by preventing the loss of more heat, and giving a slight aid to recovery by warming the surface of the body.

If when a person is cold he goes into a heated apartment, or sits before a large fire, he receives with advantage just as much heat as will bring the skin of his body up to the normal standard; as soon as that point is reached, the organism will begin to labor to get rid of the superfluous caloric, and by sweating the heat must be kept from rising above the standard. All the heat thrust upon the body above 98.6 degrees is waste and mischievous except in so far as it may promote perspiration, which probably helps to work off some of the useless and burdensome, possibly morbid and poisonous, materials that oppress the system. This is how Turkish baths, and "sweatings" generally, do good, by exciting increased activity of the skin, and, as it were, opening up new ways of egress for matters which, if retained, might offend.

So far as the heat of the body is concerned, whether in health or disease, every degree of external heat which is above the complement to form 98.6 degrees Fahrenheit with the heat of the body itself at the time, is useless and may do harm. It follows that in fever the surrounding atmosphere should be kept cool; in depressing disease, when the heat-producing powers of the organism are small, the air around should be warm. These are precisely the conclusions to which experience and observations conduct us; and the facts now briefly stated explain the reason why.

There is no warmth in clothes; the heat comes from the body itself, generated within, or the surrounding atmosphere, or from substances with which the body may be in contact. Of course clothes, like any other materials, can be charged with heat, and will take up as much thermic or heating property as their specific capacity allows. It is this capability of receiving heat which constitutes the first condition of warmth in the comparative value of different materials of dress. The second condition consists in the physical power of any fabric to hold the heat with which the article has been charged. For example, some materials will become warmer in a given time and retain their heat longer than others under the same conditions of exposure, first to heating and then to cooling influences. The principle of clothing should be to protect the body from external conditions which tend to abstract heat, when the surrounding temperature is lower than that of the body; and to strike heat into the organism, when the temperature of the outside air and of the substances with which the skin may be brought into contact is higher than that of the animal body itself.

Local temperature, that is, the heat in the several regions of the body is determined by conditions which control the circulation of the blood, and the function of nutrition or food appropriation. If the circulation is free in a part, its temperature is maintained; if, from any cause, the flow of blood is retarded, the local heat will be reduced. Any one may put this to the test by encasing the hands in somewhat tight gloves when the weather is cold. The pressure prevents the free passage of the blood through the vessels, and the temperature falls. There is no warmth of any kind in the gloves; they act simply as non-conductors of heat, and prevent the heat generated within the body from passing off. For example—if a piece of lint or rag be dipped in cold water and laid on the skin, and a sheet of impervious or non-conducting material, such as india-rubber or thick flannel, is wrapped closely round, the heat of the body will raise the cold water to a temperature at which it will be given off as steam the moment the covering is removed. When the extremities are enclosed in thick or dense coverings, their temperature will depend on the amount of heat generated within them, and if the flow of blood through the vessels is arrested or retarded, nothing is gained, but everything lost, by the measures taken to protect them from the external cold.

This is a matter of the highest practical moment, and needs to be thoroughly understood. The feet can not be kept warm unless the blood circulates freely in the extremities, and that will not be the case if the boot, shoes, or stockings are tight. These last-named articles of clothing are practically the worst offenders. A stocking encircling the foot and leg closely and enveloping every part, with special pressure at the instep, around the ankle, and above or below the knees, must inevitably tend to oppose the circulation and so reduce the natural heat. The arteries which bring the blood to the extremity are set deeper than the veins that carry it back, and, as the latter are provided with valves which open toward the heart, it is too commonly supposed that the "support" afforded by the stocking will favor the return of blood more than it can impede the deeper supply-currents, and so help the circulation; but practically we know this is not the fact, for a tight stocking ensures a cold foot, and the chilliness of which many persons complain is mainly caused by the practice of gartering, and wearing stockings which constrict somewhere or everywhere.

There is a popular notion that if the feet are cold the head must be hot, and by keeping the extremities warm with wraps the "blood is drawn from the head," and its temperature reduced. Those who have on the one hand studied the phenomenon of fever, and on the other noted the physical condition of races and individuals who habitually leave the extremities unclothed, will know that this theory of the distribution of heat is only partially true. Heat depends on the due supply of nutrient elements to the tissues. It is the expression or result of the process of local feeding. If a part is active it will be

heated. When the feet are left bare the complex muscular apparatus of the extremity, which in a stiff shoe scarcely works, is called into vigorous action, the arch of the foot plays with every step, and each toe performs its share in the act of progression. This promotes growth and calls for nutrition, whereby the heat is maintained; whereas if it be simply packed away as a useless piece of organism, no amount of external heat will warm it. Work is the cause and counterpart of heat throughout the body.

The same principle applies to the head. No amount of external cooling will reduce the temperature, no drawing away of the blood by artificial expedients will permanently relieve the sense or obviate the fact of heat if the organ within the cranium is excessively or morbidly active. The brain is a peculiarly delicate and complicated organ, requiring more prompt and constant nutrition than any other part of the body, because the constituent elements of its tissue change more rapidly than those of any other in proportion to the amount of exercise. Moreover, the brain is always acting during consciousness, and even in sleep it is seldom wholly at rest, as we know from the occurrence of dreams. The faculty of nutrition is highly developed in the organ or it could not so continuously, and on the whole healthily, discharge its functions, even when other parts of the body, or the system as a whole, are suffering from disease. When the head is heated there is nearly always a local cause for it, and the remedy must be addressed to the seat of the malady. The temporary expedient of "drawing away the blood" by applying heat to the extremities is useful as far as it goes, and may suffice to enable the organ to rid itself by the contraction of its blood-vessels from a surplus charge of this fluid, but in the absence of special causes the *reason* of the "heat of head" is undue exercise or disturbance of nutrition in the brain itself. Perhaps the seat of the over-work and consequent heating may have been limited to a particular part of the head; for example, the apparatus of sight, or hearing, as when the head becomes heated by reading too long or in a strong light. The point to understand is that when the head is physically hot it is the seat of too much or disorderly nutrition, and either the amount of brain or sense-power exercised must be reduced or the mode of action changed, and the particular part of the apparatus of perception or thought which has been too severely taxed relieved.

The true condition of health is that in which the temperature of the body as a whole and of its several parts is not disturbed by surroundings either of heat or cold. The preservation of a natural and healthy temperature is mainly to be secured by the maintenance of a regular and well distributed circulation of blood charged with the materials of nutrition.

The first condition of a free and continuous flow of blood is a healthy heart, not hampered by irritants, mental or physical. Sudden grief or fright produces cold by arresting the circulation, and the flow may be permanently retarded by anxiety. The mind has a wondrously direct influence on the heart and blood-vessels—on the latter through the nerves, which increase or reduce the calibre of the minute arteries, as in blushing or blanching at a thought. Instead of loading the body with clothes, the "chilly" should search out the physical cause of their coldness. The blood must not only circulate freely; it must be rich in nourishing materials, and not charged with poison. An excess of any one element may destroy the value of the whole. It is too much the habit of valetudinarians and unhealthy people of all kinds, to charge the blood with substances supposed to be "heating" or "cooling" as they think the system requires them. This is a mistake. The body does not need to be pampered with cordials, or refrigerated with cunningly devised potions. If it be well nourished it will be healthy.

THERE is something fearful in seeing a man of high character being under an obligation to a fool.—Goethe.

SKATING AND SKATERS.

By ROBERT MACGREGOR.

Though it appears to be impossible to fix on the time when skating first took root in this country, there can be no doubt that it was introduced to us from more northern climates, where it originated more from the necessities of the inhabitants than as a pastime. When snow covered their land, and ice bound up their rivers, imperious necessity would soon suggest to the Scands or the Germans some ready means of winter locomotion. This first took the form of snow-shoes, with two long runners of wood, like those still used by the inhabitants of the northerly parts of Norway and Sweden in their journeys over the immense snow-fields.

When used on ice, one runner would soon have been found more convenient than the widely-separated two, and harder materials used than wood; first bone was substituted; then it, in turn, gave place to iron; and thus the present form of skate was developed in the North at a period set down by Scandinavian archæologists as about A. D. 200.

Frequent allusions occur in the old Northern poetry which prove that proficiency in skating was one of the most highly esteemed accomplishments of the Northern heroes. One of them, named Kolson, boasts that he is master of nine accomplishments, skating being one; while the hero Harold bitterly complains that though he could fight, ride, swim, glide along the ice on skates, dart the lance, and row, "yet a Russian maid disdains me."

Eight arts are mine: to wield the steel,

To curb the warlike horse,

To swim the lake, or skate on heel

To urge my rapid course.

To hurl, well aimed, the martial spear,

To brush with oar the main—

All these are mine, though doomed to bear

A Russian maid's disdain.

Specimens of old bone skates are occasionally dug up in fenny parts of the country. There are some in the British Museum, in the Museum of the Scottish Antiquaries, and probably in other collections. There seems to be good evidence that even in London the primitive bone skate was not entirely superseded by implements of steel the latter part of last century.

Mr. Roach Smith, F.S.A., describing one found about 1839, says that "it is formed of the bone of some animal, made smooth on one side, with a hole at one extremity for a cord to fasten it to the shoe. At the other end a hole is also drilled horizontally to the depth of three inches, which might have received a plug, with another cord to secure it more effectually."

There is hardly a greater difference between these old bone skates and the "acmés" and club skates of to-day, than there is between the skating of the middle ages and the artistic and graceful movements of good performers of to-day. Indeed, skating as a fine art is entirely a thing of modern growth. So little thought of was the exercise that up to the Restoration days it appears to have been an amusement confined chiefly to the lower classes, among whom it never reached any very high pitch of art. "It was looked upon," says a writer in the *Saturday Review* in 1865, "much with the same view that the boys on the Serpentine even now seem to adopt, as an accomplishment, the acmé of which was reached when the performer could succeed in running along quickly on his skates and finishing off with a long and triumphant slide on two feet in a straight line forward. A gentleman would probably then have no more thought of trying to execute different figures on the ice than he would at the present day of dancing in a drawing-room on the tips of his toes."

During all this time, when skating was struggling into notice in Britain, in its birth-place it continued to be cultivated as the one great winter amusement. In Holland, too, where it is

looked upon less as a pastime than a necessity, nothing has so frequently struck travelers as the wonderful change the advent of ice brings about on the bearing of the inhabitants. "Heavy, massive, stiff creatures during the rest of the year," says Pilati, in his "Letters on Holland," "become suddenly active, ready and agile, as soon as the canals are frozen," and they are able to glide along the frozen surface with the speed and endurance for which their skating has been so long renowned, though these very qualities are bought at the expense of the elegance and grace we nowadays look for in the accomplished skater. Thomson thus graphically describes the enlivening effects of frost on the Dutch:

Now in the Netherlands, and where the Rhine
Branched out in many a long canal, extends,
From every province swarming, void of care,
Batavia rushes forth; and as they sweep,
On sounding skates, a thousand different ways
In circling poise, swift as the winds along,
The then gay land is maddened all to joy.
Nor less the northern courts, wide o'er the snow,
Pour a new pomp. Eager on rapid sleds,
Their vigorous youth in bold contention wheel
The long resounding course. Meantime to raise
The manly strife, with highly-blooming charms
Flushed by the season, Scandinavia's dames
Or Russia's buxom daughters glow around.

Though the poet of the "Seasons" speaks of Russia here, it is curious to note that skating is not a national amusement of the Russians, but is entirely of foreign and quite recent introduction. It is quite unknown in the interior, and no Russian—except a few who have picked up the art in St. Petersburg—ever thinks of availing himself of the many pieces of water annually frozen hard in so cold a country.

Perhaps it is in Friesland that the skate is most especially a necessary of life. What stilts are to the peasant of the Landes, skates are to the Frisian. The watercourses of the summer are his highways when winter sets in. "He goes to market on skates; he goes to church on skates," we are told; "he goes love-making on skates." Indeed, it may be doubted if this province could be inhabited if the art of skating were unknown, for without it the inhabitants would be confined to home for several months of each year. Frisians of both sexes actually skate more than they walk, says M. Depping; no sooner is an infant able to stand upright than the irons are fastened on his feet; his parents lead him on to the ice, and teach him how to move along. At six years most of the young skaters have attained great proficiency, but in Frisian opinion even the best performers improve up to thirty.

Here, as elsewhere in Holland, ice races are of frequent occurrence during the winter. "The races on the ice," says Pilati, "are the carnivals of the Dutch: they are their fêtes, their operas, their dissipations;" naturally, therefore, the people manifest the greatest interest in them; skate long distances to be present, and cherish the names of distinguished winners in a way we should never expect from such an unemotional people as the Hollanders appear when the ice is gone and when most travelers see them.

The women have races of their own; but most interesting of all the contests are those in which the sturdy dames, whom their own painters delight in depicting as gliding along to market with baskets on their heads and knitting-needles in their busy fingers, are matched against the best of the other sex. Though, as a rule, these "Atalantas of the North" excel the men rather in beauty of style than in speed, yet the prize often enough goes to one of them.

Frequently on the Continent skates have proved themselves excellent engines of war, both in actual fighting—as when a Dutch army on skates once repulsed a force of Frenchmen on the Scheldt—and as a rapid means of communication. During

the winter of 1806, Napoleon, after the battle of Jena, wished to send an order with the utmost dispatch, to Marshal Mortier, directing him to make himself master, without delay, of the Hanseatic towns. The officer charged with this order found himself at the mouth of the Elbe at a point where it was seven and a half miles from bank to bank. To cross in a boat was impossible, as the river was coated with a surface of newly-frozen ice; to get over by a bridge would necessitate a detour of more than twenty miles. The officer, knowing how precious time was, determined to skate over the thin ice; and though it was too weak to bear a man walking, he skimmed along so rapidly that he got across in safety, gaining great honor for the ingenuity and boldness that enabled him to deliver his despatch six hours sooner than he possibly could have done by the ordinary route.

In Holland, regiments have regular parades on the ice; but Norway is probably the only country where it has been considered necessary to embody a special corps of skaters. In this regiment, "the men are furnished," says Mr. Russell, in his translation of Guillaume Depping's book, "with the skates in ordinary use in the North, that fixed on the right foot being somewhat longer than that on the left. Furnished with these, the soldiers descend steep slopes with incredible rapidity, re-ascend them as quickly, cross rivers and lakes, and halt at the slightest signal, even while moving at the highest speed."

Skating has had many enthusiastic votaries, but probably none more so than the two illustrious names that continental skaters are so proud to reckon in their guild.

Klopstock, even in his old age, was so ardent a lover of it that, after skimming over the ice of Altona for hours, "to call back that warmth of blood which age and inactivity had chilled," he retired to his study and wrote fiery lyrics in its praise. His friend and great successor, Goethe, took to skating under peculiar circumstances. He sought relief in violent exercise from embittered memories of a broken-off love affair. He tried in vain riding and long journeys on foot; at length he found relief when he went to the ice and learned to skate, an exercise of which he was devotedly fond to the last. "It is with good reason," he writes, "that Klopstock has praised this employment of our physical powers which brings us in contact with the happy activity of childhood, which urges youth to exert all its suppleness and agility, and which tends to drive away the inertia of age. We seem, when skating, to lose entirely any consciousness of the most serious objects that claim our attention. It was while abandoning myself to these aimless movements that the most noble aspirations, which had too long lain dormant within me, were reawakened; and I owe to these hours, which seemed lost, the most rapid and successful development of my poetical projects."

That skating has been in certain circumstances something more than mere elegant accomplishment, is well illustrated by two anecdotes, told by the author of some entertaining "Reminiscences of Quebec," of two settlers in the far West, who saved their lives by the aid of their skates. In one case the backwoodsman had been captured by Indians, who intended soon after to torture him to death. Among his baggage there happened to be a pair of skates, and the Indians' curiosity was so excited that their captive was told to explain their use. He led his captors to the edge of a wide lake, where the smooth ice stretched away as far as the eye could see, and put on the skates. Exciting the laughter of the Indians by tumbling about in a clumsy manner, he gradually increased his distance from the shore, till he at length contrived to get a hundred yards from them without arousing their suspicion, when he skated away as fast as he could, and finally escaped.

"The other settler is said to have been skating alone one moonlight night, and, while contemplating the reflection of the firmament in the clear ice, and the vast dark mass of forest surrounding the lake and stretching away in the background, he suddenly discovered, to his horror, that the adjacent bank was

lined with a pack of wolves. He at once 'made tracks' for home, followed by these animals; but the skater kept ahead, and one by one the pack tailed off; two or three of the foremost, however, kept up the chase, but when they attempted to close with the skater, by adroitly turning aside, he allowed them to pass him. And after a few unsuccessful and vicious attempts on the part of the wolves, he succeeded in reaching his log hut in safety."

BOOK KNOWLEDGE AND MANNERS.

By LORD CHESTERFIELD.

I have this evening been tired, jaded, nay, tormented, by the company of a most worthy, sensible and learned man, a near relation of mine, who dined and passed the evening with me. This seems a paradox, but is a plain truth, he has no knowledge of the world, no manners, no address; far from talking without book, as is commonly said of people who talk sillily, he only talks by book; which in general conversation is ten times worse. He has formed in his own closet, from books, certain systems of everything, argues tenaciously upon those principles, and is both surprised and angry at whatever deviates from them. His theories are good, but, unfortunately, are all impracticable. Why? because he has only read, and not conversed. He is acquainted with books, and an absolute stranger to men. Laboring with his matter, he is delivered of it with pangs; he hesitates, stops in his utterance, and always expresses himself inelegantly. His actions are all ungraceful; so that, with all his merit and knowledge, I would rather converse six hours with the most frivolous tittle-tattle woman, who knew something of the world, than with him. The preposterous notions of a systematical man, who does not know the world, tire the patience of a man who does. It would be endless to correct his mistakes, nor would he take it kindly; for he has considered everything deliberately, and is very sure that he is in the right. Impropriety is a characteristic, and a never-failing one, of these people. Regardless, because ignorant, of customs and manners, they violate them every moment. They often shock, though they never mean to offend; never attending either to the general character, nor the particular distinguishing circumstances of the people to whom, or before whom they talk; whereas the knowledge of the world teaches one, that the very same things which are exceedingly right and proper in one company, time and place, are exceedingly absurd in others. In short, a man who has great knowledge, from experience and observation, of the characters, customs, and manners of mankind, is a being as different from, and as superior to, a man of mere book and systematical knowledge, as a well-managed horse is to an ass. Study, therefore, cultivate and frequent, men and women; not only in their outward, and consequently guarded, but in their interior, domestic, and consequently less disguised, characters and manners. Take your notions of things as by observation and experience you find they really are, and not as you read that they are or should be; for they never are quite what they should be.

* * * * *

A man of the best parts, and the greatest learning, if he does not know the world by his own experience and observation, will be very absurd; and consequently very unwelcome in company. He may say very good things; but they will probably be so ill-timed, misplaced, or improperly addressed, that he had much better hold his tongue. Full of his own matter and uninformed of, or inattentive to, the particular circumstances and situations of the company, he vents it indiscriminately; he puts some people out of countenance; he shocks others; and frightens all, who dread what may come out next. The most

general rule that I can give you for the world, and which your experience will convince you of the truth of is, never to give the tone to the company, but to take it from them; and labor more to put them in conceit with themselves, than to make them admire you. Those whom you can make like themselves better, will, I promise you, like you very well.

A system-monger, who, without knowing any thing of the world by experience, has formed a system of it in his dusty cell, lays it down, for example, that (from the general nature of mankind) flattery is pleasing. He will therefore flatter. But how? Why, indiscriminately. And instead of repairing and heightening the piece judiciously, with soft colors and a delicate pencil; with a coarse brush, and a great deal of white-wash, he daubs and besmears the piece he means to adorn. His flattery offends even his patron; and is almost too gross for his mistress. A man of the world knows the force of flattery as well as he does; but then he knows how, when, and where to give it; he proportions his dose to the constitution of the patient. He flatters by application, by inference, by comparison, by hint; and seldom directly. In the course of the world there is the same difference, in everything, between system and practice.

UNDER THE AUTUMN SKIES.

By MRS. EMILY J. BUGBEE.

The clouds hung loose and gray,
Across the autumn sky,
And at my feet in golden piles,
The dead leaves, drifting lie.
No voice of summer song,
I hear from copse or tree,
The perfume of no summer flower,
Comes floating up to me.

Death's silence over all,
Where music was, and bloom,
Enfolded all the sun-kissed hills,
In drapery of gloom.
I walk as in a dream,
Beneath the brooding sky,
While faded, as these autumn leaves,
Life's hopes around me lie.

The keen and cruel frost
Has touched my world with blight,
And dark on all its splendors lie,
The shadows of the night.
The memory of its joy,
Like billows of the sea,
Come surging up the silver strand,
Then backward moaning flee.

Amid this sombre calm,
Beneath these skies of gray,
And drifting of the yellow leaves
I walk alone to-day,
And scarce can look beyond
The shadows cold and drear,
That fold, away from mortal sight,
The summer of my year.

In the eternal spring,
Beyond time's changing skies,
Beyond the chilling frost of death,
A resurrection lies.
I can not tell how long,
The snow shall wrap their tomb,
But sometime, shall life's blighted flowers
Burst into splendid bloom.

EIGHT CENTURIES WITH WALTER SCOTT.

By WALLACE BRUCE.

III.

One hundred years have passed away since Richard the Lion-hearted, Ivanhoe and Robin Hood met at the "Joyous passage of arms at Ashby." Our next story, "Castle Dangerous," opens upon days even more bitter and warlike; Scotland is rent with bitter feuds. The daughter of King Alexander the Third died in 1291, and no fewer than twelve persons claimed the throne. King Edward of England was chosen arbiter. He took advantage of sectional discord and endeavored to make Scotland subject to the English crown. He found a willing instrument in the person of John Baliol, who basely acknowledged himself vassal and subject. King Edward further demanded the surrender of three powerful castles, Berwick, Roxburgh and Jedburgh; but the people murmured and Baliol was compelled to do battle with Edward. Under this weak and treacherous leader the Scottish army was defeated in a great battle near Dunbar in 1296. Edward marched through Scotland at the head of a powerful army. He removed to London the records of the Scottish Kingdom, carried the great stone of Scone, upon which the Scottish Kings had been crowned for centuries, to Westminster Abbey, and placed the government of Scotland in the hands of John de Warrene, Earl of Surrey.

At this juncture a leader arose in the person of Sir William Wallace, the son of a private gentleman, and in no way related to the nobility of the kingdom. His glorious struggle kept alive the spark of Scottish liberty. He gathered to himself a band of brave men, and defeated the English army near Stirling. The Scottish people, as they had no king, chose him Protector, and he was titled Sir William Wallace, Governor of the Scottish Nation. He was defeated, captured by a traitor, brought to trial in the great hall of William Rufus in Westminster, sentenced to death as an outlaw, his body divided into four quarters and placed on London bridge.

Among the followers of William Wallace were two powerful barons, Robert Bruce and John Comyn, whose claims were about equal, by descent, to the Scottish throne. They met before the high altar in the Church of Dumfries. What passed betwixt them is not known; but they quarrelled and Bruce slew him with his dagger. Scott puts a defence of this high-handed deed in the mouth of Robert Bruce which we will quote later. Having committed an act which would bring down upon his head the fierce anathema of the Romish Church, which would moreover arouse the King of England and the powerful family of Comyn, Bruce determined to put them all to defiance, and was crowned King of Scotland at the Abbey of Scone the 29th of May, 1306. Among his devoted friends was James, Lord of Douglas. His castle was on the border of Scotland, and it is in the vicinity of this castle, known as Castle Dangerous, that the scene of our romance is laid. So much for the historical preface which may be of service to the reader in connection with the incidents under our consideration.

In the old chronicles and poems of Scottish history, notably that of Barbour, considerable space is devoted to the adventures of Douglas. His castle was captured again and again by the English; but the victors held it at such hazard against the attacks of the adventurous Douglas, that it was considered a perilous and uncertain piece of property. With a romantic enthusiasm, in keeping with those chivalrous times, Lady Augusta, a wealthy English heiress, distinguished for her beauty, promised her hand and fortune to the knight, who would show his courage by defending the castle against the Scots "for a year and a day." A brave knight, John de Walton, started up and said "that for the love of that lady he was willing to keep the Perilous Castle for a year and a day if the King pleased to give him leave." The King gladly gave his consent, being

well pleased to get so brave a knight for such an important fortress.

There was an old prophecy of Thomas the Rhymer, that as often as the Castle of Douglas should be destroyed it would arise grander and stronger than ever from its ruins. The prophecy had already been fulfilled and its great walls seemed able to withstand the most powerful siege. Some manuscripts of Thomas the Rhymer were also preserved in the Castle, and our first chapter opens with a description of two travelers, showily dressed in the fashion of the wandering minstrels of the day, apparently father and son, making a pilgrimage to the castle with the avowed purpose of finding some of the papers or books of the old poet. They are lodged at the house of one Thomas Dickson. They arouse the suspicion of two English soldiers who are quartered at the Dickson farm-house. The elder minstrel is conducted to the castle and imprisoned; the younger is placed in a neighboring convent. By this time the reader begins to suspect that the younger minstrel is no other than the fair Lady Augusta, making a trip under disguise of a minstrel-boy to see how her knight is prospering. Attended by her father's minstrel she reminds one of Rosalind in "As You Like It," under the guidance of the faithful Touchstone. During her detention at the convent she confessed her secret to Sister Ursula, and they escape by night through a trap-door and subterraneous passage, although the convent is strongly guarded. They separate, and by rather an unnatural process again meet at the Douglas Kirk, where the services of Palm Sunday are converted into a warlike controversy. A hand-to-hand conflict, worthy of the Homeric heroes, is recorded between Lord Douglas and De Walton. In the midst of the fray a herald arrives, announcing the defeat of the English army, and the first triumph of Robert Bruce. De Walton surrenders to Douglas, who allows him without ransom to return to England with the Lady Augusta, and unlike the seven years' toil of Jacob for Rachel, the daughter of Laban, which was lengthened to fourteen years, the one year and a day was shortened, no doubt to the great delight of the interested parties.

The most dramatic incident in the story is the midnight interview between the English knight, De Valence, and the old sexton in the ruined burial-place of the Douglas Kirk. The story throughout is chivalrous and romantic; but "Castle Dangerous" does not rank with other stories of the Waverley series in power, incident or dramatic unity. I have already alluded to "Count Robert of Paris" as the last of the Waverley Novels written by the great magician, and it is so regarded, as "Castle Dangerous" was never really completed by the author; but it serves as a connecting link in the great chain, and, in spite of its incompleteness, gives a graphic description of years eloquent with prowess and manly courage.

There are five poems of Sir Walter which I deem worthy of association with the Waverley Novels, viz: "The Lord of the Isles," "The Lay of the Last Minstrel," "The Lady of the Lake," "Marmion," and "Rokeby," which I propose to consider, each in its place.

"The Lord of the Isles" is associated with the same stirring events as "Castle Dangerous," and presents a faithful portrayal of the adventures and history of Robert Bruce. It opens at Ardtornish Castle whose ruins still rise bold and towering on the coast of Morven. I saw it once in the gray gloamin' of an August evening, on my return from Staffa and Iona; and the opening canto of the poem was impressed upon my mind at that time, in lines never to be effaced. As I sat upon the deck of the steamer I heard the minstrel song again echoing among the crags—"Wake Maid of Lorn"—prelude to the wedding festivities already arranged but destined to be long delayed. I saw Lord Ronald's fleet again sweep by

"Streamered with silk and tricked with gold,
Manned with the noble and the bold
Of Island chivalry."

I saw the solitary skiff, bearing the hope and pride of Scotland,

making slow and toilsome progress, with rent sail and gaping planks, and heard above the roar of the tempest the calm reply of King Robert to his impatient brother :

"In man's most dark extremity
Oft succor dawns from heaven."

I saw the lights of the castle again gleam over the dark billows as the door opened to the regal wanderer asking shelter. I saw the haughty look of the proud Lorn, his lifelong enemy. I saw the bridal feast changed into warlike debate, and Scott's lines came to my mind with pictured force :

"Wild was the scene; each sword was bare,
Back streamed each chieftain's shaggy hair
In gloomy opposition set,
Eyes, hands, and brandished weapons met;
Blue gleaming o'er the social board,
Flashed to the torches many a sword;
And soon those bridal lights may shine
On purple blood for rosy wine."

I saw the Abbott, with hoodless head and withered cheek stop upon the threshold, while

"Threat and murmur died away,
Till on the crowded hall there lay
Such silence as the deadly still,
Ere bursts the thunder on the hill;
With blade advanced, each chieftain bold
Showed like the sword's form of old,
As wanting still the torch of life
To wake the marble into strife."

I heard the haughty words of Argentine demanding Bruce, as England's prisoner, and the loud turmoil of fiercer chiefs demanding his life, while the brave Ronald cries :

"Forbear!
Not in my sight while brand I wear,
O'ermatched by odds, shall warrior fall,
Or blood of stranger stain my hall!
This ancient fortress of my race
Shall be misfortune's resting-place,
Shelter and shield of the distressed,
No slaughterhouse for shipwrecked guest."

I heard the Abbott's stern charge asking the heroic King if he knew reason aught, why his curse should not be pronounced in requital of that rash deed at the high altar of the Church of Dumfries. I heard the eloquent defense of the King, and the unexpected and sublime blessing of the Abbott.

"Abbott!" the Bruce replied, "thy charge
It boots not to dispute at large.
This much, howe'er, I bid thee know,
No selfish vengeance dealt the blow,
For Comyn died his country's foe.
Nor blame I friends whose ill-timed speed
Fulfilled my soon-repentent deed,
Nor censure those from whose stern tongue
The dire anathema has rung.
I only blame my own wild ire,
By Scotland's wrongs incensed to fire.
Heaven knows my purpose to atone,
Far as I may, the evil done,
And hears a penitent's appeal
From papal curse and prelate's zeal.
My first and dearest task achieved,
Fair Scotland from her thrall relieved,
Shall many a priest in cope and stole
Say requiem for Red Comyn's soul.
While I the blessed cross advance,
And expiate this unhappy chance
In Palestine, with sword and lance.
But, while content the Church should know
My conscience owns the debt I owe,

Unto De Argentine and Lorn
The name of traitor I return,
Bid them defiance stern and high,
And give them in their throats the lie;
These brief words spoke, I speak no more,
Do what thou wilt; my shrift is o'er."
Like man by prodigy amazed,
Upon the king the abbott gazed;
Then o'er his pallid features glance
Convulsions of ecstatic trance,
And undistinguished accents broke
The awful silence ere he spoke.
"De Bruce! I rose with purpose dread
To speak my curse upon thy head,
To give thee as an outcast o'er
To him who burns to shed thy gore;
But, like the Midianite of old,
Who stood on Zophim, heaven-controlled,
I feel within my aged breast
A power that will not be repress'd.
It prompts my voice, it swells my veins,
It burns, it maddens, it constrains!—
De Bruce, thy sacrilegious blow
Hath at God's altar slain thy foe:
O'ermastered yet by high behest,
I bless thee, and thou shalt be blest!
Blessed in the hall and in the field,
Under the mantle as the shield.
Avenger of thy country's shame,
Restorer of her injured fame,
Blessed in thy scepter and thy sword,
De Bruce, fair Scotland's rightful lord,
Blessed in thy deeds and in thy fame,
What lengthened honors wait thy name!
In distant ages sire to son
Shall tell thy tale of freedom won,
And teach his infants in the use
Of earliest speech to falter Bruce."

There is nothing, to my mind, in any poem more dramatic than this unexpected prayer of the abbott; and the reader does not wonder that

"O'er the astonished throng
Was silence, awful, deep and long."

The scene of the poem now changes to the stormy island of Skye, where Sir Walter pauses to give one of his beautiful descriptions in the fourteenth and fifteenth divisions of canto third.

The fourth canto takes the king *en route* past the island of Staffa, with its Fingal's Cave, and Iona, with its sainted shrine—the cradle of Christianity in Britain, now in ruin. His description of Staffa is one of the most beautiful in English verse:

"Where, as to shame the temples decked
By skill of earthly architect,
Nature herself, it seemed would raise
A minster to her Maker's praise!
Not for a meaner use ascend
Her columns, or her arches bend;
Nor of a theme less solemn tells
That mighty surge that ebbs and swells,
And still, between each awful pause,
From the high vault an answer draws,
In varied tones prolonged and high,
That mocks the organ's melody.
Nor doth its entrance front in vain
To old Iona's holy fame,
That nature's voice might seem to say,
'Well hast thou done, frail child of clay!
Thy humble powers that stately shrine
Tasked high and hard—but witness mine!'"

In canto fifth the king returns to Scotland. He rallies his

adherents, and the sixth canto closes with a graphic description of the battle of Bannockburn. The incidents are so stirring that we almost forget the fate of fair Edith and her brave Roland; but the last line of the poem assures us that they are at last happily wedded.

"The Lord of the Isles" does not possess the pleasing qualities of the "Lady of the Lake," or the sustained vigor of "Marmion;" but it is a noble poem throughout, and abounds with passages revealing the deep reverence and exalted character of the author. The reader will note the heart-spoken prayer and God-speed of the priest as King Robert embarks upon his uncertain mission:

"O heaven! when swords for freedom shine
And monarch's right, the cause is thine!
Edge doubly every patriot blow!
Beat down the banners of the foe!
And be it to the nations known,
That victory is from God alone."

In connection with the "Lord of the Isles" and "Castle Dangerous," it is well to read carefully the sixth, seventh, eighth, ninth and tenth chapters of Scott's "Tales of a Grandfather." It is also pleasant to note that the friendship between Robert Bruce and James Douglas was constant and unchanging; in fact, their unwavering trust and fidelity are emphasized by the dying wish of the king, who desired his heart to be carried to Jerusalem after his death, and requested Douglas to take charge of it. It was in fulfillment of a vow which he had been unable to perform—to go to Palestine and fight for the Holy Sepulchre. "Douglas wept bitterly as he accepted the office, the last mark of the Bruce's friendship and confidence. He caused a case of silver to be made, into which he put the heart, and wore it around his neck, by a string of silk and gold." He set off with a gallant train of the bravest men in Scotland. But the doughty James found an opportunity in Spain for a skirmish with the infidels, which he could not let pass; he was overpowered by numbers, and, seeing no chance for escape, he took from his neck the Bruce's heart, and throwing it before him, exclaimed, "Pass first in fight, as thou wert wont to do, and Douglas will follow thee or die." His body was found after the battle lying upon the silver case, and the heart of the Scottish king was returned to his native country, and interred beside the high altar under the east window of Melrose Abbey.

PLANT NUTRITION.

By MAXWELL T. MASTERS, M.D.

A living plant feeds, breathes, grows, develops, multiplies, decays, and ultimately dies. In so doing it receives, it spends, it accumulates, it changes. Some of these processes are always in operation, very generally more than one is going on at the same time, and the action of one is modified by and controlled by that of another. Some circumstances and conditions favor these operations, others hinder them.

The nutritive process has to be entered on the creditor side as a receipt. The plant will indeed feed upon itself for a time, or rather it will feed upon what its predecessor left it as an inheritance for this very purpose, or upon the stores accumulated in the plant itself during the preceding season; thus, when a seed, or rather the young plant within the seed, begins to grow, it is at first unable to forage for itself, but it depends for its sustenance on the materials laid up for its use during the preceding season by the parent plant. So the bud of a tree awakening into life, and beginning its career as a shoot which is to bear leaves and flowers, derives its first meals from the reserves accumulated the autumn previously in the parent branch. Very generally a little water, supplied from without, is required before the plant can avail itself of these stored-up provisions, but this is not always indispensable. Potatoes begin to sprout in their cellars or pits, as growers know to their cost, before they

can have obtained a drop of water from without. In this latter case there is water enough already in the tuber to allow of food being utilized.

A certain degree of useful heat is, of course, quite indispensable. Practically, no plant will feed when its temperature is reduced as low as the freezing point, and in most cases the heat requires to be considerably greater. Each kind of plant, each individual plant, and indeed each part of a plant, feeds, and performs each item of its life-work best at a certain temperature, and ceases to work at all when the temperature falls below or rises above a certain point. The particular degree, whether most or least favorable, varies according to the plant, its age, stage of growth and various external circumstances, which we need only mention, as their effects will be readily understood without the necessity of explanation.

Leaving, however, on one side, the temperature, we have to consider the water which is so essential, not only in the feeding processes with which we are now concerned, but with every other action of plant life. Fortunately there is, in general, no lack of it; the earth and the air contain their shares of this elementary compound in varying proportions and varying modifications as liquid or gaseous. Besides, the plant itself has so much of it that even at the driest condition compatible with life, it still constitutes a very large proportion of the entire weight. Now, it is as a rule when the plant, the seedling, or the bud is at its driest that growth begins, the necessity for food first manifests itself, and the demand for a further supply of water becomes imperative. How is the demand supplied? We have seen that there is no lack of that fluid. How is it to get into the plant?

When one liquid, say spirit, is poured into another, say water, the two gradually mix. If we suppose these liquids to consist of a number of molecules, then, mixture may be taken to be the result of the displacement say of one molecule of water by one molecule of spirit, and so, throughout the whole quantity of liquid, there is displacement and replacement till at length equilibrium is restored and a thorough diffusion results. This power of diffusion does not always exist. The molecules of water and of oil will not mix or diffuse freely through each other. Water containing carbonic acid gas will not mix, in this sense of the term, with water containing acetate of lead.

It may be a truism to say, that for the process of diffusion the liquids must be diffusible, but the fact must be carefully borne in mind in all questions relating to the feeding of plants. In the case of plants, the phenomenon of diffusion, or the gradual admixture of two liquids of different natures, is complicated by the presence of a membrane in the shape of the cell-wall. The water from the outside has to pass through the membrane to reach the protoplasm on the other side. Speaking broadly, there are no holes in the membrane through which the water can pass. Ingress is secured by that process of diffusion to which reference has just been made, and by virtue of which the molecules of the membrane and the molecules of the water shift and change places; the space that was occupied by a molecule of membrane is now occupied by a molecule of water, and *vice versa*. The access, therefore, of water into the interior of a closed cell is the result of the process of diffusion. Where two liquids mix without any intervening membrane, the mixture is called diffusion simply; where there is an intervening membrane, the diffusion process is known as "osmosis."

The raw material (the term is not quite accurate, but for illustration sake it may pass) is that very marvelous substance now called "protoplasm." We must leave it to chemists and microscopists to explain its composition and indicate its appearance.

Diffusion is not equal or alike in all cases; it depends upon the extent to which the two liquids are diffusible, upon their different densities, upon temperature, and a variety of other conditions. So, in the case of osmosis, we have not only the nature of the two fluids to consider, but their relation to the

membrane that separates them. The membrane may be much more permeable to one of the two fluids than to the other. Thus, in the case of a living cell, the membrane or wall is much more permeable to water than it is to protoplasm; and so it happens that, while water readily penetrates the membrane and diffuses itself in the protoplasm, protoplasm does not nearly so readily permeate the membrane as the water. Ingress of water is easy and of constant occurrence, egress of protoplasm is rare and exceptional.

Pure water or weak saline solutions, such as are generated in the soil under certain circumstances, pass readily through membrane—that is, the molecules of the one shift and change places with those of the other—while those of gummy or albuminous substances like protoplasm do not. After a time, if there is no outlet for the water absorbed, or if it is not utilized within the plant in some way, absorption and diffusion cease, the cell becomes saturated with water, and until something happens to disarrange the balance, no more is absorbed. But, even in the case where the cell is saturated with water, it may still take up other liquids, because the diffusive power of those other liquids, in relation to the cell-wall and to the protoplasm, is different from that of water, and this absorption may go on in its way till saturation point is reached for each one of them, just as in the case of water. On the other hand, it may happen that the plant may be saturated with other substances, and incapable of taking up more of them, while at the same time pure water may be freely taken up.

Just so much and no more of each particular substance is absorbed, the exact quantity of each being regulated in all cases by the condition and requirements of the cells, their membranous walls, and their contents. Thus it happens that some particular substances may be found by the chemist to exist in large relative proportions in the plant, while the quantity in any given sample of the soil from which it must be derived is sometimes so small as to elude detection. The plant in this case, or some part of it, is so greedy, if we may so say, for this particular substance, that it absorbs all within its reach, and stores it up in its tissues or uses it in some way, the demand ensuring supply. On the other hand, the soil may contain a large quantity of some particular ingredient which is incapable of being absorbed, or which the plant does not or can not make use of, and, in consequence, none is found within the plant. The supply is present, but there is no demand.

The different physical requirements of the plant supply also the explanation of the fact that different plants, grown in the same soil, supplied with the same food, yet vary so greatly in chemical composition. Thus, when wheat and clover are grown together, and afterwards analyzed, it is found that while lime is abundant in the clover, it is relatively in small quantity in the wheat; and silica, which is abundant in the wheat, is absent from the clover. Poisonous substances even may be absorbed, if they are of such a nature as to be capable of absorption; and so the plant may be killed by its own action—by suicide, as it were.

The entrance of water into the plant and the entrance of those soluble materials which a plant derives from the soil are therefore illustrations of the process of osmosis, and are subjected to all the conditions under which osmosis becomes possible, or under which it ceases to act.

One thing we must strive to impress forcibly on the reader, because, if the notion is well grasped, it will enable him to understand plant life so much more vividly. We allude to the continual changes that are going on throughout the whole living fabric of the plant while in its active condition. Cell membrane, the protoplasm, the entire mass of liquid and solid constituents of which the plant consists, are, as we have seen, made up of molecules, each, as it were, with a life of its own, undergoing continual changes according to different circumstances, acting and reacting one upon another so long as any active life remains.

C. L. S. C. WORK.

By REV. J. H. VINCENT, D.D., SUPERINTENDENT OF INSTRUCTION C. L. S. C.

Readings for the month: "Easy Lessons in Vegetable Biology," by Dr. J. H. Wythe; "Canadian History;" Chautauqua Text-Book No. 24; "Biographical Stories," by Nathaniel Hawthorne; Required Readings, in THE CHAUTAUQUAN.

Memorial Day, Sunday, December 9, "Milton's Day." See "Memorial Days," Chautauqua Text-Book, No. 7. Monday, December 10, may be used if preferred.

Remember the 5 p.m. Sunday "Chautauqua Vesper Service." Observe the hour personally or as local circles. Now and then a brief public service at this hour may be very profitable.

There can be no substitute accepted for the "Preparatory Latin course in English."

One of our faithful members—a member of the class of '84—on the first day of October sent this pleasant greeting to the Superintendent of Instruction: "My Dear Doctor—This is opening day. I must send you a line just to keep it—and the Lord keep you!"

The Sacramento Circle last year answered in writing over 1,000 questions, besides having prepared sixty-two original papers.

A young lady who has charge of a Young Ladies' Seminary in Washington, D. C., recently remarked that she had adopted the Chautauqua Text-Books on History as an auxiliary in her school, as they are so condensed and so carefully arranged. She said that at the last examination of her graduating class the influence of the little Text-Books was visible in the remarkable proficiency of the pupils.

Each C. L. S. C. Local Circle in the study of Biology should secure the services of a local microscopist, if possible. Without the microscope, Biology is like Hamlet with Hamlet left out.

In one of the leading churches of one of the leading denominations in one of the leading cities of the United States, a strange thing has happened. The president of the local circle of the C. L. S. C. made application for the privilege of holding bi-monthly meetings in a room in the basement of the church, so many of the members of the circle being members of the church. The matter was referred to the president of the board, a leading lawyer, who refused the application. When asked why he should exclude such an auxiliary of the church, and especially a circle containing so much of the religious element, he responded that it "could not be a religious organization, because they were studying biology." This is very hard to believe if it were not well vouched for. If the church had been a Methodist Episcopal Church, the editor of this column would have felt at liberty to make a few direct remarks; but, as it refers to another very respectable and very orthodox branch of the Holy Catholic Church, he must content himself with this general announcement. What would this leading lawyer have said to the wise man who said: "Go to the ant, thou sluggard, consider her ways and be wise;" or to that wiser teacher who commanded his disciples to "consider the lilies." Biology zoological and biology botanical being commended in the Bible, and the study being necessary to the fullest interpretation of the Bible, we commend our legal friend to a little more biblical study.

Apropos to the above item is the following communication from an earnest New England member: "At a certain Sunday-school convention this question was given me to answer: 'What is the effect of the Chautauqua course of reading on Christian zeal? Does it tend to increase one's interest in Christian and Church

work?' I answered in substance as follows: 'I am very glad of the opportunity for saying, and saying confidently, that, judging from what experience and observation I have had, as also from the nature of the case, just as whatever is calculated to enlighten and invigorate the mind, deepen, broaden, elevate and strengthen character, to enlarge the soul and warm and ennoble the heart, must tend to intensify Christian zeal, so the Chautauqua course of reading and study, when conducted or pursued in accordance with the projector's idea, can not but tend to have this effect—to deepen and to invigorate, by enlightening, piety. Precisely what we need in our day is a more intelligent piety—a broader and stronger Christian manhood. Our piety generally is too narrow, or superficial, or feeble. We are apt to build up too much on some one side. We are one-sided, unsymmetrical, sanctified in spots only, as it were. We want to be built out more on all sides, that we may be *thoroughly* furnished unto *every* good work—that we may be fruitful in all directions. Meantime, if the cultivation of such a thoughtful, intelligent, reverent piety as the prayerful study of the works and Word of God is calculated to promote, is not calculated to intensify one's interest in and zeal for Christ's cause, it would be interesting to know what could.' Subsequently I dropped a line to one of the members of a circle which I organized a year ago—a bright, Christian young woman, who, though an operative in the mill, yet clearly grasped the Chautauqua Idea, and who, together with as fine a company of young men and women as were ever grouped together for any cause, has most enthusiastically and successfully pursued that idea for a year:—to this young lady I dropped a line, submitting the question: 'Do you find the C. L. S. C. helpful, or otherwise, to Christian piety?' Permit me to quote from her reply: 'Do I love my Savior, or his church, any less for what I have learned the past year? No. A thousand times no. Jesus seems ever so dear to me, as I look up into the starry heavens, and try to recall something I have learned about those wonderful worlds. And when I think of him who created, and who, by his almighty power and wisdom controls and keeps them all in place; when I think of him as my own kind Heavenly Father, though I am poor, and lowly, and ignorant, and weak, and sinful, my heart throbs with gratitude, love and praise—for he owns me as his child! O! I wish I could tell you how happy I feel to-night, my Savior seems so near and dear to me. My heart is full of love to him and to his people; and I do want to do something to help on his glorious cause. I am praying day by day that he will show me my duty, and help me to do it; and I know you will pray for me that I may be faithful and true.' Does not this testimony have the true ring in it? Does this look much as though the C. L. S. C. had secularized the writer's mind, or diverted her energies from church channels? This lady, together with several other members of that circle, is a devoted Sunday-school worker. What is more, not a little of the glowing, enthusiastic zeal expressed above, has been kindled and developed during this very past year of C. L. S. C. reading and study."

OUTLINE OF C. L. S. C. READINGS.

DECEMBER, 1883.

The required readings for December include "Vegetable Biology," Hawthorne's "Biographical Stories," Chautauqua Text-Book, No. 24, "Canadian History," and the required readings in THE CHAUTAUQUAN.

First Week (ending December 8)—1. "Vegetable Biology," to chapter v, page 27.

2. "Biographical Stories," to chapter iii, page 19.

3. "German History" and "German Literature," in THE CHAUTAUQUAN.

4. Sunday Readings for December 4, in THE CHAUTAUQUAN.

Second Week (ending December 16)—1. "Vegetable Biology," from chapter v, page 27, to chapter viii, page 46.

2. "Biographical Stories," from chapter iii, page 19, to chapter vi, page 40.

3. Readings on Physical Science and Political Economy, in THE CHAUTAUQUAN.

4. Sunday Readings in THE CHAUTAUQUAN, for December 11. *Third Week* (ending December 24)—1. "Vegetable Biology," from chapter viii, page 46, to paragraph 10, page 66.

2. "Biographical Stories," from chapter vi, page 40, to chapter viii, page 59.

3. "Readings in Art," in THE CHAUTAUQUAN.

4. Sunday Readings for December 18, in THE CHAUTAUQUAN.

Fourth Week (ending December 31)—1. "Vegetable Biology," from paragraph 10, page 66, to the end of volume.

2. "Biographical Stories," from chapter viii, page 59, to end of book.

3. "Selections from American Literature," in THE CHAUTAUQUAN.

4. Sunday Readings for December 25, in THE CHAUTAUQUAN.

A REUNION AT MILWAUKEE.

The five local circles in Milwaukee named Alpha, Beta, Grand Avenue, Delta and Iota, recently had a grand reunion on the occasion of the visit of the Superintendent of Instruction. It having been announced in the papers that Dr. Vincent would attend the Wisconsin conference and preach Saturday afternoon, the circles decided to give him a reception. The committee on invitation sent out about two hundred invitations gotten up in a very tasteful and unique manner. The envelopes were covered with autumn leaves of most delicate tints, and contained each a square gilt-edged card, also covered with leaves, bearing the monogram C. L. S. C. and the following invitation: "You are kindly invited to meet Rev. J. H. Vincent, D.D., Superintendent of Instruction of the Chautauqua Literary and Scientific Circle on the evening of Saturday, October 6, in the parlors of the Grand Avenue Congregational Church. Reception, 6 to 9. Refreshments, 6:30."

There was also a smaller card containing a neat little device in a circle in the center, representing a hand holding a handkerchief, and a request in the corner that this card be shown at the door.

Besides these two cards there was a green leaf (artificial) in each envelope for a badge, and a little printed slip of instructions, directing each member to wear the leaf as a badge, and explaining the Chautauqua salute to be given Dr. Vincent when he entered the room.

The committees on decorations and on supper made diligent preparations, so that when the time arrived parlor No. 1 was tastefully arranged with vines and flowers, while through the open doors could be seen twelve tables in parlor No. 2 arranged for an inviting feast. Among the decorations was the banner of the class of '86, made of maroon velvet bordered with cream colored fringe, and bearing the class motto, in letters cut from white felt, "We study for light to bless with light."

Above the platform was a diploma granted to Mrs. William Millard of the class of '83, which arrived from Plainfield a few hours before the reception, and was used as an object lesson by the Doctor in his address. The entire event was most joyous, this being the first union meeting of the circles, and the first time many of them had ever met their revered leader. Of his address, what can be said but that it was *like him*; full of uplifting thoughts and helpful ideas of inestimable value to all Chautauquans, and delivered in his delightful manner.

On Sabbath Dr. Vincent conducted a vesper service in the Immanuel Presbyterian Church, the largest in the city. The Chautauquans gathered in an adjoining room, and forming two columns, headed by Dr. Vincent, marched into the audience room where the central seats were reserved for them. Short addresses were given by Bishop Hurst and Dr. Buckley, which, with the impressive vesper service, made the occasion one long to be remembered.

A C. L. S. C. EXPERIENCE.

From an able speech by Prof. H. A. Strong, before the local circle of Erie, Pa., we clip the following: "Says one of the workers and leaders around the C. L. S. C. camp-fire at Chautauqua: 'I was in Missouri, March last, and was compelled to take a freight train to make connection. As I entered the caboose I noticed a little candle on a cracker-box on the side of the car. There was a door on hinges made out of bits of leather, and a rough button held in its place by a screw, closed the door. After the train started, the conductor came in, and, after attending to his duties, stepped to the box, turned the button, opened the door, and took out a package of C. L. S. C. books, recognizable as such anywhere, sat down on a bench and began working with one of the Chautauqua text-books. Of course it was an absolute necessity that I should make his acquaintance. I approached him and asked him what he was doing. He said: 'A friend of mine in St. Louis called my attention to this Chautauqua course of reading. I did not know what it meant, but I knew I ought to read. So, finally, I joined the circle, bought the books, and put them in this box. My brakemen read with me. One of us keeps watch and the others read. Sometimes we are switched off on a side-track, and then we make good progress. Sometimes it is pretty hard work when we have an unusually long run and much freight; but for the sake of the help it is, I am going to hold on to it.' I felt like giving the fellow a round of applause, all alone as I was in the car.' Such an experience of the C. L. S. C. can be duplicated over and over again in the history of any class, and the simple truth is the realization of the vision."

THE C. L. S. C. IN TORONTO.

In Canada the course of study for 1883-4 opened with a meeting of C. L. S. C. workers and their friends in the lecture-room of the Metropolitan Methodist church, Toronto, on the evening of the 29th of September. After a few words of greeting from Mr. Edward Gurney, jr., president of the Toronto Central Circle, Rev. Dr. Thomas, pastor of the Jarvis Street Baptist Church, spoke for a short time on the importance and value of a systematic course of reading. The too common habit of desultory reading, with its waste of time and mental enervation, came in for a vigorous denunciation from the doctor. All reading, he said, should be purposeful and systematic, and no reading can be of any real profit that is not of that character. The C. L. S. C. course answered two supreme questions that can not fail to arise in the mind of any young man who is desirous to rise: "What shall I read?" and "How shall I read?" In this age of great intellectual power it was important that we should avail ourselves of every opportunity for the better equipment of our minds, so that we can use with precision the implements of our profession or calling, whatever that may be. The multitudes that are treading upon each other in the lower levels of life, are the incompetent; no first-class worker in any line need remain idle. The doctor also pointed out that this is a skeptical age, and that we should be prepared to answer, if necessary, the reflections that are being cast upon the foundations of our faith. Before closing he said: "I want to declare my entire sympathy with the work and purposes of this rapidly-spreading Chautauqua tree, from the branchings of which thousands and tens of thousands are gathering with delight and gratitude the most luscious fruit. I thank God for this course of study, by means of which the mind is led into the green pastures and beside the still waters of literature. My mind has been stirred in the matter as it would not have been if I had not examined into it closely, and if I had not been profoundly impressed by the fact that multitudes of our young people spend their spare moments in reading pernicious literature in which the serpent has left his slimy trail. I am going to join this class to-night for myself."

D-IV-3

Rev. Mr. Milligan, of old St. Andrew's Presbyterian church, followed with an earnest, practical address on "How to Read Books." He impressed upon his hearers the fact that books are made for man, and not man for books, and that it is possible for us to abuse the gift of books by becoming literary ceremonialists, just as we can abuse any other good thing. Every investment we make in relation to books should be made with a definite purpose, and should make us richer. In our reading, too, we should have something more ultimate in view than the mere book; we should endeavor to ponder and reflect on the subject which it treats. In this way we become thinkers, and thinking becomes a necessity, and the mind and memory are enriched and strengthened. Mr. Milligan expressed his hearty cooperation and sympathy with the Chautauqua scheme, and his pleasure that it is associated with the churches. A brief round-table conference followed the addresses, in which thought and experience were interchanged, and inquiries as to the methods and progress of the Chautauqua Idea were answered by the president, and by the Canadian secretary, Mr. Peake. The local press is doing good work in bringing the advantages of the scheme before its readers, and public interest is awakening in all directions in regard to it.

SUNBEAMS FROM THE CIRCLE.

C. L. S. C. class of '87 sends out the following circular to its members:

Beloved Friends and Co-Laborers:—We greet you with joy and gladness as we enter upon our four years' college course of reading and study. It is wisely selected and admirably prepared for us in our home life. We that toil ten hours in the shop, office, and store, with the never ending farm life and detail of housekeeping, will know not a little struggle to command forty minutes per day; but we need it and will do it. Mary A. Livermore was forty-five years of age before ever attempting public speaking, and in a decade was queen of the American rostrum. Some of you at Chautauqua, last August, remember the determined earnestness of Louise R. F. Jones. She writes: "Aiken, S. C., Oct. 6. Have formed a local circle of thirteen; first meeting last night at our house, two men, eleven women; sent for our books yesterday. Have persuaded two persons in Augusta, Ga., to join the C. L. S. C. In Langley, a small town eight miles out, my 'Hall in the Grove' has been read, and a circle is the promise. In Spartanburg, S. C., a circle is formed, which, with Aiken, are the only two in the Palmetto State, so far as known." This Pansy Class of '87 ought to graduate at least 10,000, and with five hundred members like our South Carolina friend, it would be accomplished. One of our class travels, and in forty days visited over thirty newspaper offices, begging editors to publish the C. L. S. C. leaflets, and securing their sympathy. Another one, (just completing his three score years) when on trains, goes from car to car, and politely and quietly seating himself in front or back of the passenger, introduces the "People's College." Our motto, "Neglect not the gift that is in thee." Inspired words! Let each one of us make them ours in the best sense. Let us introduce circles as rapidly as possible. Every day that passes now is forty minutes behind, and it is difficult to catch up. It can be done up to the first of January. Class writing paper has been prepared. Communicate with either of the undersigned concerning it. Rev. Frank Russell, Mansfield, Ohio, president Class of '87. K. A. Burnell, 150 Madison St., Chicago, secretary Class of '87.

The Rev. C. S. Woodruff, of Bayonne, N. J., class of '82, was present at Chautauqua this year, and passed under the Arches with the class of '83. On his return home he took occasion to preach upon the subject of education, and mention the Chautauqua plan particularly. As a result he has organized a local circle of over sixty, and it is still growing. He says: "Every pastor ought to visit Chautauqua. After being inspired he

should spread his enthusiasm among all his people. Let us cast out the devil of bad literature by giving the people good reading."

The Johnstown, N. Y., local circle, includes among its officers a critic and an orthoepist—two excellent officers. Much exact knowledge of pronunciation, spelling, use of words, and forms of expression may be obtained at evening sessions, if critical and wise persons are selected.

There is an energetic circle of twelve members at Shushan, N. Y., the outgrowth of one member who began the readings two years ago. There is something contagious in the C. L. S. C.

Nothing could show better the peculiar work of the C. L. S. C. than the following suggestive toasts offered at the "Opening Day Exercises" at Meriden, Conn.; they were: "The C. L. S. C., a beneficial force in the life of a business man; as a coöperative with the duties of a school teacher; for young working people, establishing an alliance between labor and culture; as promoting Christian growth and culture; for the wife and mother at home."

A very pleasant and inspiring piece of news comes from the same circle. A young printer belonging to the circle became so much interested in his studies, and so anxious for further development that leaving his trade he has undertaken a college course. The circle did a kindly act when they presented to him that most necessary book for a student—Webster's Unabridged Dictionary.

A local circle whose work is done by correspondence has been started in the province of Ontario. There are but two members, but a dozen might carry on the work with equal success. For readers who are remote from the regular societies this plan may be utilized and made a means both of culture and of sociability.

A novel and exceedingly useful idea comes to us from Union City, Indiana. On a neatly printed program there is given the outline of the exercises for four months. The circle meets fortnightly, and the date, place of meeting, exercises and participants are given for eight sessions, so that there can be no mistake or misunderstanding about the work to be done. The plan is to be commended to all circles.

The class of '85, C. L. S. C., held a meeting at the grounds of the New England Assembly at Framingham and organized by the election of the following officers: President, Rev. J. E. Fullerton, of Hopkinton, Mass.; Vice Presidents, Miss Lena A. Chubbuck, New Bedford, Mass., Alice C. Earle, Newport, R. I., Miss Marcia E. Smith, Swanton, Vt., J. B. Underwood, Meriden, Conn.; Secretary and Treasurer, Albert B. Comey, South Framingham, Mass. Plans were suggested looking to the social and other interests of the New England members; said plans to be perfected as soon as the details can be arranged by the executive committee. It is earnestly desired that all persons in the New England States belonging to class '85 will send their name and address to the Secretary. The President cordially solicits correspondence from members of the class upon matters pertaining to its interests.

From the Silver Creek, N. J., *Local* we learn that the meeting for re-organization of the C. L. S. C. has been held, and that on October 8 the first regular meeting took place. Several new members have joined the circle.

At Spring Mills, N. J., though several members have moved from the village, and a few have dropped the course, they report a prospect of doubling their numbers.

A circle of eleven members is reported at Greencastle, Pa.

Osceola, Iowa, has a circle of seventeen members, class of '87.

Some one inquires for a copy of "the rules of the C. L. S. C. to guide in their meetings." There are no rules to guide in the meetings of the local circles. The wide diversity of circumstances under which they exist would make a fixed organization impracticable. What would fit the great circles of Troy, N. Y., and Pittsburgh, Pa., would be of little use to the small circle of the village. The many plans and outlines of work in this department are presented especially to guide new circles to the plan best suited to their needs.

Montana has sent us reports of several energetic circles; the one at Bozeman, of fifteen members, is the last reported.

A circle has been organized at Hood River, Oregon.

The Summer Assembly at Monteagle, Tenn., did some excellent work in the interest of the C. L. S. C. Many circles are being formed as a result of the efforts made there to spread information concerning the methods and object of the organization.

One zealous C. L. S. C. worker writes us that while traveling through the west in search of health she has succeeded in making many think about the course, and has persuaded ten to enroll for '84. It is such individual effort that extends the boundaries of our work.

At Mountain Lake Park, Md., Assembly there was formed last summer a very interesting circle. The members are widely scattered. They come from West Virginia, Maryland and Pennsylvania, but have formed the "Mt. Lake Park C. L. S. C.," which they are keeping up while belonging to the local circles at their homes. There are some forty-three members.

As an example of how the attention of your community may be drawn to the C. L. S. C., we quote the following from the Petersburg Va., *Mail*: "Everybody has heard of Chautauqua, and the readers of *The Mail* have enjoyed several excellent papers concerning that institution from the pen of Mrs. C. D. Tinsley, of this city, who spent the summer there. But there are many people who do not know that the C. L. S. C. is spreading out its branches in all directions and offering very fine advantages to people who desire to undertake a systematic course of reading. The course extends over a period of four years, and embraces religious, scientific, and general literature of a substantial character. The books are cheap, and it is said that one may cover the whole course by reading for forty minutes each day. At the end of the fourth year, if the student has gone over the ground, a diploma is given, bearing the seal of the C. L. S. C. A number of ladies and gentlemen of this city have handed in their names. The writer is favorably impressed with what he has seen of it, and cheerfully commends it to the public. All information required may be had of Mr. C. D. Tinsley, of this city."

A member from Canada writes: "As one of the class of '84—the 'Irrepressibles'—and having caught the inspiration at Chautauqua, I can hardly write or say anything strong enough to express my admiration of the movement. I wish the officers could do something for Palestine. When visiting it a year ago I induced my dragoman, Herbert C. Clark, of Joppa, to subscribe then and there for *THE CHAUTAUQUAN*, as we were sitting on the ruins of the old wall of Mount Zion, above the valley of Hinnom. Mr. Clark writes me that he enjoys it exceedingly. I was much of the time for ten days with Dr. Selah Merrill, the U. S. Consul, and his lady, who worthily represents the women of America. There are many fine people speaking the English language in Jerusalem and other points, who are cut off from many of the advantages of our Christian civilization. Nothing prospers under the administration of the stupid Turk, and literature especially is discouraged. I believe the C. L. S. C. is just what these good people need."

LOCAL CIRCLES.

Vermont (West Brattleboro).—For the past three years, there have been at West Brattleboro, Vt., informal gatherings of from eight to twelve members of the C. L. S. C., who called themselves a "circle." But until this year there has been no formal organization. At the meetings subjects were taken up in the way decided upon at the previous meeting. These meetings were found to be of much profit and interest to ourselves. As we learned to know and appreciate the "Chautauqua Idea," we began to see growth could not be expected without organization. Accordingly a meeting was called for the evening of September 20, to which all were invited, whether they proposed to join or not. At this meeting the aims and methods of the C. L. S. C. were fully discussed, and an organization was effected under the name of the "Vincent Circle," with a president and secretary. There was also a committee for program chosen, to serve for two months. It was decided to hold meetings once in two weeks, at houses of the members. We are happy to say that we start upon our new year with a membership of thirty-nine, eighteen of whom are regular members, representing classes '84, '86 and '87. Nor is this all the gain. Another circle has been organized, under the name of "Pansy." This circle is composed wholly of new members, who thought they could work to better advantage separately. It has twenty-two members. No doubt the secretary will report to you, as the circle is very wide-awake, and means to profit by the experience of the '84s. It has been thought best to devote the time at the meetings during October and November to Grecian history, as that is the principal subject for study during those two months. The following was the program for the first meeting, October 4. The second meeting was similar in character :

1. Responsive Reading from "Assembly Hymnal."
2. C. L. S. C. Song No. 6, from "Assembly Hymnal."
3. Report of Secretary.
4. Introduction of the subject of "Grecian History," by Prof. H. H. Shaw.
5. Paper on "The Advantages of the Study of Grecian History."
6. Instrumental Music.
7. Reading of Selections pertaining to Greece, from the Second Canto of "Childe Harold."
8. Blackboard Drill on "Outlines of Grecian History," by Rev. C. H. Merrill.
9. Question Box, Questions to be answered at next meeting.
10. C. L. S. C. Song No. 19.
11. Closing Prayer.

After the regular exercises, which began at 7:30, closing at 9, an hour was spent in a social way.

Massachusetts (Lawrence).—Immediately after the Assembly at Framingham, a meeting was called in the interests of the Circle in one of our city churches, at which its purpose and method of working were fully explained. Two circles were already in existence, and with these as a basis we put in some hard work during the month of September, securing to date forty-two new members, with more to come. Two additional circles have been formed, so that we now have four, with a total membership of about one hundred. October 1, Opening Day, was duly observed by a union Round-Table of all the circles, and a large number of invited friends. A program consisting of music and readings was given, all appropriate to the occasion. We have engaged Prof. W. C. Richards for a course of lectures in November, and shall have others from time to time through the winter. We have also arranged for a monthly union meeting, each local circle in turn conducting the exercises for the evening.

Massachusetts (Franklin).—As the Bryant Bell at Chautauqua rang out its call to study on October 1, the members of our local circle assembled to celebrate the first anniversary of their existence as a local circle. Complimentary tickets were issued to their friends, and at the hour of opening the chapel was

filled, the audience numbering not far from five hundred. Promptly on the hour, the new members of Class of '87 (the Pansy class) marched into the room, and taking position in open ranks allowed the Class of '86 to pass through; they taking position on the right, opened ranks, and allowed the president of the circle and the speaker of the evening to pass through, receiving as a greeting the Chautauqua salute. The program consisted of instrumental music, singing of selections from Chautauqua Songs, an address of greeting from the president, Rev. G. E. Lovejoy, the commencement address by Rev. A. E. Winship, of Boston, and the recital of the anniversary poem by Miss Laura Pond. The whole affair was a helpful and enjoyable opening of the Chautauqua work for 1883 and 1884. The circle starts upon its work with increased membership and enthusiasm, and one and all are ready to say God bless the originator of the C. L. S. C., and God speed the work in the days to come!

Connecticut (Meriden).—The Meriden branch of the C. L. S. C., held Opening Day exercises; nearly every member was present, together with a few invited guests, mostly those who have especially assisted them in their work during the past three years. The exercises were opened by the circle singing from Chautauqua Songs a song of welcome, after which an address of introduction of the several classes to the guests and a synopsis of the work of the Circle, was delivered by the president, who also took occasion to speak encouragingly to each class, and referred to their several colors and what they symbolized. At the close of the address a prayer of thanksgiving was offered, when the company sat down to a banquet of good things. After supper several toasts were offered and responded to, and several testimonials of interest in the success of the organization offered. The C. L. S. C. feel ~~justly~~ proud of their success, and all who have taken time to examine into its aim and the results accomplished, commend them highly.

Connecticut (Hartford).—Within a few days a general interest has been manifested with regard to a C. L. S. C. circle in Hartford—more than fifty having expressed their desire to become members of the Class of '87. Last year, however, Hartford had but a few Chautauqua readers. Among them was a little circle of five young ladies not long out of school. They found the Chautauqua course just what they needed to give form and direction to their studies, and they sat down to the table of good things spread before them as to a mental banquet. A severe bereavement met the circle in the loss of one of their members, a young lady who had been an eager student and whose enthusiasm had done much to help the circle. By her suggestion Greek had been introduced into the course, and the Iliad was being read in connection with the Greek literature. At the last meeting before her death when it was proposed to omit some of the less interesting portions, she said, earnestly: "Don't let us skip any. Let us do our duty." The shock of her death was such that at first it seemed that they could not go on with their work, but the words of their departed friend came back to them with peculiar meaning: "Let us do our duty," and with chastened hearts they took up their work again. They did not find the course too laborious, but were able to add to it the White Seal course and some valuable supplementary reading upon the topics in question. Now, with undiminished interest, they are ready to go on with the second year, hoping that a large band will be ready to accompany them.

New York (Johnstown).—A meeting for the reorganization of Johnstown C. L. S. C. was held September 26, 1883. The names of fifteen new members were enrolled; so we launch our little craft of twenty-two members, with a prospect of taking an occasional recruit as we journey on. We have decided to meet every alternate week. At our next meeting, October 10, we read an outline on Greek History, Vol. ii., Part vii., a paper on American literature, and selections from THE CHAUTAUQUAN.

Pennsylvania (Erie).—The officers and members of the Erie local circle of the C. L. S. C. presented a very elaborate program at its opening session Monday evening, October 8, at the Y. M. C. A. Hall in this city. The hall was densely crowded, and the interest steadily increased to the close. The organization was completed, and its roll bids fair, this season, to be seventy-five strong.

Delaware (Wilmington).—Through the zealous efforts of the pastor of Asbury M. E. Church, the Asbury local circle was organized during September last. It has about thirty members. Among the members is one graduate of the class of '83. Considerable interest in the course has been aroused through the city, and there are more persons to join.

District of Columbia (Washington).—A meeting of the Banner Circle was held September 17 for reorganization and general talk concerning the work for 1883-84. Quite a large number of our members of last year attended, and from the number of applicants for admission, it seems that we will be compelled to abandon our idea of meeting from house to house of the several members and meet at the church. It is exceedingly gratifying to note the continued interest in the work. Our meetings are held every Monday night. The pastor of one of the churches in another section of our city, attended our last meeting, in order that he might learn enough about the C. L. S. C. to organize a circle among many of his members, who seem anxious to join. We spent many pleasant and instructive evenings last year over our work, and hope to realize as much benefit from the studies of this year. Knowing of the benefits of the C. L. S. C. we are always glad to help others to join. One of our members has been influenced, through last year's work, to attend college.

Ohio (Cincinnati).—The reception to the Class of 1883, of Cincinnati and vicinity, took place on Friday evening, September 28. The spacious parlors where the reunion was held were fragrant with flowers. A beautiful piece of crayon work—"Welcome, 1883," with C. L. S. C. monogram—prepared by the superintendent of penmanship of Cincinnati public schools, together with a fine portrait of Dr. Vincent, held conspicuous places. The following was the program:

Piano solo—Miss Clara Looker.
Address of welcome to the Class of 1883—Mr. John G. O'Connell.
Class song of 1882.
Toast—"The Class of 1882." Response by Mrs. M. J. Pyle.
Class song of 1883.
Toast—"The Class of 1883." Response by Mr. Clifford Lakeman.
Vocal solo—"The Flower Girl." Miss Clara Looker.
Toast—"The Cincinnati Circles." Response by Miss Bessie Hicks.
Song—"Join O Friends in a Memory Song."
Toast—"Chautauqua." Response by Mr. M. S. Turrell.
Song—"C. L. S. C. Commencement Carol."
Toast—"Our Chancellor, Dr. J. H. Vincent." Response by Miss Harriet Wilson.
Song—"Sing Psalms over the Past."

Letters of regret were then read from unavoidable absentees. Time and space will only permit of the publication of the following letter, which is an embodiment of the sentiment contained in the others:

HOT SPRINGS, ARK., September 24, 1883.

Rev. J. G. O'Connell, President C. L. S. C. Alumni Association of Cincinnati, Ohio:—Please accept my thanks for your very kind invitation to attend the C. L. S. C. reception, Friday evening, September 28. The intervening 700 miles will prevent. But does not the Chancellor of the Out-of-Doors University say that, "When the bell at Chautauqua rings on memorial days, all true Chautauquans hear its echo?" And as this same Chancellor teaches so diligently the superiority of mind over matter, why may I not apply this teaching to my own case and say to you that I will be with you in some sort of soul-telephonic manner, and hear your speeches and join in your songs, and enjoy with you the feast of reason and the flow of soul?

I am sorry I said I couldn't go. I think you may expect me. I read

most carefully the report of Commencement Day, and welcomed (in my heart) all the '83s.

A popular writer in a most popular magazine says: "There are in this life three stages of existence. The first, when we believe every thing is white. The second, when one is sure every thing is black; the third, when one knows that the majority of things are simply gray."

Members of the C. L. S. C. have gone a step further than that. To us, all the world has a golden hue. How can one fully understand the meaning of the terms, "communion of Saints," and "brotherly kindness," unless he has spent a season at Chautauqua as a student, in full sympathy with the great work being done there? What grand opportunities are there afforded for growth and symmetrical development of character.

Please tell your Alumni Association how glad I am to be counted one of its members. I thank you again for your kind remembrance of me.

Wishing you a most joyous reunion, and uniting with you in warmest love for our Alma Mater, I am yours sincerely,

HATTIE N. YOUNG.

The officers were elected for the coming year, and after a handsome collation bountifully served, the society parted for the evening, filled with additional enthusiasm for the success of their Alma Mater. President, Mr. John G. O'Connell; Vice Presidents, Mr. M. S. Turrell, Mrs. M. J. Pyle, Miss Mary E. Dunaway; Corresponding Secretary, Mr. Clifford Lakeman; Recording Secretary, Miss Julia Kolbe; Treasurer, Miss Selina Wood.

Illinois (Mattoon).—This is the first year of the C. L. S. C. of Mattoon. We organized the last of September, and have an enthusiastic membership of over twenty. We take the lessons as given in THE CHAUTAUQUAN, sometimes assigning the work to individuals, and again we have general recitations. During the winter we had an afternoon with Longfellow; also a lecture upon the History of Greece, and one upon the Sun, with diagrams. Most of us have completed the work for the year, and have written the memoranda. Our meetings have been both profitable and interesting.

Iowa (Anamosa).—Our C. L. S. C. circle was organized in January, 1883, with a membership of nine ladies, all of whom have taken up the four years' course of study. The order of exercises varies somewhat, but is always exceedingly interesting, each study receiving due investigation and research. Generally, however, our president assigns the different subjects to the members on the preceding meeting, thus giving each leader time to prepare questions which will bring out all the points of interest in the lesson. Amid crowding duties we are glad to note in our membership an increasing enthusiasm over the C. L. S. C. work.

Iowa (Quasqueton).—We are a struggling little company of two regular members of the C. L. S. C. We have not been lacking in interest ourselves, and are heartily in sympathy with the C. L. S. C.; think it is a grand, good thing.

Missouri (Kansas City).—The Kansas City local circle was reorganized on September 25, and was ready to begin work promptly the first week in October. We have at present forty-four members. Our circle has propagated the Chautauqua Idea, and sent off branches until now there are at least six circles in the city, and about three hundred of our citizens are reading the course.

Missouri (Independence).—A local circle was organized here in September with forty-seven regular members. We have a president, vice president, secretary, treasurer, and board of managers. We meet every Friday evening, and thus far have followed the conversational plan. All are interested, and the Chautauqua enthusiasm has the true ring. Already the '87s are looking forward to the day when they will pass through the Arches.

C. L. S. C. ROUND-TABLE.*

DR. VINCENT: What are the advantages of the C. L. S. C.? What are the advantages to our homes?

A VOICE: Unity in the family, in study and spirit.

A VOICE: System of reading at home.

A VOICE: It brings good literature into the house.

A VOICE: It trains intelligent citizens in the house.

A VOICE: It saves time that would be otherwise wasted.

A VOICE: It gives pleasant subjects of thought while we are about our daily work.

A VOICE: It promotes conversation.

A VOICE: It leads us into new lines of work.

A VOICE: It makes us more attractive to each other.

A VOICE: It keeps husbands at home in the evening. [Laughter.]

MR. MARTIN: It keeps wives home in the evening.

A VOICE: It crowds out unprofitable occupation.

A VOICE: It leads to farther investigation.

A VOICE: It cultivates the conversational powers.

DR. VINCENT: It not merely brings subjects of conversation, it brings the power of conversation.

A VOICE: It makes the Southern people love the Northern people.

A VOICE: It lifts the home up a little higher.

A VOICE: It crowds out gossip.

A VOICE: It cultivates a missionary spirit.

DR. VINCENT: In what respect?

A VOICE: In getting people into the circle and into all kinds of work.

A VOICE: A lady says it makes the evening hearth exceedingly pleasant.

A VOICE: It inspires us to want to help others.

A VOICE: It has in one instance made a Christian of an Infidel.

A VOICE: In more than one instance.

A VOICE: There is a book in the course that will do that every time it is attentively read.

DR. VINCENT: What is that?

A VOICE: "The Philosophy of the Plan of Salvation."

A VOICE: And the "Tongue of Fire."

A VOICE: And "The Outline Study of Man" is a wonderful book.

A VOICE: It helps fathers and mothers to grow up with their children.

A VOICE: It helps them cultivate their memory.

A VOICE: I found that I could remember dates much better than before.

REV. W. D. BRIDGE: It brings the old into sympathy with the young.

A VOICE: It gives even old men books they would not have read.

A VOICE: It creates a spirit of union among all kinds of people that belong to it.

A VOICE: It brings the grown people into sympathy with the public school and its work.

A VOICE: It makes us better Christians and workers in the church.

A VOICE: It was suggested a moment ago that it brings the older people into sympathy with the young: I think it brings the young people into sympathy with the old.

A VOICE: It increases the respect of the young for the old also.

A VOICE: It teaches old people to become younger.

A VOICE: It makes old people wish that the thing had been thought of earlier.

A VOICE: It brings us to Chautauqua.

DR. VINCENT: That is a great thing for Chautauqua as well as for us.

A VOICE: It teaches us never to be discouraged.

A VOICE: It teaches us the spirit of propriety.

A VOICE: The first of the Chautauqua mottoes has been noticed; the other two should come in for their share.

DR. VINCENT: The other two mottoes should be recognized. It helps us to "keep our Heavenly Father in the midst."

A VOICE: It shows in the class of '82 the proof of the third motto, "Never be discouraged."

A VOICE: It teaches us to "look up, and not down."

DR. VINCENT: To "look forward and not backward," to "look out and not in," and "to lend a hand."

A VOICE: It leads to an investigation of science by people who had never thought of it before.

MR. INGHAM: It teaches all classes to find a book store.

DR. VINCENT: Brother Ingham is in the book trade. [Laughter.]

A VOICE: It teaches people that no one is too old to study.

A VOICE: It gives a higher idea of the responsibility of life.

A VOICE: It makes the bookseller keep good books. [Applause.]

DR. VINCENT: It makes the bookseller keep the books at a lower figure.

A VOICE: It develops the habit of systematic thought and work.

A VOICE: It discovers people to themselves, showing themselves their natural bent and power.

A VOICE: It breaks down the deep seated denominational prejudices.

DR. VINCENT: Without in the slightest degree diminishing our loyalty to them.

A VOICE: It fits the mind for its eternal mission and home.

A VOICE: It makes one see what a wonderful thing a book is.

A VOICE: It puts the divine idea into all the study: "We study the words and works of God," and this promotes unity of scientific and religious pursuits.

A VOICE: It selects a course of reading that we would not ourselves select.

A VOICE: It teaches us the value of time.

A VOICE: It teaches us to recognize God in everything.

A VOICE: It furnishes a good channel for the expenditure of money in connection with young people.

DR. VINCENT: We ought to say in connection with that, it builds up an individual library that acquires an individual preciousness; when a man looks at it he is rich, for he owns books bought himself. The square yards of books are not worth much. The books that are mine are worth much to me.

A VOICE: It makes it plain that the world is going forward and not back.

A VOICE: It helps the world to go forward, and helps others to acquire knowledge.

A VOICE: It gives us a hint as to the powers and possibilities of the mind.

A VOICE: It teaches me how very little I know myself.

A VOICE: I think it teaches old and young to appreciate art in its different forms.

DR. VINCENT: It enables people to distinguish between good preaching and poor preaching.

A VOICE: It teaches that faithful labor, though in a very limited degree, will be rewarded here and hereafter.

A VOICE: And that it will accomplish a great deal of good in addition to the reward.

A VOICE: It awakens latent energies in the mind.

A VOICE: It makes the common people better critics.

DR. VINCENT: It makes what they would call where caste prevails "common people" better critics. We have no common people in this country. We are all kings.

A VOICE: It makes us understand better the Chautauqua Idea.

*From the record of '82. Held in the Hall of Philosophy in August, 1882, at 5 p. m. [This report had been overlooked, and as it contains much that will be interesting, is here published.]

A VOICE: It makes us patient in weakness and suffering.

A VOICE: It helps us bear the burdens of life.

DR. VINCENT: In many places there is no social enjoyment for those who do not dance. The C. L. S. C. gives us congenial society. I have known many people where the habit of dancing and card playing prevailed, to justify these indulgencies on the ground that there was nothing else to do. In a few such places the C. L. S. C. has turned the dance and the card table out of doors. Of course some of you do not look at that matter as I do. There may be some of you who dance or allow your children to attend dancing school, and some of you allow your children to play cards. I have avoided dogmatism on all subjects where the Word of God does not come in as the final authority. I never like to dogmatize about these things. But I do believe that such is the condition of society to-day, and such are the unseen perils of the day—perils always present—that the family that can enjoy itself thoroughly in an intellectual way, so as not to create a taste for the stimulating power of the dance and the card table and of the theater is a safer, and in the long run, a happier family than the family otherwise controlled by so-called worldly tastes. [Applause.] It becomes us to be very free from dogmatism about these things, because we do not want to lay down laws that have not been laid down for us; but if we can, let us substitute the influences of the C. L. S. C. for these things.

WRITTEN PAPER: The C. L. S. C. gives new hope and courage to those who have thought that the days for personal improvement had gone by.

DR. VINCENT: Dr. Wilkinson, in his address the other day, made reference to the fact that I myself had never enjoyed college opportunities. I did enjoy the very best academic opportunities up to the time that I should have entered college, but circumstances, which seemed very much like Providence, interposed at that crisis in my life, where the question was settled by three contingencies. I suffered from a bronchial affection, and my friends regarded me in great peril physically. I submitted three questions to three men after serious thought and earnest prayer, and resolved to be governed by the decision of the three men if they should decide in the same line. To one, an able scholar and a most efficient preacher, and a man occupying a high position in the church, I submitted the question of my intellectual fitness, and gave him a long account of my intellectual history. To another man, my father, I submitted the financial part of the business. That was a question that he alone could settle. To a distinguished physician, one of the ablest in New York City, I submitted the question of my physical health. Now, said I, if these three men combine in their decision, I shall consider the question settled in that way. If they differ, I shall consider it still open. The decision of all three was quite in a given line, and I entered very soon into the active ministry.

The fact that I lacked the *prestige* of the college was humiliating to me to the last degree. It made me morbid for years. I was too honest to impose on people, and therefore too likely to betray myself where no good could come of it, and where there was no necessity of it. But my humiliation led me to do this thing: To turn my theological studies and the preparation of sermons into means of mental discipline; to acquire the habit of laying hold of a subject, and of holding on to it, and persisting in holding on to it until I could master it, so that if I did not have more than a smattering (and I did have a smattering of Greek and Latin and Hebrew to begin with), I would have the discipline of thinking on subjects and of tearing them open on my own account. I tried to do that through all the years of my active ministry.

—I drew up for myself a sort of C. L. S. C. thirty years ago, and took glimpses of all that the boy examines in college, so that the C. L. S. C. of to-day developed out of it, and different as it may be, it is the result of bitter experience and immense effort, so far as I was personally concerned.

I really ought not to have mentioned these things to you. I have never done so anywhere except to a limited circle of friends. When I watch boys in college, their pleasures and struggles; when I look at the buildings, at the bronze statue of the first president of Yale, the libraries, the art department, the scientific department; when I hear that old bell ring from day to day, when I look on the *campus* and see the boys marching or lounging, singing the college songs; when I see them striving for preëminence in the athletic arena; when I remember that certain prerogatives depend upon victory on this side or the other; when I see old men who were students fifty or sixty years ago, the oldest that are left, and see the joy that comes from the inspiration of such memories, then I see that it is a great thing to be able to give old people and every-day people a touch of the joy and hope and memory that colleges alone can give, and no one unless identified with such an institution can feel.

It is for that purpose that we have the "Hall in the Grove," and the "Arches," the "Memorial Days," the "Badges," the "Diplomas," etc. Privileges heretofore limited to college life are thus and now guaranteed to the old and the young. This is another benefit that comes from the C. L. S. C. [Applause.] I should have taken a shorter time to tell it, but I could not.

WRITTEN PAPER: In accordance with your request for the members of the Circle to remember each other at the throne of grace each Sabbath afternoon, would it not be well to have a set hour, say five o'clock, Sunday afternoon?

DR. VINCENT: The suggestion is a good one. We will call five o'clock Sunday afternoon "Our Sacred Hour." Mr. Bridge, make an item for the columns of THE CHAUTAUQUAN, that it may reach all the members of the Circle.

As I said the other night, we are not all of the same way of thinking, but we may all think upward, and whatever the degree of our thought and the kind of our faith, if the look be upward, there will be an uplift. If with sincere desire we pray for others and seek God's glory, he will lead us into all truth. Let us appoint with your approval five o'clock Sabbath afternoon for the uplook in order to uplift. Those who approve lift your hands.

My friends, while the formal worship—the going aside and kneeling down, and observing the form of worship—is very useful, the idea of prayer is not limited to the place or particular mode, or to the words you speak. Prayer is sometimes the mightiest that leaps without words out of the inmost heart to the highest heaven. Let us think a prayer wherever we may be. Sometimes when people are too busy with their hands and under the pressure of every-day labor to retire, and have not words or place for the specific act of prayer, the uplift of the soul, the upreach, is prayer that brings down abundant blessings. Let it be so with us. Let us not be bound too much by times and circumstances and words. Let us have the heart, and let forms and words come as they will, and let us not neglect times and forms and words.

QUESTIONS AND ANSWERS.

ONE HUNDRED QUESTIONS AND ANSWERS ON "EASY LESSONS IN VEGETABLE BIOLOGY."

By A. M. MARTIN, GENERAL SECRETARY C. L. S. C.

1. Q. How is the word Biology made up, and what does it mean? A. It is made up of two Greek words—*bios*, life, and *logos*, a discourse. It means the study of living things.

2. Q. What does Biology include in its survey? A. Both animals and vegetables, and considers their forms and peculiarities, the parts of which they are composed, their relations to each other, and the uses which they serve.

3. Q. What are the subjects of Physics and Chemistry? A. The general forces of nature and the changes in non-living matter.

4. Q. What is the teaching of the Bible and of all the religions of mankind, the belief of the most eminent philosophers, the doctrine held by the early Christian fathers, and maintained by the majority of scientific and unscientific men as to the difference between a living body and the same body after death? A. That it arises from the union of matter and spirit.

5. Q. What is it that entitles any thing to be called a living being? A. The presence of little particles of living matter scattered through it.

6. Q. What does this living matter look like when seen through the microscope? A. Like a little bit of jelly or albumen. It is generally transparent; is neither quite solid or fluid.

7. Q. What is it called? A. It is often called protoplasm, or first formation. It is also called by the better term bioplasm, or living formation.

8. Q. What is said as to the resemblance of the particles of bioplasm to one another, no matter where they belong? A. They always look alike. There is no difference under the microscope between the bioplasm of a blade of grass or a whale, or an oak, a rose, a dog, or a man.

9. Q. What does chemical examination show as to all living matter? A. That it is composed of the same elementary materials. Oxygen, hydrogen, carbon, and nitrogen enter into the construction of every piece of bioplasm.

10. Q. In what three different states do we recognize matter in every bioplast, or living particle? A. Matter not yet alive, but about to become so, called pabulum, or nutriment. Living matter in the strictest sense, or bioplasm. Formed material, or matter which was alive, but is so no longer.

11. Q. What peculiarity has living matter as to motion? A. All bioplasm has spontaneous motion. Non-living matter has inertia.

12. Q. What are the three kinds of motion of bioplasm? A. Inherent motions of individual particles among themselves. Constant change of shape. Wandering movements.

13. Q. What is the peculiarity of living matter as to the power of nutrition and growth? A. The non-living increases in size by external additions; but bioplasm selects appropriate material from its food, or pabulum, changes the chemical relations of this material, and appropriates it to its own structure in such a way that it grows from within.

14. Q. What is the peculiarity of bioplasm as to reproduction? A. Bioplasm can generate or reproduce its own kind of living matter.

15. Q. What power has a living thing to preserve its own identity? A. A living being preserves its identity amid all the material changes which take place.

16. Q. In the grouping together of living things according to their real relationships, what do types represent? A. General plans of structure.

17. Q. How are classes formed? A. By the special modification of a type.

18. Q. What are orders? A. They are groups of the same class related by a common structure.

19. Q. What is a family or genus? A. A still smaller group having generally the same essential structure.

20. Q. What is a species? A. It is the smallest group whose structure is constant.

21. Q. What are individuals? A. They are the units of organic life, forming a complete animated existence.

22. Q. What are peculiarities of races or breeds called? A. Varieties.

23. Q. How are vegetables and animals distinguished from each other? A. By the term kingdom, and the types in each kingdom are called sub-kingdoms.

24. Q. Under what five types or plans of structure can all the multitude of plants which clothe the earth or dwell in the sea be

arranged? A. Protophytes, Thallogens, Acrogens, Endogens and Exogens.

25. Q. What are the elementary masses of bioplasm usually called? A. They are usually called cells, even if they are merely pieces of animated jelly, uninclosed by an outside shell or membrane.

26. Q. What is the principal difference between animals and plants? A. The latter can be nourished by simple mineral or chemical (that is unorganized) matter, while animal nutrition requires material which has been organized, or made part of a living being.

27. Q. What do most vegetable cells produce on the outside? A. A membrane or cell wall, within which the living matter is, as it were, imprisoned.

28. Q. What concentrations of living matter are there within a cell? A. A concentration called a *nucleus*, and sometimes a still further concentration within the nucleus, called *nucleolus*, or little nucleus.

29. Q. Of what substance is the cell wall composed? A. A substance somewhat like starch, called cellulose.

30. Q. When it becomes solid how is it known? A. As woody tissue.

31. Q. How is common wood made up? A. Of a number of these cells arranged side by side.

32. Q. Of what shape may vegetable cells be? A. They may be globular, oval, conical, prismatic, cylindrical, branched, or of any other form.

33. Q. What are some of the varieties of formed material into which the bioplasm within the cell wall may be transformed? A. They may be solid, as coloring matter, starch, crystals, and resin; or fluid, as oil and gum, or solutions of sugar or tannin.

34. Q. What is the most important of these substances called? A. Chlorophyll, the source of the green color of plants.

35. Q. What other product of vegetable cells is even more widely distributed than chlorophyll? A. Starch.

36. Q. How do cells generate? A. By self-multiplication.

37. Q. What are the simplest forms of plant life? A. Those that consist of a single cell.

38. Q. In the higher classes of plants what is the character of the union of cells which forms tissues and organs? A. It is permanent.

39. Q. What are made by the union of cells into groups? A. The woody fibers of plants, and the cellular tissue which makes the softer, fleshy and pithy parts.

40. Q. What has observation shown as to the production of new cells in the highest plants? A. That they are not produced everywhere uniformly, but in particular spots.

41. Q. What terms have been applied to places of this kind? A. Growing-point, and growing or formative layer.

42. Q. Where may growing-points and formative layers be seen? A. Growing-points may be seen in the tips of buds, and formative layers between the wood and bark of trees.

43. Q. What names have been given to the tissue which is here formed by the division and union of cells? A. Formative or generating tissue.

44. Q. What are in direct contrast to the generation tissues? A. The healing tissues, or cork tissues.

45. Q. How are vessels made? A. By the union of several cells, the partition-walls disappearing, while the union continues at the margin.

46. Q. What are bast-tubes or bast-fibers? A. They are long, pointed, thick-walled tubes, commonly united into bundles.

47. Q. To what part of the flower is the term nectaries, or honey-glands, given? A. To any part of a flower which secretes honey or sugary fluids.

48. Q. What is the first independent tissue formed in flowering plants by the union of cells? A. The epidermis or skin.

49. Q. What is each of the pores found among the epidermic cells called? A. A stoma, or mouth.

50. Q. What are hairs? A. They are epidermal structures, composed of one or more cells.

51. Q. What do we find next to the epidermis? A. The cortex, or bark, often composed of cells containing starch or chlorophyll.

52. Q. What is beneath the bark? A. The formative layer or cambium, in which thin-walled cells become transformed into vascular or bast-cells, and thence are changed into permanent cells.

53. Q. What do groups of cells thus formed, united into bundles and penetrating the rest of the tissue, form? A. The fibro-vascular bundles.

54. Q. What are the simpler types of plants that have no fibro-vascular bundles, called? A. Cellular plants.

55. Q. What are the rest termed? A. Vascular plants.

56. Q. Of what does the fundamental tissue generally consist? A. Of thin-walled cells containing starch, although other forms of cells may be present.

57. Q. What is the simplest form of individual plant life? A. A particle of living matter inclosed in a membrane or cell-wall.

58. Q. What are plants of this type of structure called? A. Protophytes.

59. Q. Where are many of these one-celled plants found? A. In the green slime which grows on stones and on boards in damp places.

60. Q. What is one of the simplest forms, often found in rain-water casks, called? A. The protococcus.

61. Q. What are the unicellular plants most interesting to those who study with the microscope? A. Diatoms.

62. Q. In the living state where are diatoms found abundantly? A. In every pond, rivulet, ocean and rock-pool.

63. Q. What do they form in a fossil state? A. Large strata of rock material.

64. Q. What are thallophytes? A. Plants composed of a tissue of cells, or bioplasts, but with no clear distinction of stem, root and leaves.

65. Q. What three classes are included under this type? A. Algæ, or sea-weeds; Lichens, or the dry, leafy, or mossy patches on trees, stones, etc.; and Fungi, or mushrooms, molds, and their allies.

66. Q. Into what three orders have Algæ, or sea-weeds, been divided? A. The red, the olive and the green sea-weeds.

67. Q. How are Fungi regarded by some scientists? A. As neither animal nor vegetable, but forming a sort of third kingdom.

68. Q. What seems to be the principal business of the Fungi? A. The removal of the waste material of both animal and vegetable life.

69. Q. What are Acrogens? A. Plants which grow at the summit only, and not in diameter.

70. Q. What plants do we find in fresh-water ponds and rivers, growing in tangled masses of dull green color that illustrate the manner of growth in the type of Acrogens? A. Stone-worts, consisting of two genera, Chara and Nitella.

71. Q. What are the nodes, and what the internodes in the stone-worts? A. The points on the axis, or stem, from which the branchlets spring, are called nodes, and the intervening parts are internodes.

72. Q. How is each internode formed? A. By the growth and elongation of single cells.

73. Q. How are the branchlets produced? A. By the subdivision of single cells.

74. Q. What other families of plants are examples of Acrogens? A. Ferns and Mosses.

75. Q. What are Endogens? A. Plants whose vessels and woody fibers first grow within the stem. The seed has but a single lobe, or cotyledon.

76. Q. What families of plants are found in the type of Endogens? A. Grasses, Rushes, Lilies, and Palms, with similar families.

77. Q. In the growing plant what part grows from the axis upward, and what part from the axis downward? A. The stem grows from the axis upward, and the root downward.

78. Q. What is the root formed by the downward elongation of the axis called? A. It is called the primary root.

79. Q. What is the stem of a plant? A. That part which bears the leaves, flowers, and fruit.

80. Q. What is the length of life of the stem and roots? A. It may be only a single year, or annual; two years, or biennial; or a number of years, or perennial.

81. Q. What are thorns? A. Undeveloped branches, and many plants which are thorny when wild are not so under cultivation.

82. Q. Of what are leaves constituted? A. Cells, with cavities, fibro-vascular bundles and epidermis.

83. Q. How do the veins in the leaves of Endogens differ from those in the leaves of Exogens? A. They are generally parallel or straight in Endogens, and do not form a network as in Exogens.

84. Q. What are five of the names given to leaves according to their shapes? A. Lanceolate, or narrow and tapering; oblong, or narrow and not tapering; cordate, or heart-shaped; sagittate, or arrow-shaped; and ovate, or egg-shaped.

85. Q. What is the function or use of leaves? A. To expose the juices of the plant to light and air, and thus aid in forming the woody matter of the stem and the various secretions.

86. Q. What constitute a plant's organs of nutrition? A. The root, stem and leaves.

87. Q. What is the flower of a plant? A. It is the organ, or assemblage of organs, for the production of the seed.

88. Q. What are the four whorls in which the parts of a flower are usually arranged called? A. The outer whorl is the calyx, the next the corolla, the third the stamens, and the innermost the pistil.

89. Q. To what is the term fruit applied in botanical language? A. To the mature, perfect pistil, whether dry or succulent.

90. Q. What nutritious grains are classed among the family of Endogens called grasses? A. Wheat, barley, oats, rice and Indian corn.

91. Q. What other families are noted members of the type of Endogens? A. Palms and bananas.

92. Q. What are some of the other families of the type of Endogens? A. The orchid, the lily and the bulrushes.

93. Q. What are Exogens? A. Plants whose woody fibres grow in outer layers. The seed has two lobes, or cotyledons.

94. Q. How many different species are included in this type? A. About seventy thousand.

95. Q. What are Incomplete Exogens? A. Those whose flowers have no corolla. They are of two kinds.

96. Q. What are the first kind? A. Those whose seeds are naked, as in the cone-bearing family, consisting of the fir and spruce tribe, the cypress tribe, and similar plants.

97. Q. What are the second kind? A. Those whose seeds are contained in the ovary, as the amaranth, buckwheat, laurel, nettle, fig, and the catkin-bearing family.

98. Q. What are some of the plants in the next sub-division of the type of Endogens, those whose flowers have both calyx and corolla? A. The honeysuckle, teasel, lobelia, convolvulus, primrose, and labiate and composite families.

99. Q. What are some of the families of plants found in another class of Exogens that also have calyx and corolla, but the corolla has distinct petals, and the stamens are attached to the calyx? A. The umbelliferous, the leguminous, and the cactus families.

100. Q. What are the distinguishing characteristics of the highest class, or the most perfect Exogens? A. The calyx and the corolla are present, the petals are distinct and inserted into the receptacle, and the stamens grow from beneath the ovary.

POPULAR EDUCATION.

CHAUTAUQUA LITERARY AND SCIENTIFIC CIRCLE.

President—Lewis Miller.

Superintendent of Instruction—J. H. Vincent, D.D.

Counselors—Lyman Abbott, D.D.; J. M. Gibson, D.D.; Bishop H. W. Warren, D.D.; W. C. Wilkinson, D.D.

Office Secretary—Miss Kate F. Kimball.

General Secretary—A. M. Martin.

I.—AIM.

This new organization aims to promote habits of reading and study in nature, art, science, and in secular and sacred literature, in connection with the routine of daily life (especially among those whose educational advantages have been limited), so as to secure to them the college student's general outlook upon the world and life, and to develop the habit of close, connected, persistent thinking.

2.—METHODS.

It proposes to encourage individual study in lines and by text-books which shall be indicated; by local circles for mutual help and encouragement in such studies; by summer courses of lectures and "students' sessions" at Chautauqua, and by written reports and examinations.

3.—COURSE OF STUDY.

The course of study prescribed by the C. L. S. C. shall cover a period of four years.

4.—ARRANGEMENT OF CLASSES.

Each year's Course of Study will be considered the "First Year" for new pupils whether it be the first, second, third, or fourth of the four years' course. For example, "the class of 1887," instead of beginning October, 1883, with the same studies which were pursued in 1882-83 by "the class of 1886," will fall in with "the class of '86," and take for their first year the second year's course of the '86 class. The first year for "the class of 1886" will thus in due time become the fourth year for "the class of 1887."

5.—C. L. S. C. COURSE OF READING, 1883-84

I. REQUIRED.

History of Greece.* By Prof. T. T. Timayenis. Vol. 2; parts 7, 8, 10 and 11. Price, \$1.15.

Stories in English History by the Great Historians. Edited by C. E. Bishop, Esq. Price, \$1.

Chautauqua Text-Books.—No. 16, Roman History; No. 24, Canadian History; No. 21, American History; No. 5, Greek History. Price, 10 cents each.

Preparatory Latin Course in English. By Dr. W. C. Wilkinson. Price, \$1.

Chautauqua Text-Books.—No. 23, English Literature. By Prof. J. H. Gilmore. Price, 10 cents.

Primer of American Literature. By C. F. Richardson. Price, 30 cents.

Biographical Stories by Hawthorne. Price, 15 cents.

How to Get Strong and How to Stay So. By W. Blaikie. Price, cloth, 80 cents; paper, 50 cents.

Easy Lessons in Vegetable Biology. By Dr. J. H. Wythe. Price, cloth, 40 cents; paper, 25 cents.

Philosophy of the Plan of Salvation. By J. B. Walker. Price, cloth, \$1; paper, 50 cents.

Chautauqua Text-Books.—No. 18, Christian Evidences; No. 39, Sunday-School Normal Class Work; No. 43, Good Manners; No. 4, English History. Price, 10 cents each.

THE CHAUTAUQUAN, price, \$1.50, in which will be published:

Sunday Readings. Selected by Dr. J. H. Vincent.

Readings in Commercial Law. By Edwin C. Reynolds, Esq.

Readings in Political Economy. By Prof. George M. Steele, D.D.

Readings in French History and Literature. By Dr. J. H. Vincent.

Studies in American History and Literature. By A. M. Martin, Esq.

THE CHAUTAUQUAN will also contain, in the department of Required Readings, brief papers, as follows:

Readings in German History and Literature.

Readings in Roman History.

Readings in American Literature.

Readings about the Arts, Artists, and their Masterpieces.

Readings in Physical Science.

ADDITIONAL READINGS FOR STUDENTS OF THE CLASS OF 1884.

Hints for Home Reading. By Dr. Lyman Abbott. Price, cloth, \$1; boards, 75 cts.

The Hall in the Grove. By Mrs. Alden. (A Story of Chautauqua and the C. L. S. C.) Price, \$1.50.

Outline Study of Man. By Dr. Mark Hopkins. Price, \$1.50.

II. FOR THE WHITE SEAL.

Persons who pursue the "White Seal Course" of each year, in addition to the regular course, will receive at the time of their graduation a white seal for each year, to be attached to the regular diploma.

History of Greece.* By Prof. T. T. Timayenis. Vol. 2. Completed. Price, \$1.15.

Chautauqua Library of English History and Literature. Vol. 2. Price, cloth, 50 cents; paper, 35 cents.

Church History. By Dr. Blackburn. Price, \$2.25.

Bacon's Essays. Price, \$1.25.

III. REQUIRED.—FOR THE WHITE (CRYSTAL) SEAL FOR GRADUATES OF '82 AND '83.

For the benefit of graduates of the C. L. S. C. who, being members of local circles, wish to continue in the same general line of reading as undergraduate members, a White Crystal Seal Course is prepared. This consists mainly of books belonging to the current year's study, but not previously read by the graduates. An additional white seal is also offered to the graduates, the books for which are specified under paragraph 4. Some of these books were in the first four year's course, and are therefore to be re-read. The payment of one dollar at one time entitles a graduate to the White Crystal and White Seals for four years. If only fifty cents is paid, it will be credited for but one year.

THE CHAUTAUQUAN. Required Reading.

History of Greece.* By Prof. T. T. Timayenis. Vol. 2. Completed. Price, \$1.15.

Preparatory Latin Course in English. By Dr. W. C. Wilkinson. Price, \$1.

Credo. By Dr. L. T. Townsend. Price, \$1.

Bacon's Essays. Price, \$1.25.

IV. REQUIRED.—FOR ADDITIONAL WHITE SEAL FOR GRADUATES OF '82 AND '83.

Brief History of Greece. By J. Dorman Steele. Price, 60 cents.

Stories in English History by the Great Historians. Edited by C. E. Bishop. Price, \$1.

Easy Lessons in Vegetable Biology. By Dr. J. H. Wythe. Price, cloth, 40 cents; paper, 25 cents.

Biographical Stories. By Nathaniel Hawthorne. Price, 15 cents.

How to Get Strong and How to Stay So. By W. Blaikie. Price, cloth, 80 cents; paper, 50 cents.

Philosophy of the Plan of Salvation. By J. B. Walker. Price, cloth, \$1; paper, 50 cts.

Primer of American Literature. By C. F. Richardson. Price, 30 cents.

Chautauqua Text-Books, Nos. 4, 5, 16, 18, 21, 23, 39 and 43. Price, each, 10 cents.

*Students of the new class (1887) to be organized this fall, and graduates of the classes of '82 and '83, not having read volume 1 of Timayenis's History of Greece, will not be required to read volume 2, but instead of volume 2, of Timayenis's, will read "Brief History of Greece." Price, paper, 60 cts.

The following is the distribution of the books and readings through the year:

October.

History of Greece.* Vol. 2. By Prof. T. T. Timayenis. Parts 7 and 8.

Chautauqua Text-Books.—No. 5, Greek History. By Dr. J. H. Vincent.

Primer of American Literature. By C. F. Richardson.

Required Readings in THE CHAUTAUQUAN

November.

History of Greece.* Vol. 2. By Prof. T. T. Timayenis. Parts 10 and 11.

Chautauqua Text-Books.—No. 5, Greek History. By Dr. J. H. Vincent.

Required Readings in THE CHAUTAUQUAN

December.

Easy Lessons in Vegetable Biology. By Dr. J. H. Wythe.

Biographical Stories. By Nathaniel Hawthorne.

Chautauqua Text-Books.—No. 24, Canadian History.

Required Readings in THE CHAUTAUQUAN

January.

Philosophy of the Plan of Salvation. By J. B. Walker. 14 chapters.

Chautauqua Text-Books.—No. 18, Christian Evidences. By Dr. J. H. Vincent.

Chautauqua Text-Books.—No. 39, Sunday School Normal Class Work.

Required Readings in THE CHAUTAUQUAN

February.

Philosophy of the Plan of Salvation. By J. B. Walker. Completed.

6.—SPECIAL COURSES.

Members of the C. L. S. C. may take, in addition to the regular course above prescribed, one or more special courses, and pass an examination upon them. Pupils will receive credit and testimonial seals to be appended to the regular diploma, according to the merit of examinations on these supplemental courses.

7.—THE PREPARATORY COURSE.

Persons who are too young, or not sufficiently advanced in their studies to take the regular C. L. S. C. course, may adopt certain preparatory lessons for one or more years.

For circulars of the preparatory course, address Miss K. F. KIMBALL, Plainfield, New Jersey.

8.—INITIATION FEE.

To defray the expenses of correspondence, memoranda, etc., an annual fee of fifty cents is required. This amount should be forwarded to Miss K. F. Kimball, Plainfield, N. J., (by New York or Philadelphia draft, Post-office order on Plainfield, N. J., or the new Postal Note, to be ready about September 1.) Do not send postage-stamps if you can possibly avoid it. Three-cent stamps will not be received.

N. B.—In sending your fee, be sure to state to which class you belong, whether 1884, 1885, 1886, or 1887.

9.—APPLICATION FOR MEMBERSHIP.

Persons desiring to unite with the C. L. S. C. should forward answers to the following questions to Miss K. F. KIMBALL, PLAINFIELD, N. J. The class graduating in 1887 should begin the study of the lessons required October, 1883. They may begin as late as January 1, 1884.

1. Give your name in full.
2. Your post-office address, with county and State.
3. Are you married or single?
4. What is your age? Are you between twenty and thirty, or thirty and forty, or forty and fifty, or fifty and sixty, etc.?
5. If married, how many children living under the age of sixteen years?
6. What is your occupation?
7. With what religious denomination are you connected?
8. Do you, after mature deliberation, resolve, if able, to prosecute the four years' course of study presented by the C. L. S. C.?
9. Do you promise, if practicable, to give an average of four hours a week to the reading and study required by this course?
10. How much more than the time specified do you hope to give to this course of study?

10.—TIME REQUIRED.

An average of forty minutes' reading each week-day will enable the student in nine months to complete the books required for the year. More time than this will probably be spent by many persons, and for their accommodation a special course of reading on the same subjects has been indicated. The habit of thinking steadily upon worthy themes during one's secular toil will lighten labor, brighten life, and develop power.

11.—MEMORANDA.

The annual 'examinations' will be held at the homes of the members, and in writing. Duplicate Memoranda are forwarded, one copy being retained by each student and the other filed out and forwarded to the office at Plainfield, N. J.

12.—ATTENDANCE AT CHAUTAUQUA.

Persons should be present to enjoy the annual meetings at Chautauqua, but attendance there is not necessary to graduation in the C. L. S. C. Persons who have never visited Chautauqua may enjoy the advantages, diploma, and honors of the "Circle."

13.—MISCELLANEOUS.

For the history of the C. L. S. C., an explanation of the LOCAL CIRCLES, the MEMORIAL DAYS to be observed by all true C. L. S. C. members, ST. PAUL'S GROVE at Chautauqua, etc., etc., address (inclose two-cent stamp) Miss K. F. KIMBALL, Plainfield, N. J., who will forward the "Chautauqua Hand-Book, No. 2," sixty-four pages. Blank forms, containing the ten questions given in paragraph 9, will also be sent on application.

14.—CHAUTAUQUA PERIODICALS.

THE CHAUTAUQUAN, organ of the C. L. S. C.; 76 pages; ten numbers; \$1.50 per year. CHAUTAUQUA ASSEMBLY DAILY HERALD, organ of Chautauqua meetings; 8 pages; 48 columns. Daily in August; 10 numbers. Contains the lectures delivered at Chautauqua; \$1 per volume. Both periodicals one year, \$2.50. Address Dr. Theodore L. Flood, Editor and Proprietor, Meadville, Pa.

15.—BOOKS OF THE C. L. S. C.

For all the books address Phillips & Hunt, New York, or Walden & Stowe, Cincinnati or Chicago.

*Students of the new class (1887) to be organized this fall, not having read volume 1 of Timayenis's History of Greece, will not be required to read volume 2, but instead of volume 2, of Timayenis's, will read "Brief History of Greece." Price, paper, 60 cts.

†We ask this question to ascertain the possible future intellectual and moral influence of this "Circle" on your homes.

CHAUTAUQUA NORMAL COURSE.

Season of 1884.

LESSON II.—BIBLE SECTION.

The Bible from God Through Man.

By J. L. HURLBUT, D.D.

The Sunday-school teacher in his work uses one book, and one only. To that one book he appeals as an authority; the doctrines contained in that book he asserts as truth; the moral system of that book he insists upon as the standard for man's obedience. It is therefore necessary to know concerning the Bible:

I. The claims of the Bible believer.

II. The evidences supporting those claims.

I. There are *four claims* made on behalf of the Bible by those who believe in it.

1. *Its Genuineness.* By this we mean that we possess the book substantially as it was written. Not that we have an absolutely perfect text, or that the translations represent precisely the original, or that we know just when or by whom all the books were written, but that the work has come into our possession without serious mutilation or interpolation. We can accept it as the Bible.

2. *Its Authenticity.* By this we mean that the book contains the truth. Its records are trustworthy history; its reports of discourses or parables or conversations give the substance of their thoughts; its statements upon every subject can be depended upon as honest and truthful.

3. *Its Inspiration.* By this we mean simply that this book came from God. "Divine inspiration we understand to be an extraordinary divine agency upon teachers while giving instruction, whether oral or written, by which they were taught what and how they should write or speak." (Dr. Knapp, quoted by McClintock and Strong.)

4. *Its Authority.* By this we mean that the Bible contains God's law, and was given to us as the standard in life. It contains "the only rule, and the sufficient rule, for our faith and practice." No doctrine is to be accepted unless it is in accordance with the teachings of the Bible, and no law is binding which conflicts with the higher law of the Scriptures.

II. *The Evidences Supporting these Claims.* It is not necessary to present the proofs of each claim apart from the others. Those attesting the genuineness of the Bible will be given with Lesson iv, "The Canon of Scripture;" but the other claims are so linked together that the proofs of one are the proofs of all. If the Bible can be proven *true*, its truth is of such a nature as to show a divine original; and if it proceeds from God, it comes as God's law. Hence we present together the *Ten Evidences* of its Authenticity, Inspiration and Authority.

1. *Its Adaptation to Human Need.* (1) We start with the proposition that *there is a God*; a person who governs the universe; not a mere personification of law or force, but a spiritual existence. (2) *God has a Law.* If God has no law for man, then for man there is practically no God. (3) *We have a right to know that law.* What would be thought of a law-maker with absolute power, who concealed his decrees, yet expected his subjects to obey them, and punished them for disobedience? (4) *We find just such a law as we need in the Bible, and we find it nowhere else, for it is not stamped into our consciousness, nor is it written in nature.* (5) We conclude then that *the Bible contains the Divine Revelation.*

2. *Its General Acceptance.* The common consent of intelligent society has accredited this book as authentic and divine. (1) We find an *early acceptance* among those best acquainted with its facts, and nearest to them; the Old Testament regarded as divine among the Jews; the New Testament among the Christians. (2) We find a *continuous acceptance* through all

the centuries since; at no time the chain of belief being broken. (3) We find a *present acceptance* now; in this age of searching investigation, when nothing is accepted on ground of tradition only, the Bible has more readers, more students, more believers in the intelligent classes than at any previous period of its history.

3. *Its Characteristics.* The Bible contains four traits which, taken together, distinguish it from all other books. (1) *Its Variety.* Written at intervals through 1,600 years, by more than thirty authors, in different lands and different languages, it contains history, poetry, genealogy, biography, ethics, epistles, doctrine, and many other classes of composition. (2) *Its Harmony.* Underneath its variety of the surface there is a harmony, so that its statements and its principles are nowhere discordant. Contrast with this the discords of scientists. Could we place on one shelf sixty-six books on astronomy, written during sixteen centuries, by thirty writers, and find them harmonious? (3) *Its Unity.* Amid all the different subjects of the Bible there is one unifying purpose. It presents as its theme *Redemption*, and every chapter in every book falls into line in relation to that central thought. (4) *Its Progressiveness.* There is a steady development of truth in Scripture, a growing light through its centuries. We see the revelation beginning with Adam, taking a step upward with Noah, another with Abraham, again with Jacob, and so mounting higher in turn with Moses, Samuel, David, Isaiah, Malachi, Peter and Paul, each on a loftier platform of spiritual knowledge than the age before him, until John crowns the pyramid of truth in his gospel and the Apocalypse. Not all the earth can show another book besides the Bible with all these four traits, which show the work divine.

4. *The Harmony of its Relations.* The statements of the Bible come into relation with facts ascertained in various departments of knowledge; yet in none of these do we find contradiction, in all an ever increasing harmony as our knowledge grows. (1) *With Localities.* The Bible names more than two thousand places in the ancient world; lands, rivers, seas, mountains, towns, villages, brooks, etc., yet not a single locality has been placed wrongly by the Scripture. (2) *With Existing Institutions.* We find in the world such bodies of people as the Jews, the Samaritans, the Christian church; such services as the passover, baptism, the Lord's Supper, etc. Take away the Bible and none of these can be accounted for; open the Bible, their origin is plain. (3) *With Historical Monuments.* During the present century thousands of ancient inscriptions have been brought forth and deciphered, and the history of great empires has been written, bearing close relation to the history of the Bible. But not a line of the Bible annals has been discredited by these explorations, and many Bible statements have been placed in clearer light. (4) *With Science.* Though "the conflict of science and the Bible" has been often referred to, yet the testimony of the best scientists is that the opening chapters of Genesis are in substantial and growing accord with geology; that the tenth chapter of Genesis tallies with the latest conclusions of comparative philology; and that modern astronomy furnishes the best illustrations of the attributes of God as revealed in Scripture.

5. *The Fulfillment of its Prophecies.*—It is very evident that no man, unaided by Divine wisdom, can know the future and make prediction of coming events. Yet there is a book containing many prophecies, which have been fulfilled to the letter. (1) There are *predictions concerning places*, as Babylon, Nineveh, Jerusalem, Tyre, Egypt, all differing in their statements, yet all brought to pass. (2) There is a series of predictions concerning Christ, beginning in Eden and extending through the Old Testament, growing in definiteness as the hour of fulfillment drew near, and all accomplished. Thus the New Testament and the Old mutually prove each other.

6. *The Person of Christ.*—We find in the gospels four accounts, by different writers, of one Person. They tell us that

he was at once God and man; that he grew up in a country village, yet surpassed all the wisdom of the philosophers; that he could create food, yet suffered hunger; that he could raise the dead, yet submitted to be tortured and crucified; that he was free from worldly ambition, yet became the founder of the greatest kingdom earth has seen. The life, the character, the personality, is so unique and original that no one could have invented it. Hence the writers of the gospels must have drawn their sketch from the life.

7. *The Candor of its Writers.*—The authors of these documents write like honest men, telling their story plainly, without partisan bias. They relate the sins of their heroes, Abraham's deception, Jacob's double-dealing, Moses' anger, David's crime, Peter's denial, Paul's quarrel with Barnabas. Their tone of sincerity shows the truthfulness of the narration.

8. *The Elevation of its Teachings.*—Here is a book, written in an age when even the most cultured nations worshiped idols and held the grossest conceptions of God, with correspondingly low ideals of morals for men. Yet in such ages, the Bible presents a view of God to which the world has been slowly broadening its vision; and a standard of character which rises far above that of Plato, Cicero, or Confucius, and is now adopted as the ideal manhood by ethical philosophers. Whence, but from a divine source, came those lofty teachings of the Scriptures?

9. *Its Influence Upon the World.*—What the Bible has done shows the hiding of its power. (1) *See its effects upon nations.* The lands where it is honored, America, England, North Germany, are the three lands of most advanced civilization and largest hope for the race. The lands where it is forbidden, as Spain, or where it is unknown, as China, are those whose condition is most hopeless. (2) *See its effects upon individuals.* The people who study the Bible are not the drunkards, thieves, criminal classes. Those who have the word in their minds and hearts become purer, better, higher than others. It transforms men from sinners to saints, and its influence makes earth a picture of heaven. No false book, no deceiving book could thus make the world better.

10. *Its Self Convincing Power in Experience.*—There is in the consciousness of man a conviction that the religion of the Bible rests upon a sound foundation. And he who puts the Bible to the test in his own experience, who lives its life, and follows its law, and enjoys its communings, finds an assurance to the satisfaction of his spiritual nature, that this book contains God's message to his soul. Every Christian's experience is, therefore, a testimony to the truth and the inspiration of Scripture.

[To those who wish to pursue this subject further we recommend the following works: "Credo," by L. T. Townsend; "The Logic of Christian Evidences," by Dr. Wright; Chautauqua Text Book No. 18; "Christian Evidences," by Dr. Vincent; "The Christ of History," by Principal Young; "Historical Illustrations of the Old Testament," by Rawlinson & Hackett; "The Story of Creation," by Dr. Campbell; and "Farmer Tompkins and His Bibles," by W. J. Beecher, D.D.]

CHAUTAUQUA NORMAL CLASS.—S. S. SECTION.

LESSON II.—THE SUPERINTENDENT: HIS QUALIFICATIONS, DUTIES AND RESPONSIBILITY.

By R. A. HOLMES, A.M.

In Lesson I we considered the place, purpose and prerogatives of the Sunday-school. That it may keep to its place, accomplish its purpose, and enjoy its prerogatives, efficient organization is necessary. By universal consent the chief officer of such organization is called "The Superintendent." Experience has proved that the character of the school and its success or failure, as measured by the standards already given, depend very largely upon the character of the superintendent and his understanding of his work. This lesson will content itself with answering briefly three questions:

I. *What are the Qualifications of the Model Superintendent?*—The purpose of the school is the conversion and spiritual education of those who are under its influence. This, therefore, must be the purpose of the superintendent. As one can not teach what he does not know, so he can not accomplish a purpose unless he knows practically the steps which lead to its accomplishment. The superintendent therefore must be (a) *both converted and spiritually educated.* Conversion implies oneness with Christ in will and desire. Christ's will is the conversion of the world. To effect it he instituted the church on earth. The superintendent must therefore be (b) *a member of the church, and a firm believer in it and its power.*

The church in its endeavor to accomplish its holy mission has instituted the Sunday-school. Its special function is the teaching of the word. Its great need is and has been competent teachers. Their appointment and continuance in office rests with the superintendent. The superintendent should therefore be (c) *a good judge of human nature; (d) a person of approved teaching ability.*

The school in active operation uses as its only text-book the Holy Scriptures. The text-book is a difficult one. It deals with the deepest problems of spiritual life and death. It is the offspring of a remote day, and is filled with allusions to a state of society and social customs entirely foreign to anything with which we are familiar. A trained teacher in secular education with no knowledge of this book may make utter failure as a teacher of it. A knowledge of it in its entirety is absolutely essential to the teacher in the Sunday-school. The superintendent must therefore be (e) *a thorough and intelligent scholar in Bible lore.*

The membership of the Sunday-school, aside from teachers and officers, is largely composed of children and youth. By nature humanity tires of monotony. Children are more restive under monotonous routine than those who have won self-control by culture. To keep in the school its children and youth, to keep them interested in its purposes while in the school, and to hold them untiringly to the true work of the school, needs fertility of brain to give proper variety to the conduct of the school, intelligence to discern the effects of all measures that are adopted, tact to change and adapt to the ever varying conditions of school life, and common sense to direct and govern the whole. The superintendent must therefore be (f) *a person fertile in expedients* and (g) *a person of intelligence, tact and common sense.*

But often in the conduct of the school infelicities occur. The different parts do not move in harmony with each other. Cases of variance between pupils and teachers arise. Often times the school suffers from financial lack. The chief officer of the school is the one to whom all such matters come for final adjudication. The superintendent therefore must be (h) *a person of good executive ability*, that with firm, strong hand he may hold each part of the system of which he is the center revolving in its own orbit, never flagging, never tiring, never ceasing to do its own part in the work, never clashing with any other. Such are some of the principal qualifications of the superintendent.

II. *What should be his personal character?*—In general, all that is suggested in the foregoing outline as to qualifications. But our requirements must not end there. A man may be a so-called Christian and yet be far from possessing the character which is an essential to the Sunday-school superintendent. He may be a church member, and be even less than a so-called Christian. He may be a good judge of human nature, and yet himself a poor illustration of it. He may be possessed of fine teaching power, and yet misuse it. He may know the Bible as well as Erasmus, and yet be like Erasmus, the subject of Luther's keen reproach of being everything in word, and nothing in deed. He may be all we have described, and yet lack in character.

The superintendent therefore should be pious, "having rev-

erence for God, and for religious duties." He should be devout, that is, should carry into daily life the active expression of his piety. This would forbid sudden anger, inconsiderate levity, trifling with Scriptures, by thoughtless quotations, and all outward conduct that does not comport with true consecration. He should be honest, truthful in word and act, humble, loyal, and scrupulously observant of the Sabbath.

His constant motto should be as he daily studies to build character in himself and others, "Study to show thyself approved unto God, a workman that needeth not to be ashamed." Let the student make for himself an outline of what the superintendent should be in character.

III. *What are his duties?*—They are four fold. (1) To his church. (2) To his pastor. (3) To his teachers. (4) To his pupils.

His duties to his church are plain.

1. *He should attend the regular services of the church regularly.*—This can admit of no negative. He should do it for its effect on himself. He should do it as an encouragement to his teachers. He should do it as an example to his pupils.

2. *He should impress habitual church going as a duty upon his teachers and pupils* from the desk in the Sunday-school room, and should use all means to effect the object.

3. *He should contribute regularly and uniformly to all the benevolent objects* which the church presents as worthy of Christian liberality. The reasons for this are too plain to need mention.

4. *He should urge to the same duty the teachers and pupils of the school*, that they may each do their part, no matter how small, in the work of Christian benevolence.

5. *He should contribute of his means as God prompts* him to the support of his church, and not measure himself by the standard of proportionate values. He should also teach the same duty in his school.

6. *He should be loyal to his own particular church*; should know its particular beliefs; should pray for its particular welfare; and fearlessly do whatever lies in his power to promote its purity and peace.

II. *His duties to his pastor.*

1. Is that of *Coöperation*. The pastor and superintendent should know each other's plans and purposes thoroughly. The pastor should always be able to feel that in his superintendent

he has one upon whom he can depend, who will aid him in his work; share with him a certain portion of the duties devolved upon him, and in all possible ways be like Aaron and Hur, hand upholders in the fight against Amalek.

2. That of *Allegiance*. The pastor is the one man of all the church upon whom all eyes are fixed. Among his multitude of acts, some will be misunderstood. Among the multitude of tongues some will be captious and critical. A spark may kindle a conflagration. The superintendent owes it to church and pastor to be loyal to his pastor and render him the knightly service which the king could expect from the lord. He should also teach the same duty to teachers and pupils in the school.

3. *He should be his Pastor's Index Rerum*; not his mentor, but his reference, to which he can turn for information concerning affairs in that portion of the church represented by the school. Sick children to be visited, poverty to be helped with true charity, anxious souls looking for the Savior, these and many similar are within the superintendent's knowledge oft times, when unknown to the pastor. To bring them to the pastor's knowledge is an evident duty.

4. That of *Harmony*. The pastor and superintendent should agree. The school should have no plans or methods contrary to the pastor's desires. Church and school should walk the same path, and in it go hand in hand.

III. *His duties to his Teachers*. While these are many we mention but five, and these without discussion, leaving the student to fill up the outlines.

1st. *Supervision of Work*. 2d. *Personal and close Acquaintance*. 3d. *Frequent Visiting*. 4th. *Individual Coöperation*. 5th. *A Weekly Teacher's Meeting*.

IV. *What are his duties to his Pupils?*

1st. *To know each one personally*. It is the measure of the superintendent's power. 2d. *To visit them at their homes*, or to insure a visit by their teachers. It is his chief means of knowledge concerning them. 3d. *To review their knowledge of the lesson* regularly, from week to week, and at the quarter's end to conduct a thorough and systematic review of the quarter's teaching. 4th. *To urge them to all of the various duties* which are required of one in the Christian life. 5th. *To aid their home training*, or supplement it, in providing suitable methods for using their spare time. 6th. *To set before them the constant example* of a pure and holy life.

EDITOR'S OUTLOOK.

THE C. L. S. C. PLAN.

No organization that has appeared in the past fifty years has been more favored than the Chautauqua Literary and Scientific Circle. From the first the surroundings have been such as to aid its growth. Eminent educators and literary men pronounced their blessings on its head the day it was born. Thousands of people shouted its praises to the echo, in the grove at Chautauqua, as soon as they saw what it was and heard its name. Chautauqua had a history of five years, to place behind the C. L. S. C.—a history of enterprising investigation in the fields of science and philosophy, Biblical literature, church and Sunday-school work, and moral reforms. It was five years of hard work to popularize useful information on all these lines of thought. This was a good beginning for the C. L. S. C., and right here it started. With the summer meetings at Chautauqua it has been associated during these first five years of its history. The C. L. S. C. Commencement exercises are held in the Hall of Philosophy, in St. Paul's grove, at

Chautauqua, and from thence the diplomas are sent out to the graduates all over the world.

It never was the design of Dr. Vincent or Mr. Lewis Miller, the founders of Chautauqua, that all the work of students should be pressed into the compass of three weeks of meetings in August, but rather that Chautauqua should be carried into towns and cities, into homes and offices and workshops all over the land. When the C. L. S. C. appeared and its curriculum was announced with the promise that every person who should complete the four years course of reading in ancient and modern history and literature, the sciences, philosophy and art, would graduate and receive a diploma signed by the officers of the C. L. S. C., the idea was easily carried abroad. The press of the country was ready, as we now see, to assist. The plan was written up and philosophized upon from the beginning; but more than this was needed to insure success. To make the Chautauqua Idea as practical in a town five hundred or a thousand miles away as it was at Chautauqua was a hard task

to perform; but when it was decided that the *individual* could enroll his name in the C. L. S. C. office and pursue his studies at home, or when traveling, by devoting forty minutes a day to his books, and could fill out examination papers at the end of each year, the practicability of the plan was admitted by everybody. The organization was simple, the working of the system has been almost perfect, and each succeeding year has witnessed a marvelous growth; classes ranging from 7,000 up to 14,000 members have been enrolled from year to year until the present outlook is more encouraging than all the past.

The local circle has come to be an important factor in the working of the organization. Men are clannish, and in the work of education the world has always recognized the social element as a powerful agency. It was natural that in the C. L. S. C. men and women, who had no scruples on the question of the co-education of the sexes, should come together and effect local organizations, elect their officers and do their work methodically, under the inspiration of one another's presence. Just as in raising a building ten men are stronger than one man, so in a town or city ten persons will lift up the Chautauqua Idea in more homes and attract the attention of more people to it than one person possibly can. "In union there is strength," and while the practical working of the "local circle" is to be seen in the growing intelligence of its individual members, it is a fact that through the local circle the C. L. S. C. is taking hold of the people in all parts of our land, and thus demonstrating that the founders of Chautauqua have inaugurated an educational system which has the merit of being a "Home College," whose privileges may be enjoyed by all classes and conditions of people. While it is not sectarian or even denominational, it is Christian, and carries correct ideas of God and the Bible, of Jesus Christ and redemption, of the Holy Ghost and Christian life into every reader's mind and into every family where the course of study is received.

MARTIN LUTHER.

Our heritage of civil and religious liberty is an outgrowth of the Reformation, begun in the fifteenth century. By common consent the Protestant churches confess indebtedness to Martin Luther, the principal agent raised up by God for the deliverance of his people. We gladly join our brethren of a free press and the heralds of a free gospel, in making some mention of this fourth centennial day. Want of space must greatly abridge the tribute we would bring, and forbids any attempt to weave such fitting chaplets as other hands will certainly bring to the altar.

Four hundred years ago to-day, November 10, 1483, Martin Luther was born in Eisleben, Saxony. The great German reformer, whose words shook the world, and whose power, after centuries, is felt by millions indebted to him, was of humble origin, his parents being peasants of the poorer class, but religious, honest, self-respecting people. He refers tenderly to them, and says: "In supporting their family they had a hard and bitter fight of it." His own privations and hardships in early life were met with something of the heroism and persistence of endeavor that marked his later years. In school, though a sprightly lad, full of fun and frolic, and often corrected for his faults by a severe master, he was yet a diligent student, eager for communion with all truth. His ambition and thirst for knowledge led him gracefully to accept what was unfavorable in his circumstances, yet not passively or without methods of improving them. The spirited youth, with some others under like pecuniary embarrassments, rather than leave school, for a time sought bread in the neighboring villages, and found way to the hearts of their benefactors by singing at their doors. The songs of the boys seem to have been offered and accepted as a remuneration for the material aid they needed, and thus the depressing sense of mendicancy was not so seriously felt. He earned his master's degree when yet

young, having by his proficiency in both classical studies and philosophy attracted the attention of some scholarly men. He left school with honors, but not happy. Soon after began the great struggle of his eventful life. On a careful introspection he found in his quickened soul cravings that human knowledge could not satisfy. Educated a Catholic, and observant of all their rites and ceremonies, but finding little comfort in them, in his unrest and almost despondence, he entered a monastery, thinking by fastings, penance and prayers to find relief for a wounded conscience. The way to him was dark; the conflict terrible; the unhappy monk knew of sin, but not the Savior. The day of his deliverance was at hand, though for a time he saw but the dawn. With the Bible found in his cell as his almost only guide, he at length clearly apprehended the way of salvation by faith alone—believing he was justified. The change was great, and the whole tenor of his after life confessed it. The strong, earnest, cultured man, rejoicing now in the gospel liberty, himself baptized with the spirit and fully consecrated to work for others, was a fit instrument for inaugurating any needed reformation. Led by the spirit and ever true to his convictions, he was soon, though wishing to avoid the issue, in open conflict with the Papal authorities. How bravely, and with what results the battle was fought, is well known. It was an open, manly fight. Any disguise with him was simply impossible. He never masked his own position, nor sought to flank that of the enemy. The warfare, on his part, was honorable, but the shafts he forged were pointed, and hurled with tremendous force. His multitudinous disquisitions, essays and replies came in quick succession, as the exigencies of the controversy called for them. He wrote, any reader will say, rapidly, from the fullness of his mind and heart; and very few authors have left on their works so strong an impress of their own personality. He is perhaps best known in his "Table Talk." There is a freshness in these off-hand sayings that is charming, and quite disarms criticism. His greatest gift to the German people was his faithful translation of the Bible into their vernacular, and his commentaries that are still held in high esteem. The reformer's influence, great while he lived, has increased immensely during the four centuries. As a biblical critic and expositor his ability is now recognized by the general church. He held to the spiritual and supernatural in religion, but recognized the human as well as divine factor in the books of the Bible, and in that, too, the church is in sympathy with him.

THE TEMPERANCE QUESTION.

Of this question it is the political aspect which at the present time is most prominent. It is becoming a grave, disturbing force in our politics. Viewing the temperance cause in the light of political action, it is clear that it is advancing, and that those who have the cause at heart have reason to thank God and take courage. No little chagrin was felt when it was known that the noble action of the people of Iowa a year ago, in voting for constitutional prohibition, was, owing to a technicality, of none effect. But again in that great state the battle has been fought; this time in a different way. The Republican party there had the wisdom to champion the prohibition measure; this plank was squarely inserted in the party platform, and in the campaign recently closed it was the leading issue. We have the result of the election, and it should give the friends of temperance encouragement and hope. A second time this righteous principle has triumphed. The Republican party has won the day, and if its avowed purpose is redeemed in the State of Iowa, the sale of strong drink will soon be made a crime. We turn to the state of Ohio, and here, too, we see sure tokens that the temperance cause is moving forward. The confession comes from prominent politicians, that if, in Ohio as in Iowa, their party had adopted prohibition it might have been better. This was not done; but the question in the late election was

submitted to a popular vote and the result, all things considered, is most encouraging. Some sanguine people may have had faith that the prohibitory amendment would be carried, but perhaps the number was not large. That it received the great vote it did in a state where the liquor interest is of such magnitude and so strongly entrenched, is something to cheer and make thankful the hearts of good people.

One does not need the vision of a prophet to see that the day of the triumph of prohibition in our country is coming on. The right is to win. The time is in the not-distant future when state laws and state constitutions will say that men shall not make their living by pandering to the depraved appetite of fellow men. The rum-seller's business will be made illegal and criminal. Even those who are looking forward to the prohibition of the liquor traffic by the national constitution will not long be called fanatical and visionary. But meanwhile other work for temperance besides that looking to this condition of things, so much to be desired, should not be neglected. Personal effort to preserve the youth and reclaim men is always demanded. People are clearly in error who say: "Prohibition or nothing." Laws whose aim is the curtailing of liquor selling, should be sought, enacted, sustained and enforced as better than none at all. Until we can have prohibition, let us have as stringent restrictive enactments as possible. It is a short-sighted view of things which prompts such a sentiment as this: "If we can not have prohibition, let us have free rum." The adage of the "half-loaf" and the "whole" is full of sound wisdom. We can but think there are earnest temperance men who make a grave mistake. Prohibition—unquestionably the true measure to apply to the liquor traffic, and for whose adoption we should persistently work—fills their minds and hearts. They bend their energies to secure this. But for other legal measures, falling short of this desideratum, and aiming only to restrict the wretched traffic, they have no support. Everywhere restrictive liquor statutes are seen very imperfectly executed for want of interest and determined effort on the part of temperance people, whose rigid enforcement would work a grateful change in our communities. If the law says that the saloon shall not be opened on Sunday; that it shall be closed at a certain hour of the night; that intoxicants shall not be sold to youth under a certain age, or by any provision looks to the diminution of the great curse of our people, it should be regarded as good so far as it goes, for so much of prohibition as it contains, and should have the support of good citizens, though their hope looks and their labors are directed to the total prohibition by law of the sale of strong drink as a beverage. To make the best and most of what we have is the true policy in every issue of life. If we can not have prohibition now, we can see that our laws are enforced. When they are thoroughly enforced, we will be much nearer prohibition.

AN EXTRA DAY IN THE CALENDAR.

"There is an island off the coast of New Zealand where the day of the week changes. There Saturday is Sunday, and Sunday, Monday. When Sunday noon closes, Monday noon begins. A man sits down to his dinner Sunday noon, and it is Monday noon before he is done eating."

A correspondent sends us the above statement and asks, is it correct? We answer: Not to the islanders, who, as ourselves, have but 365 solar days in a year. But to a stranger coming there on his voyage round the world, who has 366 at his disposal, it is true. He has one day to spare, has no name or place for it in the week, and just drops it out of his reckoning, as though it had never been. The explanation is simple enough, even for the young. The revolution of the earth on its axis, from west to east, once in 24 hours, gives the sun an apparent motion round the earth from east to west. To us the sun rises and sets. The succession of day and night is just the same as if the sun really went round the earth. As the sun's apparent motion is from east to west, a man traveling eastward, at whatever speed, will see the sun rise, reach the meridian, and set, a little sooner each day than the day before. So the time indicated by his watch, and that by the sun will differ more and more as he goes on; and what he gains each day in time will evidently be to a solar day, as the distance traveled is to the earth's circumference. One degree east will make a difference of four minutes, fifteen degrees an hour, one hundred and eighty degrees twelve hours. Having reached the one hundred and eightieth meridian, his chronometer and the sun are just twelve hours apart, so he changes his reckoning, to avoid confusion, and at noon Sunday calls it Monday. The correction is of course too much, but if he waits till beyond that time it amounts to more than half a day, and is constantly increasing. If the error is to be corrected all at once—and this is the only way that is found practicable—it should be done when it amounts to half a day. When he has completed the circuit of the earth a whole day will have been gained. If another man, from the same place of departure, go west, or with the sun, he will lose a day, and the two meeting would be, if neither had changed his reckoning, two whole days apart—yet each had the same number of hours and minutes. He who had the greater number of days had them just so much shorter. There is, of course, no reason in the nature of things, why the days of the week should be changed on the one hundred and eightieth meridian rather than elsewhere. There must be some point from which longitude is reckoned, and to avoid confusion English and American navigators agree on Greenwich, near London, and their nautical charts, almanacs, etc., are arranged accordingly. If they had taken as their starting point Washington, the one hundred and eightieth meridian would have been west of where it is, the number of degrees between the places.

EDITOR'S NOTE-BOOK.

The privilege of joining the new C. L. S. C. class just forming will be granted till the first day of January, 1884. This class will graduate in October. It begins work with genuine Chautauqua enthusiasm. Send applications for membership to Dr. J. H. Vincent, Plainfield, N. J.

The Protestant Episcopalians held their General Convention in Philadelphia in October, and during this month they consecrated an assistant Bishop for New York City, and another for the city of Baltimore. The Methodist Episcopal Church will hold their General Conference in the same city in May, 1884.

General Sherman says that he regards the Indian question as substantially eliminated from the problem of the army. The completion of the trans-continental lines of railway, and the extensive emigration into the territories have made large contributions to the settlement of the question. But for all that, we shall find many demands made upon us by the Indians in the future. Fair treatment of them will go far toward preventing trouble.

Governor Murray, of Utah, reports to the Secretary of the Interior that a secret organization among the Mormons, which

has been in existence for a number of years, nullifies the laws of the United States and prevents the execution of the decrees of the Supreme Court. The Governor proposes to repeal the act giving a legislature to the territory, and to rule the people directly by the United States Government. That is a good suggestion, but why does not Governor Murray do something to prevent Mormon missionaries importing men, and especially women, from European countries to keep their ranks full? We send missionaries to foreign lands to preach the gospel, and permit the Mormons to bring agents of evil over here by the hundreds and thousands.

The lively canvass for the election of Mayor of Brooklyn, N. Y., has brought to light the fact that the cost of the Brooklyn bridge was \$21,000,000.

That fine military organization known as the Cleveland Greys has decided to purchase ten acres of land on the shores of Chautauqua Lake for a summer camping ground.

General Sheridan is now commander of the armies of the United States. His abilities as a fighter, which made his splendid reputation in the Shenandoah Valley and on other fields of battle, are not needed now, but rather the qualities which made him an excellent quartermaster as a staff officer. The nation is to be congratulated that while the great generals of the war, Grant and Sherman, are retiring, so capable and worthy an officer as Sheridan, who won a world-wide fame by his skill and heroism in battle, is promoted to this important command.

It is estimated that the German-American element in this country can not fall short of nine millions. This embraces all that were born in the Fatherland, and all that were born of German parents in this country, and that speak the German language.

Three hundred thousand voters in Ohio declared themselves in favor of constitutional prohibition at the election in October. The moral force of that vote is tremendous. Never before did the Prohibitionists, who believe in carrying their cause into politics, act more wisely than when they compelled an old and powerful political organization to take up their cause and plead for its success—"wisdom is justified of her children." If they did fail the effort was a great success, as is every action for a good cause. When the dominant political party shall adopt prohibition as one of the chief planks in its platform it will hold the Christian and temperance voters in its ranks, but when it throws this cause overboard these people will think seriously of turning their political machinery upside down.

Mr. V. C. Dibble expresses these sensible views on a live question in a recent number of the *Journal of Education*: "The objection to classical culture rests upon the assumption that it is not practical; an assumption which, although not uncommon, is nevertheless incorrect. There is no issue between classical education and that which is practical. The only education worthy of any serious advocacy is the practical—that which is adapted to the condition of its subjects, and which will prepare them for the real work which life will demand of them. Education is in fact life begun."

The paper on which the United States currency is printed is manufactured at Dalton, Mass., and the Boston *Herald*, in a recent issue, gives the following particulars: Eighteen or twenty Treasury girls, who earn \$3 a day, count the sheets, examining each one closely, and rejecting all imperfect ones. An automatic register at the end of the machine registers every sheet as it is cut off and laid down. The register man takes them away in even hundreds, and they are immediately counted in the drying room. In all the various processes of finishing every sheet is counted, and they are again counted on their re-

ceipt at the Treasury Department in Washington. The great protection of the government against counterfeiting lies in the paper here made. The distinctive feature is the introduction of colored silk threads into the body of the paper while it is in the process of manufacture. They are introduced while the paper is in the pulp, and are carried along with it to the end of the machine, where it is delivered as actual paper. This has been more fatal than anything else to the professional counterfeiters.

The political work during the past month has been a contest in several states for state officers. Massachusetts has attracted the attention of politicians everywhere, because General Butler was the most conspicuous figure in the campaign. He was a musical candidate. Editors of political papers never failed to criticize him and to praise him. He mixed up with schools, charitable institutions, moral reforms, and the industries of the state. He has been defeated by a heavy majority, and Mr. Robinson, the Republican candidate, elected over him. It is now predicted by the wise ones that this will close General Butler's race for the presidency, but this may prove to be false, because all ordinary rules fail when applied to an abnormal character like General Butler. He rides the stormiest sea of any man in American politics.

Concerning candidates for the Presidency, all aspirants seem to be using a kind of tactics that will keep their names out of sight, while they gather all the strength possible for the coming struggle. In late years a number of eminent men have run well in the newspapers and in political street talk, but when the votes were counted in the National Convention they failed. Senator Don Cameron is in Europe, and rumor says he will remain there till late in the summer of 1884. Ex-Senator Conkling has lost his political influence, and Senator Logan is obliged to share the political fortunes of his party in Illinois with Secretary Robert Lincoln. This trio, Cameron, Conkling and Logan, who were mighty forces in the last National Republican Convention, will not be able to dominate the action of their states in the next campaign for the Presidency. Perhaps, as one result, the voice of the people will be more potential, and, in such a case, correct ideas of government will triumph.

Ready made houses is an important branch of manufacturing in some parts of the country. "A correspondent of the *Old Colony Memorial* paid a visit not long ago to Fairfield, Maine, where a large establishment is located for the production of these knock down houses, and he says that few have any idea to what extent this business has been carried in Waterville and its neighborhood, or to what perfection it has been brought. In the establishment to which we refer dwelling houses are made, like boots and shoes, in any quantity, and of any size or style, and for any market in the wide world. Not long since this concern received a single order for fifty houses for Cape May, to be delivered speedily and in complete finish. These houses were to be, not sheds nor shanties, but regularly ordered dwellings; and they were made accordingly and so delivered, and contain hundreds of occupants at this moment. An order will be received for a \$50,000 hotel, or an ornate, French-roof, cottage for a fine country estate, and these as easily and expeditiously furnished as an ordinary boarding house for a country village, or a barn for a ranch in Kansas or Colorado." This would be a good plan for persons to adopt who contemplate building cottages at Chautauqua. Try it.

"The first railroad in Palestine is being laid out, and the preliminary survey has been completed as far as the Jordan. It is to run between Acre and Damascus, and is called the Hamidié line, because it is named after his present Majesty, the Sultan Abdul Hamid. Probably one reason why the firman has been granted so easily lies in the fact that it passes through a great extent of property which he has recently acquired, to

the east of the plain of Esdraelon. The concession is held by ten or twelve gentlemen, some of whom are Moslems and some Christians, but all are Ottoman subjects resident in Syria. Among the most influential are the Messrs. Sursock, bankers, who own the greater part of the plain of Esdraelon, and who have, therefore, a large interest in the success of the line."

Several eminent Englishmen have visited this country during the past month. Lord Coleridge, representing the law, Henry Irving the stage, Matthew Arnold, literature, and Père Hyacinthe, theology. The reception of these gentlemen in our eastern cities indicates that the world has a peculiar fondness for its own. Henry Irving was received by more people, entertained more elegantly, and eulogized with more applause, than any one in the list. Yet he has not done a tithe as much for the elevation of his fellow men across the waters as any one of the others. Is it not still true, "The children of this world are wiser in their generation than the children of light?"

A Hindoo prophet, Babu Protap Chunder Mozoomdar, has come to this country from the Orient. He was educated in the religion of Brahminism. Some years ago he renounced idolatry, and in company with his cousin, Keshub Chunder Sen, joined the Brahmo Somaj, a theistic movement started in 1830 by Ram Mohun Roy. Mr. Sen and Mr. Mozoomdar have since become prominent leaders in this religious and social movement. Mr. Mozoomdar left India last spring for a tour around the world. He is about forty-two years of age, is above the average height, is of dark complexion and finely-cut features. He is the author of two books; one on "The Faith and Progress of the Brahmo Somaj," and one just published entitled "The Oriental Christ," which is a devout and poetic conception of Christ as seen by an Oriental mind.

The term "dude" is a very convenient nickname for the over-nice or simpering individuals who are found in considerable numbers on every line of the world's work. There is the fashionable dude, scholarly dude, literary dude, artistic dude, etc. They are a useless class of persons, unless they serve as scare-crows to frighten other people from the line of life on which they move. Perhaps this is as good service as can be claimed at the hands of such a set of weaklings.

The Arctic relief expedition has proven to be a great failure. No relief for the Greeley party was provided by the expedition, and yet it has returned home. The verdict which public opinion seems to render is, that the "Arctic Relief Expedition" was *badly managed* from first to last.

It is said that one result of President Arthur's visit to the Northwest is a determination to appoint only residents of territories to the important territorial offices. This is a concession to the people of the territories who are dissatisfied with appointments from without.

The decision of the Supreme Court on the Civil Rights bill turns the whole question over to the government of the states in which the colored people live. If they do not secure justice there, they have another high privilege in reserve, namely, the right of appeal to a higher court.

The dynamite explosions in October, on the underground railroad in London, were ineffectual attempts as movements either against the city or general government. Some Irish leaders claim that the Irish did not do the mischief, but that designing Englishmen who mean to keep up perpetual war between Ireland and England, were the guilty parties. The ways of this conflict are as dark as the railroad tunnel under London.

The Chautauqua Board of Trustees will hold their annual meeting at the Sherman House, in Jamestown, N. Y., on Wednesday and Thursday, the 9th and 10th of January, 1884.

The *Deaf-Mute Advance* comes to our table once every week, from Jacksonville, Ill. As the name indicates, it is published in the interest of deaf-mutes, and is doing much to inspire with a desire for education the class of people to whom it ministers. In a late number the editor says: "A young lady from the country came to Danville some days ago, driven by a green boy, who had his first view of town life. She had occasion to go to the Deaf and Dumb Institute, and the boy, when he went home, said he saw the people there 'winking at each other on their fingers.'"

Mr. Moody successfully opened his great mission in England on Nov. 4. Four meetings were held, each of which was attended by from 4,000 to 6,000 persons. The iron hall built for the occasion proved to be complete in all its arrangements, affording seating room for 5,800 persons. All around on the sides of the hall appropriate texts were displayed, such as "God is Love," and over the platform, "We pray you in Christ's stead be ye reconciled to God." Mr. Sankey sang with customary effect. Mr. Moody's powerful addresses showed that he had not lost his hold on the people. At the close of the evening meeting a man in the hall shouted out that Mr. Moody's last mission in London had been a failure. Mr. Moody answered by calling for volunteers to come out boldly on the Lord's side, whereupon about three thousand men arose *en masse*. The incident caused much excitement.

The first number of *The Outlook*, the paper published in the interest of the class of '84, is out. It is a stirring little sheet, brimming over with class news, class gossip and class enthusiasm. The '84s are especially fortunate in having such an editor as Mr. Bridge to lead them. This little quarterly will undoubtedly do much toward awakening the class and making their closing year even more brilliant than their beginning. Let every member subscribe.

A novel and entertaining exhibit was held in Paris in October. It was called "The Exposition of the Incoherent Arts," and was arranged by and contributed to by young artists. Such a collection of absurdities is rarely seen, this one being on a much larger scale than those in previous years, and those who attend go to laugh. It is necessary to be a Frenchman and a Parisian to thoroughly appreciate all the happy hits and plays upon words, but even a foreigner can find food enough for laughter. The proceeds of the exhibition are for the poor of Paris, and it is expected that it will net quite a good sum. The exhibition abounds in pictures of the realistic school. For instance, where there is a figure wearing a shoe it will very likely be a genuine shoe attached; or hair will be stuck on instead of painted, suns and moons be represented by gold and silver paper pasted on, and one painting gives a ship sailing along accompanied by fishes, the fishes being two or three regular dried herrings glued to the canvas. One of the most prominent pictures is a portrait of the lecturer and critic, M. Henri de Lapommeraye. The hair and mustache, the eyeglass, the book just laid down, the letter he is reading, and the glass of sugar and water at hand, are all real objects attached to the picture, and of course, stand out most "naturally" from the canvas. No. 85 is entitled, "Poem of a Pig." It is a very striking geometrical fantasy, the five different handlings of plain geometrical figures giving a pig drama in five acts. First act, pig strolling along seeking whom he may devour; second act, a sudden noise startles him, he scents the wind; third act, feeling he is pursued, he turns his head; fourth act, a knife shines in the air, he guesses, he flees; fifth act, fate is fate, and the beast sees heaven. No. 167 is "A Wild Pansy" (study of flowers). One forgets that "*une pensée sauvage*" can also mean a savage thought, and the surprise comes in to find the flowers of the picture are a fierce young boy and a scared-looking cat, and the boy is murdering the cat by running a spear through its neck. These are but samples of the whimsicalities.

ASTRONOMY OF THE HEAVENS FOR DECEMBER.

By PROF. M. B. GOFF.

THE SUN.

On the twenty-first day of this month, in our latitude, occurs the shortest day in the year. The sun rises at 7:20 and sets at 4:37, making the day's length 9 hours, 17 minutes. This is also the day on which properly our winter begins. The sun has reached the winter solstice, his most southerly point, and now begins his journey northward, causing the days to grow gradually longer.

THE MOON.

The moon's phases occur in the following order: First quarter, on the 7th, at 6:38 a. m.; full moon on the 13th, at 10:20 p. m.; last quarter on the 21st, at 3 a. m., and new moon on the 29th, at 7:51 a. m., Washington time (or, according to the "new reckoning," eight minutes and twelve seconds later in each case). The moon approaches nearest to the earth on the 12th, at 10:24 a. m., and is farthest away on the 24th, at 10:12 a. m. Its greatest altitude in this latitude will be on the morning of the 14th, when it will be $60^{\circ} 53'$ above the southern point of our horizon.

MERCURY

Will be evening star during the entire month. But it matters little, so far as seeing it with the naked eye is concerned, until near the close of the month, whether it be morning or evening star. On the 1st it sets at 4:35 p. m., and is then too near the sun to be seen. On the 30th it sets at 6 p. m., a few minutes before the moon, and about $5\frac{1}{2}^{\circ}$ south of the latter body. On the 31st it sets at 6:03 in the evening, about one and one-third hours later than the sun, and $1\frac{1}{2}^{\circ}$ north of where the sun disappears. On both these evenings, and for several days both before and after these times, this planet is visible to the ordinary eye, and by its bright white light is readily recognized. Although visible several times each year, it is a remarkable fact that it has been seen by comparatively few persons. In the higher latitudes it is much more difficult to see than in the lower, and the atmosphere of some parts of Europe is very unfavorable for its observation.

VENUS

Will also be evening star throughout the month, setting on the 1st at 5:36, and on the 31st at 6:36 in the evening. It is at its greatest distance from the sun at 2 p. m. on the 12th. By far the brightest star in the west after sunset, a failure to recognize it would be almost impossible. It is the *Hesperus* of the ancients. On the evening of the 31st it is about seven degrees south and a little west of the moon.

MARS

Will be the morning star, rising at 9:45 p. m. on the 1st, and at 7:51 p. m. on the 31st. From the 1st to the 23d it will have a direct motion, that is, a motion from west to east, of 11 minutes and 18 seconds of arc; on the 23d, it will be stationary, and from the 23d till the end of the year it will have a retrograde motion, that is, from east to west, of one minute and forty-two seconds of arc. About nine o'clock on the evening of the 18th, it is north of the moon $8^{\circ} 18'$.

JUPITER,

King of the planets, will also rank as morning star. On the 1st he will rise at 8:33, and on the 31st at 6:23 in the evening, and like Mars will maintain nearly the same position in the heavens during the whole month, his motion being $9' 22''$ retrograde. On the 16th, at 9:51 p. m., he will be $5^{\circ} 43'$ north of the moon. The moons of Jupiter can be readily seen with a telescope of moderate power, or good opera glasses.

SATURN,

Though properly an evening star, shines from "dewy eve till early dawn," rising on the 1st at 4:27 p. m., and setting next morning at 6:47; and on the 31st rising at 2:21 in the afternoon, and setting the following morning at 4:42. His motion will be $9' 9''$ retrograde, and on the 12th at 7:53 p. m., he will be 55 minutes north of the moon. The rings of Saturn are an object of great interest to every observer and the present is a favorable time to see them in great splendor, though the view in December 1884 and 1885 will be still finer.

URANUS

Begins the month by rising at 1:02 a. m., (thus putting himself among the morning stars), and at the close of the month at 11:11 p. m. His motion, which is direct, but only $1' 42''$ in thirty days, seems slow enough, but when we reflect that he actually travels an average absolute distance of over thirty million miles a day, we can but wonder at his terrific speed. He is located about two degrees southeast of *Beta Virginis*, and "can be seen with the naked eye, if one knows where to look."

NEPTUNE,

The most distant of the planets, rises on the 1st at 3:30 p. m., and sets on the 2d at 5:26 a. m., and on the 31st rises at 1:31 in the afternoon and sets the following morning at 3:25. His motion is retrograde, and amounts to $2' 34''$ for the month. This planet is of no special interest to the ordinary reader, as "to recognize its disk with ease," requires a magnifying power of three hundred or upward.

C. L. S. C. NOTES ON REQUIRED READINGS FOR DECEMBER.

EASY LESSONS IN VEGETABLE BIOLOGY.

It will be observed that many of the words and expressions used by Dr. Wythe in his "Lessons" are pronounced and explained in the "Glossary and Index." Where such explanations and pronunciations occur, of course no notes have been prepared.

P. 12.—"Albumen," al-bu'men. The word is derived from *albus*, the Latin word for white. Albumen forms a part of all animal fluids and solids. The white of an egg is almost pure albumen. In the vegetable world it is the food laid up for the nourishment of the embryo around which it lies.

P. 13.—"Slide." A small slip of glass about three inches long by one wide. It is intended to place objects on which are to be examined under the microscope. The "cover" here referred to, is a square of very thin glass, which is placed over the object to hold it in place.

"Capillary attraction," cap'il-la-ry. When a capillary (hair-like) tube is dipped into a liquid, there is an attraction between the solid and the

particles or molecules of the liquid which causes the latter to rise in the tube if it wets it, or to sink if it does not.

"Heated stage." The simplest means for heating the stage or slide upon which an object is placed, is by a small alcoholic lamp placed at the corner of the stage.

P. 15.—"32 deg. F." 32 degrees on the Fahrenheit thermometer. This scale, invented in 1714, by Fahrenheit, is commonly used in England and America, although the centigrade scale (where the distance between the boiling point and zero is divided into one hundred parts) takes its place largely on the continent, and in most scientific works.

P. 18.—"Amoeba," a-moe'ba. Readers who live in warm climates will have no trouble in finding the *amoeba* attached to the stems of plants or floating in pools of stagnant water. To find a specimen in December in temperate latitudes will be more difficult, but by collecting grass and stems of water plants, with water from a pool, and keeping them in a warm room for a time, specimens may be obtained.

P. 22.—“Cinchona,” cin-chō’na. The tree from which the well known drug, Peruvian bark, is obtained.

“Quinine,” Kwī’nin is Webster’s preferred pronunciation, kwe-nin’, Worcester’s. Quinine is an alkaloid obtained from the cinchona bark.

P. 28.—“Nucleus.” The nucleus may be easily seen in a thin section from an apple or potato, placed under a microscope.

“Mucilaginous,” mū-ci-lāg’i-noūs. Like mucilage.

P. 29.—“Silica,” sil’i-ca. Flint or quartz.

P. 31.—“Tannin,” tăn’nin, or tannic acid. An astringent principle found in nut-galls and the bark of many trees. If treated with ether a solid is obtained which is soluble in water. It is used in tanning leather.

“Starch.” The grains of starch are easily found. Wheat, oats, arrow-root, sage and tapioca all furnish excellent examples.

“Crystals.” Rāph’i-des is the name given by botanists to the little crystals found in the tissues. A section of an onion will reveal them. Also, the juice of the hyacinth.

P. 34.—“Cochineal Cactus,” cōch’i-neal. The cactus from which the cochineal insects, whose bodies are sold in the shops for a red dye, are obtained. The plant is also called cochineal fig, and is raised with as great care for food for the insect, as is the mulberry tree for the silk worm.

P. 35.—“Vessels.” The “dotted” vessel, or duct, is a long, open tube whose sides are marked by pores, or dots. A transverse section of a radish will furnish an example. A fern will furnish an example of “reticulated” cell; almost any common plant contains the “annular” and “spiral” cells.

P. 36.—“Epidermis.” All varieties of cells will be found in the epidermis together with the mouths, or stomata. For examination a layer should be carefully removed with a razor or knife, a little water put on it to prevent too rapid drying, and the whole covered by a thin glass.

P. 37.—“Volatile oil.” That which wastes away when exposed to the atmosphere; as musk.

P. 39.—To prepare sections of wood for slides there is a very simple instrument which may be made at home by any one possessed of a little ingenuity. Let a block of hard wood be selected, one and one-fourth inches square by two inches in length, its ends perfectly smooth. In one end drill a hole one-fourth of an inch in diameter, lengthwise, one and one-half inches. In the other end insert a common wood screw, its point filed square, until it reaches the hole. In the side of the block, one-half inch from the end in which the hole has been bored, insert another screw, with square point; this is to be used as a clamp. To cut the section take a branch the proper diameter, and which has been boiled in water, place it in the hole, and clamp solidly with the screw at the side. With a keen razor cut off the end even with the block. By turning the screw in the end of the block the branch will be pushed forward any distance desired, and the section can be cut by a sliding motion of the razor across the stem. The slices should be removed from the knife with a camel’s hair brush, slightly dampened, and may be preserved in weak spirits. The work is, of course, very delicate, and requires the skill and nicety of touch which only practice brings. To mount the sections in Canada balsam, as Dr. Wythe advises, the object should be placed exactly in the center of the slide, which must be carefully cleaned from dust, and a drop of the balsam placed upon it; hold the slide over a flame until the balsam spreads over the object. Air bubbles should be broken with a needle. A glass cover, warmed, should now be placed on the object and pressed sufficiently to remove the superfluous balsam. The whole should be put in a warm place until thoroughly dry.

P. 42.—“Showers of blood,” or blood-rain. A shower of reddish dust mixed with rain, which has been known to fall in several places on the eastern coast of the Atlantic.

P. 42.—“Diatoms.” “They are found in great abundance in the mud of rivers, lakes and ponds. They are also present in those deposits of clay which once formed the beds of rivers and lakes, and which are now dry. In order to procure the diatoms from these deposits, the earth or clay should be well washed with pure water, and the deposit allowed to settle and the water poured off. This may be repeated several times. The deposit is then to be washed with hydrochloric acid, and when the effervescence is over, the acid is poured off, and a fresh portion is added. This may be repeated several times. When no action occurs by its use cold, the deposit may be transferred to a watch-glass, and

kept over a spirit lamp, at a temperature of about 200° for three or four hours. The deposit must then be well washed with pure water, and will be found to consist almost entirely of diatoms.”—*Lankester*.

P. 47.—“Fungi,” fūn’ji. No class is so easy to study in the winter. If fruit, bread and the like are allowed to mould, any number of interesting objects will be found. In the woods fungi are to be gathered from bark and old logs. Of these the peziza, or cup-moulds will be found most pleasing. Lichens also abound, and numerous sections can be made from them.

P. 62.—“Big Trees.” These Big Trees are Cedars (*sequoia gigantea*). “Calaveras,” kā-lā-vā-rās.

“Buds.” Many plants form their buds in the fall. A careful search will reveal such for examination. The lilac and trailing arbutus form their flower buds in autumn, and in vigorous plants a section of the bud will show distinctly the flower stowed away for spring.

P. 63.—“Leaves.” “Opposite” leaves are seen in the chickweed and fuchsia; “whorled,” in Prince’s pine; the “alternate,” in the rose family. The arrangement of leaves on the stem has been reduced to a science, called *phyllotaxy*.

P. 64.—“Bracts.” Seen in the camellia and strawberry. The white portion of the calla blossom is a colored bract called spathe; also, the “pulpit” of the common Indian turnip or Jack-in-the-pulpit.

“Sessile” leaves are seen in the upper leaves of the common primrose and spring beauty. All plants of the violet and the rose families bear *stipules*.

P. 65.—“Lanceolate,” as in the peach; *oblong*, the radical leaves of shepherd’s purse; *cordate*, in the blood-root; *sagittate*, in the stem leaves of shepherd’s purse; *ovate*, in chickweed and violet; *pinnate*, as in the rose; *bipinnate*, as in the sensitive plant.

P. 68.—When the stamens and pistils are on separate trees or plants, the fertilization is accomplished in various ways; insects or birds carry the pollen in many cases, in others the wind wafts it.

“*Hypogynous*,” as in the cress, radish, cabbage, and other cruciform plants.

P. 69.—*Perigynous*, as in the rose family; *epigynous*, as in the caraway, celery, and parsnip.

P. 76.—“*Labiata*.” The word means lip-shaped, and the order is named from the peculiar shape of the corolla.

P. 77.—“*Composite*,” or compounded; “*Herbaceous*,” her-bā’shus. Plants with soft stems which die every year.

“*Coriander*,” cō’ri-an’der; “*Asafoetida*,” ās’a-fēt’i-da.

P. 78.—“*Papilionaceous*,” pa-pil’yo-nā’shus. From the Latin for butterfly.

“*Tamarind*,” tām’a-rīnd. A tree 60 to 80 feet in height, with dense foliage. A native of Africa and India. Its pods are preserved and used as a medicine, or as an article of diet.

“*Senna*,” sēn’na. A drug prepared from the dried leaves of the cassia, a shrub raised in India and Nubia. A variety of cassia is found in the United States, but its leaves are less powerful. “*Acacia*,” a-ka’sht-a. “*Mimosa*,” mī-mō’sa.

P. 79.—“*Ranunculus*,” ra-nūn’cu-lūs. The word means a little frog. Pliny is said to have so named this species because many of its members grow in water where frogs abound.

“*Aconite*,” ac’o-nite. A plant related to the Hellebores; the common wolf’s bane, or monk’s hood.

“*Cruciate*,” kru’sht-at. The petals are arranged in the form of a cross.

P. 80.—“*Chimborazo*,” chim-bo-rā’zo. A peak of the Andes in Ecuador. It is the sixth in height among the lofty peaks of the range.

P. 82.—“*Floras*.” The whole number of plants native to any section forms its flora.

“*Urticaceæ*,” ur-ti-ca’ce-æ. Nettles.

P. 83.—“*Rhododendrons*,” rhō’dō-dēn’dron; “*Azalias*,” a-zā’le-as. These plants both belong to the order of heathworts or *Ericaceæ*, the order to which the huckleberry, cranberry, trailing arbutus, and other well-known plants belong.

BIOGRAPHICAL STORIES.

P. 14.—This picture, West declared sixty-seven years after it was painted, contained some touches that he never surpassed.

P. 15.—“Camera-obscura,” cām’e-ra ob’scū’ra. Literally, a dark chamber.

P. 16.—“Parma.” A province in the north of Italy.

“Death of Wolfe.” This picture contained one feature which at that period was entirely new. West used costumes in his picture which were appropriate to the time and character. Before this the classical costume was used on all occasions. It is said that Sir Joshua Reynolds, the president of the royal academy before West, tried to dissuade him from this innovation, but was the first to acknowledge his success.

P. 24.—“Gulliver,” gūl’li-ver. The hero of a satire, “Gulliver’s Trav-

els,” by Swift. He is represented first as a surgeon, and then as captain of several ships. He takes voyages, during which he discovers many strange countries, among them the country of the Lilliputs (lil’li-pūt), a race of little men.

P. 29.—“Uttoxeter,” ūks’e-ter.

P. 34.—“Merry-Andrew.” One whose business it is to make sport for others—a clown, a court fool.

P. 68.—“Oxenstiern,” ōks’en-steern’.

P. 70.—“Lutzen,” loot’sen. A town of Prussia.

P. 72.—“Muscovy,” mus’co-vy. The former name of Russia.

NOTES ON REQUIRED READINGS IN “THE CHAUTAUQUAN.”

GERMAN HISTORY.

P. 129, c. 1.—“Merovingians,” mer-o-vin’gi-ans. The first Frankish king of whom we have authentic accounts was Chlodio, who ruled about the middle of the fifth century. His successor, Merovæus, gave his name to the first *house*, or dynasty of the Franks; of him we know little more than that he fought against Attila.

“St. Remigius,” re-mij’i-us, or St. Remy, reh’mé’. (439?–533.) The Apostle of the Franks. When but a young man he was made Bishop of Rheims. By his zealous work he spread Christianity widely through the Frankish kingdom. A contemporary declares him to have been the most eloquent man of his times.

“Rheims,” reemz. A city in northeastern France, whose bishops date from the fourth century, and whose cathedral is one of the finest gothic edifices in Europe.

P. 129, c. 2.—“Arian.” The religion of Arius, a bishop of the fourth century, who held that Christ, though chief of created beings, was not equal to God. A book lately issued by Appleton & Co., “Arius the Libyan,” will be found to be an interesting account of his life and doctrines.

“Paris.” The first account which we have of Paris is from Cæsar, who visited it in the last century before Christ. It was then but a collection of huts on an island in the Seine, and was called Lutetia.

“Poitiers,” poi-teerz’. A town of France, one hundred and eighty miles southwest of Paris.

“Abderrahman,” ābd-er-rāh’mān; “Viceroy,” vice’roy. One who rules in the place of a king; a substitute. “Caliph,” cal’iph. The successors of Mohammed were all called caliphs.

“Damascus.” Soon after the death of Mohammed Damascus was captured by his followers and made their capital. Such it remained for ninety years. On the fall of the Ommiyades, their successors, the Abbassides chose Bagdad as their capital.

P. 130, c. 1.—“Islam,” iz’lam. Meaning obedience, submission, is a name given to the religion of Mohammed.

“Gregory I.” (540–604.) Born of a noble family and educated for public life, he was made prefect of Rome in 573, but his strong religious nature led him to give up his position, turn over his wealth to the Church and become a monk. Through the fourteen years of his pontificate, Gregory employed every means to purify and strengthen the Church, sending missionaries into all parts of the world, combating Arianism and rectifying many abuses.

“Augustin.” The Apostle of the English. A Benedictine monk at Rome when chosen by Gregory I. to go on a mission to the Saxons. He went to England about 597, was received kindly by King Ethelbert, and allowed to preach through Kent. After a time Ethelbert adopted Christianity and was baptized. This led to the complete triumph of the religion throughout the kingdom. Augustin was made Archbishop of Canterbury, and until his death had charge of the Church in England.

“Holy See.” A name given to the office of the pope, and also applied to the pope himself, or his court. *See* is derived from the Latin verb “to sit,” and literally means a seat, or site, hence a place where power is exercised.

P. 130, c. 2.—“Asceticism,” as-cet’i-cism. The practice common among members of the early Church of withdrawing from all business and society to devote themselves to a rigorous life of penance and self-denial.

“Vatican Hill.” The *Mons Vaticanus* of the ancient Romans, from which the palace of the Vatican takes its name.

“Dacia,” da’ci-a. A province of the Romans north of the Danube, and comprising parts of the present countries of Hungary, Transylvania and Roumania.

“Dalmatia,” dal-mā’ti-a. A narrow strip of country lying along the eastern shore of the Adriatic, now belonging to the Austro-Hungarian Empire.

“Istria,” is’tri-a. A peninsula, now of Austria, on the northeastern coast of the Adriatic.

“The German Crown.” In 1806, one thousand and six years after the crowning of Charlemagne, a league known as the Confederation of the Rhine, and of which Napoleon Bonaparte was protector, was formed between the central and southern German states. Its real object was to aid France against Prussia and Austria. The king of Germany resigned his crown then, and the empire came to an end.

P. 131, c. 1.—“Roland.” Roland, or Orlando, was the nephew of King Charlemagne, brought up by him and trained to be a warrior. He is the hero of one of the most famous stories of the middle ages, “The Song of Roland.” Various authors have used this tale. The *Orlando furioso* of Ariosto, and *Orlando innamorato* of Boiardo, are prominent among these. In a metrical narrative the story was sung by the minstrels of those times. According to this song Charles had been seven years in Spain warring against the heathen, until there remained but one king unsubdued, Marsilius of Saragossa. He had promised homage, and the step-father of Roland, Ganelon, was, by Roland’s advice, sent on an embassy to him. Ganelon was angry because Roland had advised that he be sent, and in revenge betrayed to Marsilius the pass through which the rear guard and most valiant portion of Charles’ army, under Roland would pass. Charles, with the body of his army, passed through, and when Roland appeared with his twenty thousand men, an army of four hundred thousand heathens attacked him. Roland fought until only a fragment remained before blowing his enchanted horn to summon Charles to his aid. Before his uncle could reach the pass every man was dead. The Saracens fled back to Spain, but the king pursued, completely defeating them. But the death of Roland robbed the conquest of all its glory, and threw France into mourning.

“Paladin,” pāl’a-dīn. A distinguished knight.

“Roncesvalles,” ron-thés-vāl’yés. The pass in which Roland and his band were destroyed.

“Otto the Great.” Otto I. (936–973.)

“Ardennes,” ar’den’. The forest of Ardennes lies in the northeastern part of France, covering a portion of the department of the same name, and extending into Belgium.

P. 131, c. 2.—“Frisian,” fris’i-an. Belonging to the Frisians, a tribe formerly living beyond the Batavi, but pushed to the borders of the North Sea by the Franks.

“Aix,” aks. A town in southern France whose thermal springs were known to the Romans.

“Alcuin,” āl’kwin. (735–804.) His great reputation for learning caused Charles to invite him in 780 from England, his native country, to open a school in France. This institution is supposed to have been the germ of the present University of Paris. Alcuin afterward opened a school at Tours, which became very famous.

“Verden.” A town lying southeast of Bremen, in Prussia.

P. 132, c. 1.—“Haroun-al-Raschid.” See notes in THE CHAUTAUQUAN for November.

“Bretons.” The inhabitants of Brittany, the triangular peninsula which extends from the western coast of France into the Atlantic Ocean. “Almayne,” al'-main.

P. 132, c. 2.—“Eginhard,” ēg'in-hart. He had been a pupil of Alcuin, and by him was introduced at court. Eginhard's history of Charles and his accounts of the Franconian kings have given him a permanent place among the writers of the middle ages. See Longfellow's poem, “Emma and Eginhard,” in “Tales of a Wayside Inn.”

NOTES ON GERMAN LITERATURE.

It will be found helpful to read the extracts from German Literature in connection with the “Outline of German Literature” in THE CHAUTAUQUAN for November, thus fixing the period to which each author belongs. Care has been taken in selecting the extracts to choose only from those who are in the first rank, and omit all minor writers. The selections are intended to show the style of each, and the lines of thought which he followed.

P. 132, c. 2.—“Würzburg,” wurts'burg. A city of Bavaria on the Main, whose history dates back to the sixth century.

“Minster.” The word comes from the Latin *monasterium*, and is applied to the church or chapel belonging to a monastery; also, as here, to a cathedral.

“War of Wartburg.” In 1206 the landgrave, Hermann I., summoned the poets of his nation to a musical tournament in the castle of Wartburg, in the Thuringian Forest. The competition ran so high that it was called the Wartburg war, and in 1300, a poem, “The War of Wartburg,” appeared, celebrating the event.

P. 134, c. 1.—“Luther.” The value of Luther's literary work can not be estimated. As a poet, his hymns have won him a permanent place. Beside his original verses, he re-arranged and set to music many of the Psalms, thus really founding the church music of Germany. His translation of the Bible must be counted his most important work; but beside this he left a mass of sermons, theses, tracts and controversial writings which, at the time of their writing, wielded wide influence. These latter show most plainly the fiery spirit of their author, his clear conceptions of truths, and his pure style. Special attention should be called to his “Table Talk,” which contains numberless short and pithy statements of his opinions, and to his Catechism on the Decalogue, Apostles' Creed, and the Lord's Prayer.

P. 134, c. 2.—“Nathan the Wise.” This was Lessing's last drama, and was written to show his own religious views and to advocate the wide toleration in which he believed. The three chief characters, Nathan a Jew, Saladin a Mohammedan, and a Christian are thrown together, and their association causes a strong friendship in spite of their diverse views. They practice the utmost charity toward each other. The story of the “Three Rings” contains the point of the drama. It is taken from an old Italian novel.

READINGS IN ART.

P. 142, c. 1.—“Nicolo Pisano,” pe-sā'no. (1200?–1278?) His architectural works are also important, he having designed churches for Padua, Venice and Florence, and a campanile for Pisa.

“Pisa,” pee'sā. A city of Italy, west of Florence, on the river Arno. Its cathedral contains much fine art.

“Siena,” sī-en'nā. A city of Tuscany, south of Florence.

“St. Dominic,” dōm'i-nik. (1170–1221.) The founder of the order of “preaching friars.”

“Bologna,” bo-lon'yā. An Italian city at the foot of the Apennines, and north of Florence.

“Andrea Orcagna,” or-kān'yā. (1299–1389.) The son of a Florentine sculptor who instructed him in art. His surname, Orcagna, is said to have been a corruption of L'Archagnuolo (the Archangel). His fame as a painter and architect was equal to that as a sculptor.

“San Michele,” mī-kā'la. The churches of Italy are almost without exception named after the saint to which they are dedicated, as in this case, San Michele, after St. Michael.

“Giotto,” jōt'ō. (1276–1336.) He was born near Florence, and brought up a shepherd lad. While tending his sheep it is said that a Florentine painter found him drawing on the surface of a rock, and was so convinced of his genius that he took him to Florence to be educated. His talent was so great that he was soon employed in the decoration of the church at Assisi. The details of his life are not known except that he traveled extensively through Italy, being employed in ornamenting many prominent buildings. It is as a painter that Giotto is best known, and as such he did much to awaken art from its unnatural and stiff forms, and to introduce realism. “Campanile,” kām-pa-nē'la.

“Ghiberti,” gee-bēr'tee. (1378–1455.) He learned the trade of a goldsmith, but at that time the goldsmith's art included others, especially designing and coloring. At first Ghiberti was a fresco painter, but was called to sculpture by his success with the bronze doors over which he spent most of his life. “San Giovanni,” jo-vān'nee.

P. 142, c. 2.—“Donatello,” do-nā-tēl'ō. (1383–1466.) He was a native of Florence. One of the Medici became his patron, and he was enabled to apply himself to art. He was a painter of merit as well as a sculptor, and the only one of the age worthy to be ranked with Ghiberti.

“Brunelleschi,” broo-nēl-lēs'kee. (1377–1444.) Better known as an architect than as a sculptor. “Zenobius,” ze-no'bi-us.

“Lucca del Robbia,” del-rob'e-ā. (1400?–1463?) He was trained to the goldsmith's art, but took up sculpture. To him is attributed the interest in porcelain which started in Europe in the fifteenth century. His process of glazing was probably learned from the Saracens, and consisted essentially in using stanniferous (containing tin) enamel. This rendered the terra-cotta work permanent, and gave a white background.

“Uffizi,” oof-fe'tsi. “A palace of Florence whose galleries are among the best of Europe. It contains paintings of all the principal European schools, and many famous statues. There are halls devoted to sculptures of the fifteenth and sixteenth centuries, drawings of the old masters, engravings, ancient bronzes, medals, gems, cameos, intaglios, the whole forming one of the finest collections in the world.” There is also a library in the palace which is rich in manuscript and letters of Italian writers.

“Verrocchio,” vāir'rok'ke-o. (1432–1488.) Of the very little known of Verrocchio, the most interesting fact is that he was the first to take a mould of the human form to aid in designing.

“Leonardo da Vinci,” le-o-nar'do dā vīn'chee. (1452–1519.) A native of Florence. In youth he was recognized as an almost universal genius and speedily surpassed all instructors. He became attached to the court of Milan in 1483 as a musician and improvisatore, and remained there until 1499, when he removed to Florence. About this time he was employed in various cities as an architect and engineer. He went to France in 1515 with Francis I., as court painter, and there died. As a sculptor we have no remains of his work. Vinci was as remarkable a thinker as artist. Hallam says of his literary fragments: “They are like revelations of physical truths vouchsafed to a single mind. The discoveries which made Galileo and Kepler and other names illustrious, the system of Copernicus, the very theories of recent geologies are anticipated by da Vinci, within the compass of a few pages.”

“Contucci,” con-tuk'che. “Sansovino,” sän-so-vee'no. (1460–1529.) Sansovino was a Florentine, and his early works were executed there. Thence he went to Rome and worked, and in 1513 took charge of the Holy House of Loreto, at which he worked until his death.

P. 143, c. 1.—“Loreto,” lo-rā'to. “The Holy House, in which, according to tradition, the Virgin Mary was born, the annunciation and incarnation took place, and the holy family resided on their return from Egypt. The legend is that the house was transported by angels in 1291 from Nazareth to the eastern coast of the Adriatic, and thence in 1294 to the coast of Italy. It is a rudely built brick house, 13½ feet high, with one door and one window. * * * The relics, treasures and offerings of different pilgrims are numerous and valuable. The house is enclosed in a marble casing, which is covered with exquisite sculptures.”

“Buonarroti,” boo-ō'nā-rot'ee. (1475–1563.) A painter, sculptor, and architect. He came from a family of high rank. His artistic genius was early displayed, and he was put under masters to study. Lorenzo de' Medici, pleased with his ability, took him to his palace, where he studied until his patron's death in 1492. He was summoned to Rome by

Julius II., to design his tomb, and in 1508 he began the decoration of the Sistine chapel. When seventy years old he was called upon to take up architecture, and finish St. Peter's, then under way. For the rest of his life he was engaged upon this church, together with several other buildings of Rome. Michael Angelo was not only an artist, but a writer; his sonnets are among the best in any literature.

"Centaur's." Fabulous creatures of mythology—half man and half horse.

"Carrara," kār-rā'rā. A city of northern Italy, which gives its name to a chain of mountains belonging to the Appenines. They contain quarries of fine and valuable marble.

"Giuliano," joo-le-ā'no; "Lorenzo," lo-ren'zo; de' Medici, da mēd'-e-chee. A family distinguished in Florentine history, of which Lorenzo, called The Magnificent (1448-1492), was the most famous member. Giuliano, his brother, was assassinated in 1478, an attempt being made against them both, instigated, some say, by Pope Sixtus IV.

"Modena," mod'e-na; "Bagarelli," bah-gah-rah'lee.

"Padua," pad'u-a; "Riccio," ret'cho. (1480-1532.)

"Tatti," tah'tee. (1479-1570.) Also called Jacopo Sansovino, from his master. Tatti was a Florentine, and worked in his native city and at Rome until 1527, when he went to Venice; there he founded a school and did much work.

"Mars." The Roman god of war, corresponding to the Greek Ares.

"Neptune," nep'tune. In Roman mythology the god of the sea. The Posidon of the Greeks.

P. 143, c. 2.—"Pacher," pa'ker. He lived about 1480.

"Veit Stoss." (1483-1533.) His early labors were in the churches of his native city. The second period of his life was spent in Nuremberg where many of his works remain. Of them it is said: "They are distinguished by a tender fervor and grace, a mild softness of form, and a clearly developed style of relief, with a great deal of life likeness."

"Jörg Syrlin," yürg seer'len. He lived in the latter half of the fifteenth century.

"Riemenschneider," re'men-schn'ter; "Von Schrenburg," fon schren'burg; "Vischer," fish'er. He began his work in 1489, and died 1529.

"Chef d'œuvre," shā-doov'r, masterpiece.

"Regensburg," re'gens-borg. The German name for Ratisbon, a city of Bavaria.

"Apollo," a-pōl'lo. One of the most popular of Greek divinities. Numerous offices were filled by him; he was the god of song and music, of prophecy, of punishment, of protection, and of the sun. Smith says of him: "It may safely be asserted that the Greeks would never have become what they were without the worship of Apollo." And again: "In him the brightest side of the Grecian mind is asserted."

"Orpheus," or'phe-us. "Eurydice," eu-rid'i-ce. Orpheus was a poet and musician of Grecian mythology. His lyre enchanted even the beasts of the field, and the rocks were moved from their places at its sound. His wife, Eurydice, died and was carried to Hades, but Orpheus followed and by the music of his lyre won back his wife on condition that he should not look upon her until they were past the bounds of the infernal regions. His love overpowered him, he turned to see if she followed, only to see her disappear. His grief, it is said, led him to treat the Thracian women with contempt, and he was murdered by them.

"Maximilian," maks-i-mil'yan; "Innsbruck," ins'brook.

"Fontainebleau," fon'tan'blō'. A suburb of Paris, famous for its splendid palace. This palace was begun in the tenth century, and has been added to, remodeled and ornamented by various monarchs since. Its architecture is of all schools, its pictures, statues and books invaluable.

P. 144, c. 1.—"Bernini," bér-nee'nee. He began work for the pope at the age of eighteen, and spent several years on the churches and palaces of Rome. His fame was so great that he was invited to Paris in

1665 to complete the Louvre; but his plans for this were never carried out. His latter life was spent in Italy.

"Alessandro Algardi," al-les-san'dro āl-gar'dee. (1598-1654.) "Pugget," pū'zha'. (1622-1694.) "Girardon," zhe'rar'don'. (1628-1715.) "Houdon," oo'don'. (1741-1828.)

"Pigalle," pe'gal'. (1714-85.) "Duquesnoy," dü'ka'nwā'. (1594-1646.) "Schlüter," schlt'ler. (1662-1714.)

"Winckelman," wīnk'el-mān (1717-1768). A German archæologist. His researches and writings stimulated the interest since taken in archæology, and he is regarded as its founder. Also his theories of the beautiful and "History of Art" opened a new field in German thought.

"Canova," kā-no'vā; "Pompeii," pom-pe'yi; "Herculeum," her'cu-la'ne-um.

"Theseus," the'se-us. A legendary hero of Attica, of whom many wonderful adventures are told. This story of the Minotaur (a monster, half man, half bull,) is that Theseus was taken to Crete along with the youths and maidens which were offered every year to the monster. The king's daughter fell in love with him and gave him a sword with which he killed the Minotaur, and then escaped from the labyrinth in which he was confined, by a thread which he had unraveled as he went in.

"Dannecker," dān'ek-er. (1758-1841.) "Chaudet," sho'da. (1763-1810.) "Thorwaldsen," tor'wawld-sen; "Villa Carlotta," ve'lyā car-lot'a.

"Gutenberg," goo'ten-bérg. (1400?-1468.) The reputed inventor of printing.

"Mayence," mā'yāngs. The French name for Mentz, a city of Hesse on the banks of the Rhine. "Leuchtenberg," loik'ten-bérg.

P. 144, c. 2.—"Schadow," shā'do; "Stettin," stet'teen. A town of Prussia.

"Blucher," bloo'ker; "Naïvete," nā'ev-tā, simplicity, ingenuousness.

"Rauch," rowk; "Bülow," bū'lo; "Scharnhorst," sharn'horst; "Charlottenburg," shar-lut'ten-boorg. A town of Prussia.

"Dürer," dü'rér. (1471-1528.) A German painter and engraver.

P. 145, c. 1.—"Thiergarten," teer'gar-ten. A park in Berlin.

"Schierelbein," she'el-bin; "Dirschau," deer'show. A town of Prussia.

"Rietschel," reet'shel; "Friedenskirche," frē'dens-ker'ka; "Hähnel," hā'nel; "Brühl," brül; "Schwanthaler," shwān'tā-ler; "Bosio," bo'si-o; "Duret," dü'rā'; "Pradier," prā'de-ā'; "Barye," bā're'.

P. 145, c. 2.—"Steinhauser," stīn'how-zer; "Carlsruhe," karls'roo; "Hildebrand," hil'de-brand; "Kessels," kēs'els.

SELECTIONS FROM AMERICAN LITERATURE.

P. 146, c. 1.—"Whately," hwat'li. (1787-1863.) Archbishop of Dublin; author of several important works, chief among which is his "Elements of Logic."

"Thackeray," thāk'e-rī. (1811-1863.) An English novelist.

P. 146, c. 2.—"Steele." (1671-1729.) An English essayist.

"Addison." (1672-1719.) An English poet and essayist.

P. 147, c. 1.—"Benjamins," "a smart coat." It is said to have been so called from a tailor of that name who first made it. Perhaps also from association with the "coat of many colors."

"Purlieu's," pūr'lūs. The outer part of the inn, here. The word means *pure place*, and was first applied to that portion of the forest around the castle which was free or pure from the forest laws; hence it came to mean the outer part of any place.

P. 147, c. 2.—"Plethoric," ple-thor'ic; over-full. "Negus." A drink made from water, wine, sugar, nutmeg, and lemon-juice, and said to have received its name from its first compounder, Colonel Negus.

"Sunnyside." Irving's home on the Hudson, near Tarrytown. The house is an old Dutch mansion. It was near here that Rip Van Winkle lived.

"Eildon Hills," eel'dun. A group of hills in southern Scotland.

BOOKS RECEIVED.

"Putnam's Handy Book Series of Things Worth Knowing." Work for Women, by George J. Manson. New York: G. P. Putnam's Sons, 27 and 29 West Twenty-third Street, 1883.

"The Primer of Politeness." A Help to School and Home Government, by Alex. M. Gow, A.M. Philadelphia: J. B. Lippincott & Co.

"An Introduction to the History of Educational Theories," by Oscar

Browning, M.A. New York: Harper & Brothers, Franklin Square, 1882.

"The Life of Washington and the History of the American Revolution," by Washington Irving. With illustrations. Centennial edition. New York: G. P. Putnam's Sons, 1883.

"Mother Truth's Melodies." Common Sense for Children—A Kindergarten, by Mrs. E. P. Miller. Chicago and New York: Fairbanks, Palmer & Co., 1883.

"The American Girl's Home Book of Work and Play," by Helen Campbell. Illustrated. New York: G. P. Putnam's Sons, 1883.

"Beyond the Gates," by Elizabeth Stuart Phelps. Boston: Houghton, Mifflin & Co., 1883.

"Mary Lamb," by Annie Gilchrist. Boston: Roberts Brothers, 1883.

"Bright and Happy Homes." A Household Guide and Companion, by Peter Parley, Jr. Chicago & New York: Fairbanks, Palmer & Co., 1882.

"Sketches and Anecdotes of American Methodists of 'The Days that Are no More,'" by Daniel Wise, D.D. New York: Phillips & Hunt; Cincinnati: Walden & Stowe, 1883.

"Handbook of Dates." Arranged Alphabetically and Chronologic-

ally. Compiled by Henry Clinton Brown. New York: A. Lovell & Co., 1883.

"Library of Biblical and Theological Literature," edited by George R. Crooks, D.D., and John F. Hurst, D.D. New York: Phillips & Hunt; Cincinnati: Walden & Stowe, 1883.

"Contrary Winds, and Other Sermons," by Wm. M. Taylor, D.D., LL.D. New York: A. C. Armstrong & Son, 1883.

"Arius the Libyan." An Idyl of the Primitive Church. New York: D. Appleton & Co., 1884.

"A Text-Book of Inorganic Chemistry," by Prof. Victor von Richter. Authorized translation of the third German edition, by Edgar F. Smith, A.M., Ph.D. Philadelphia: P. Blakiston, Son & Co., 1883.

"Holland and Its People," by Edmondo De Amicis. Translated from the Italian by Caroline Tilton. Fifth edition. New York: G. P. Putnam's Sons.

"All Aboard for Sunrise Lands." A Trip through California, Across the Pacific to Japan, China and Australia, by Edward A. Rand. Illustrated. New York and Chicago: Fairbanks, Palmer & Co., 1883.

"Summer Rambles in Europe," by Alex. Clark. New York: Nelson & Phillips, publishers, 1879.

INTERMEDIATE NORMAL CLASS.*

PRIZE PAPERS.

Mary D. Coles, 1st prize, 1367 Frankford Avenue, Phila., Pa.
Dr. John A. Steven, 2d prize, 164 High street, Hartford, Conn.

Wm. B. Stevenson, 3d prize, Leech's Corners, Mercer Co., Pa.

DESERVING SPECIAL MENTION.

Mrs. Mary W. Clark, West Brattleboro, Vt.

Anna C. Cobb, 1001 Fourth Avenue, New York.

Mary A. Lilley, Ypsilanti, Mich.

John L. Lowes, Canonsburg, Pa.

Anna M. Poppins, New Wilmington, Pa.

Nellie H. Skidmore, Fredonia, N. Y.

Emilie E. Streeter, W. Brattleboro, Vt.

Junia D. Uart, Dayton, O.

ADDITIONAL PAPERS.

Emma L. Abbott, 3 Linden St., Provisena, R. I.

Mrs. W. C. Armor, Bradford, McKean Co., Pa.

Ida A. Baker, Hydetown, Pa.

Hattie Bierbower, 120 Chestnut St., Evansville, Ind.

Mrs. H. R. Blaisdell, Paris, Ky.

Ray B. Borden, Merchantville, N. J.

Clara J. Brown, Morning Sun, O.

Mrs. Vinolia A. Brown, Morning Sun, O.

Martha Buck, Carbondale, Ill.

E. W. Bushnell, Springfield, O.

Lizzie A. Call, Stafford, Gen. Co., N. Y.

Mrs. Hattie E. Chambers, Bradford, Pa.

Rev. H. L. Crumley, 29 E. Pine St., Atlanta, Ga.

Mary Dayton, 109 N. Chapin St., Binghamton, N. Y.

Mrs. H. M. S. Dithridge, Tionesta, Forest Co., Pa.

Harriet E. Elder, 1128 S. Michigan St., South Bend, Ind.

Ruie M. Ely, Bantam, Clermont Co., O.

Alice C. Ennig, Ennigsville, York Co., Pa.

Flora A. Ennig, Ennigsville, York Co., Pa.

Mary J. Ennig, Ennigsville, York Co., Pa.

Martha J. Evarts, Clarendon, N. Y.

Emma L. Firth, Titusville, Pa.

W. J. Fischer, Box 384, Alton, Ill.

Alice Foster, Leech's Corners, Mercer Co., Pa.

Rev. James M. Foster, Leech's Corners, Mercer Co., Pa.

Jennie Foster, Leech's Corners, Mercer Co., Pa.

Mrs. Albert Gleaves, Evansville, Ind.

Ida E. Goodrich, Geneva, O.

Rev. W. H. Groves, Fayetteville, Tenn.

Miriam J. Guernsey, Canton, Pa.

Lizzie Heald, Moline, Ill.

Mary Herring, Tecumseh, Mich.

Emma K. Hine, Poland, O.

Cora J. Hoover, Flushing, Mich.

Myrtie C. Hudson, Ann Arbor, Mich.

Jennie H. Hunt, Olean, N. Y.

Arthur Hutchinson, Holley, N. Y.

Juliet W. Jennings, Ashtabula, O.

Maria R. Jones, Meriden, Conn.

Anna M. Lane, Liberty Falls, N. Y.

Mrs. O. S. Ludlow, Parma, Mich.

Sadie Lyle, 37 Liberty Street, Allegheny, Pa.

Emma L. Manchester, 247 Friendship St., Providence, R. I.

Jennie E. Martin, West Henrietta, N. Y.

Mrs. Ada T. McCollin, Sugar Grove, Pa.

Mina B. McCollister, Col. Inst., Ft. Edward, N. Y.

Amelia McGranahan, Kennard, Pa.

Maria McKitterick, Burlington, Iowa.

Sarah A. Mie, 267 Delaware Ave., Buffalo, N. Y.

Addie B. Morgan, Stapleton, Richmond Co., N. Y.

Mrs. C. O. Norris, W. Farmington, O.

Nellie M. Norris, W. Farmington, O.

Bartie Page, Frewsburg, Chautauqua Co., N. Y.

Mrs. M. E. Page, Frewsburg, Chautauqua Co., N. Y.

M. R. Palmer, 1011 Up. 6th St., Evansville, Ind.

Mrs. P. P. Pinney, Clarion, Pa.

Lucie A. Pooley, Bridgeville, Pa.

Mary C. Robinson, Albion, Mich.

Nannie M. Schenck, Osage City, Kansas.

Mary Scotten, Great Bend Village, Pa.

Mrs. Josiah Smith, Jeffersonville, N. Y.

Mrs. Rev. Wm. Smith, Howell, Mich.

Mary A. Sowers, Carbondale, Ill.

Rev. Orange H. Spoor, Charlotte, Mich.

Mary Stevenson, Leech's Corners, Mercer Co., Pa.

Mrs. M. S. Stephenson, Herridon, Va.

Kittie M. Thorpe, Napoli, Cattaraugus Co., N. Y.

Mrs. Flora A. Wachter, St. Petersburg, Pa.

Minnie Ware, Stapleton, Richmond Co., N. Y.

Margaret A. Watts, 13th and Main Sts., Louisville, Ky.

Mattie R. Weaver, Latrobe, Pa.

Ella C. Webster, Tecumseh, Mich.

Mattie Wilcox, Chautauqua, N. Y.

Mrs. S. T. Williams, Sheffield, Pa.

Mrs. A. R. Worth, Indianola, Iowa.

This powder never varies. A marvel of purity, strength and wholesomeness. More economical than the ordinary kinds, and can not be sold in competition with the multitude of low test, short weight, alum or phosphate powders. Sold only in cans. ROYAL BAKING POWDER CO., 106 Wall Street, New York.

*The list of names belonging to the Intermediate Normal Class should have been inserted in THE CHAUTAUQUAN for November.

JANUARY.

GERMAN HISTORY.

By REV. W. G. WILLIAMS, A.M.

IV.

The C. L. S. C. student is already aware that it is not pretended here to write the history of Germany, but properly these are entitled "Readings in German History." To write with any degree of fulness or detail the history of a people which has played so large and important a part in the modern world, would require more volumes than are the pages allotted to us. It has been, and still remains the design to select those events and characters of greatest interest, and which have had the largest influence upon the current of subsequent history. The purpose, also constantly in view, has been to stimulate the reader to further study of the subject, by perusal of the best works accessible to the reader of English.

In this number no choice is left us but to pass, with only a glance or two, over the long period from the death of Charlemagne to that day-dawn of modern history, the Reformation. It is the period in which the historian traces, successively the beginning, vicissitudes, decay and extinction of the Carlovigian, Saxon, Franconian and Hohenstauffen houses. Following these is the great interregnum which precedes the Reformation. Included in this long stretch of time are what is known as the "dark ages." Yet in Germany it was not all darkness, for now and then a ray of light was visible, prophetic of the rising sun, which heralded by Huss, appeared in the person and achievements of Martin Luther. It is about the work and character of the latter personage that we purpose to make the chief part of this chapter. Especially are we disposed so to do, now that protestant christendom is celebrating the four hundredth anniversary of the birth of the great reformer, and all civilized mankind has its attention called to his bold doctrines and brave career.

But, before we are prepared for Luther, we must note the change which has come in the claims and pretensions of the church. The different attitude which made possible a few centuries later, such a mission as Luther's can not better be exhibited than during the reign of the Franconian Emperor, Henry the Fourth.

HENRY THE FOURTH—HIS SUPPLIANT VISIT TO CANOSSA.

The student of the history of the Romish church⁹ is aware that during the first five centuries after Christ the pope was vested with little, if any, other powers or dignities than those which pertained to him as Bishop of Rome. His subsequent claim to unlimited spiritual and political sway was then unthought of, much less anywhere advanced. Even for another five centuries he is only the nominal head of the church, who is subordinate to the political potentates and dependent upon them for protection and support in his office. But in the year 1073 succeeded one Gregory VII., to the tiara, who proposed to erect a spiritual empire which should be wholly absolved from dependency on kings and princes. His pontificate was one continuous struggle for the success of his undertaking. Of powerful will, great energy and shrewdness and with set purpose his administration wrought great change in the papal office and the relations of the church to European society. His chief measures by which he sought to compass his design were the celibacy of the priesthood and the suppression of the then prevalent custom of simony. The latter bore especially hard on the German Emperor, much of whose strength lay in the power to appoint the bishops and to levy assessments upon them when the royal exchequer was in need. In the year 1075 Gregory proclaimed his law against the custom, forbidding the sale of all offices of the church, and declaring that none but the pope might appoint bishops or confer the symbols of their authority. With an audacity unheard of, and a determination little anticipated, he sent word to Henry IV., of Germany, demanding the enforcement of the rule throughout his dominion under penalty of excommunication. The issue was a joint one, and a crisis inevitable. No pope had ever assumed such an attitude or used such language to a German Emperor. Henry was not disposed and resolved not to submit. So far as a formal disposition of the difficulty was concerned the case was an easy one. He called the bishops together in a synod which met at Worms. They proceeded with unanimity to declare Gregory deposed from his papal office and sent word of their action to Rome. The pope, who had used every artifice to gain popularity with the people, was prepared for the contest and answered back with the ban of excommunication. The emperor might have been able to carry on the struggle with some hope of success had he been in favor with his own subjects. But he had alienated the Saxons by his harsh treatment of them and the indignities heaped upon them; and others of his states looked upon him with suspicion. Pitted against the ablest foe in Europe, he found himself without the sympathy and aid of those to whom alone he could look for help. Meanwhile Gregory was sending his agents to all the courts of Europe and employing every intrigue to effect the emperor's dethronement. In 1076 a convention of princes was called to meet near Mayence, Henry not being permitted to be present. So heavy had the papal excommunication fallen by this time that the emperor sent messengers to this convention offering to submit to their demands if they would only spare his crown. Gregory was inexorable, and they adjourned without any reconciliations being effected, to meet in a few months at Augsburg. Henry

now realized the might of the hand that for centuries had been silently gathering the reins of spiritual power, only to grasp at last the political supremacy as well. With the burden of excommunication ready to crush out his imperial scepter he sued for pardon at any price. The pope had retired for a time to the castle of Canossa, not far from Parma. Thither went the Franconian Emperor of Germany to implore the papal forgiveness. He presented himself before the gate barefoot, clad in a shirt of sack-cloth, and prayed that he might be received and forgiven as a penitent sinner. But Gregory chose to prolong the satisfaction he had in witnessing his penitence. So throughout the whole day, without food, in snow and rain, he stood begging the pope to receive him. In the same condition and without avail, he stood the second and the third day. Not until the morning of the fourth day did the pope admit him, and then his pardon was granted on conditions which made his crown, for the time, a dependency of the Bishop of Rome.

But the struggle of the German rulers with popedom was not ended at Canossa. Henry himself renewed it a few years later with far better results to his side. The spirit of protestantism was ever alive in some form in Germany, and, as we have said, was prophetic of him who should rise in the fifteenth century and dare to protest against the claim of spiritual supremacy by the autocrat of Rome. From that time till now it has been a by-phrase with German princes in their conflicts with the church that they "will not go to Canossa."

BEFORE THE REFORMATION.

At this time superstition and dense ignorance were widespread. Stories of magic were constantly told and believed, and the miracles with which the church offset them were hardly less absurd. Other terrors were added. Public justice was administered so imperfectly that private and arbitrary violence took its place; while the tribunals which formerly sat in the open sunlight before the people now covered themselves with night and secrecy. "The Holy Feme" sprang up in Westphalia. Originally a public tribunal of the city, such as is found in Brunswick, and in other places, it afterward spread far and wide, but in a changed form. Its members held their sessions in secret and by night. Unknown messengers of the tribunal summoned the accused. Disguised judges, volunteer officers, from among "the knowing ones," gave judgment, often in wild, desolate places, and often in some ancient seat of justice, as at the Linden-tree at Dortmund. The sentence was executed, even if the criminal had not appeared or had made his escape. The dagger, with the mark of the Feme, found in the dead body, told how surely the avenging arm had struck in the darkness. It was a fearful time, when justice, like crime, must walk in disguise.

The habits of thought which made possible such beliefs and actions as these were part of the same movement to which the corruption of church doctrine and government must also be referred. The perverted Roman Christianity from which the Reformation was a revolt was not the Christianity of Charlemagne, nor even that of Hildebrand. Hasty readers sometimes imagine that the church, for many centuries before the Reformation, had firmly held the doctrines which Luther rejected. But, in fact, most of them were recent innovations. Peter the Lombard, Bishop of Paris in the twelfth century, was the first theologian to enumerate "the Seven Sacraments," and Eugene IV., in 1431, was the first of the popes to proclaim them. The doctrine of transubstantiation was first embodied in the church confession by the Lateran Council of November, 1215, the same which first required auricular confession of all the laity. It was more than a century later before the celibacy of the clergy and the denial of the sacramental cup to all but priests became established law, and the idea that the pope is the vicar of Christ upon earth, and the bearer of divine honors, was accepted. All these corruptions of the earlier faith were the results of ambition in the hierarchy, and of gross and sensual modes of thought in the people; and the same causes led to the rapid

development, in the fifteenth century especially, of the worship of the Virgin Mary, who was honored with ceremonies and prayers from which Christians of earlier ages would have shrunk as blasphemous. Nor can the church of the beginning of the sixteenth century be understood by studying the confession adopted by the Council of Trent a generation or more afterward. The teachings and practices which called forth Luther's protest were far too gross, when once explained, to bear the examination of sincere friends of Romanism; who, without knowing it themselves, were greatly influenced, even in their formal statements of belief, by the controversies of the Reformation. The value of that great event to the world can not be comprehended without a knowledge of what it has done for the Catholic church within its own boundaries.*

PREPARING FOR THE REFORMATION.

Prior to the fourteenth century all learning was monopolized by the church. Its power was exercised to make every branch of knowledge harmonize itself with the teachings of Catholic Christianity. In revolt against these shackles arose a few independent spirits who sought to rest religious doctrine on the foundations of reason to some degree, at least. Nevertheless, superstitions still clung to and mingled with all these new studies, and the age did not witness their separation. The higher intelligence traveled gradually, but very slowly. The art of printing came to its assistance and proved to be its strongest auxiliary. To Germany belongs the glory of this invention, and she can boast no higher service rendered to mankind. The art of wood-engraving was the preliminary step which led to it. It was soon employed for pictures of sacred scenes and persons; so that the many who could neither read nor write had a sort of Bible in their picture collections. But the grand conception of making movable types, each bearing a single letter, and composing the words of them, was first formed by John Gutenberg, of the patrician family of Gänsefleisch, of Mayence. He was driven from his native city by a disturbance among the guilds, and went to Strasburg, where he invented the art of printing about the year 1450. Great trouble was experienced in discovering the proper material in which to cut the separate letters; neither wood nor lead answered well. Being short of resources, Gutenberg formed a partnership with John Faust, also of Mayence. Faust's assistant, Peter Schöffer, afterward his son-in-law, a skillful copyist and draughtsman, discovered the proper alloy for type-metal, and invented printing-ink. In 1461 appeared the first large book printed in Germany, a handsome Bible, exhibiting the perfection that the art possessed at its very origin.

When Adolphus of Nassau captured Mayence in 1462, the workmen skilled in the art, which had been kept a secret, were scattered through the world; and by the end of the fifteenth century the principal nations of Europe, and especially Italy, France, and England, had become rivals of Germany in prosecuting it. Books had previously been transcribed, chiefly by monks, upon expensive parchment, and often beautifully ornamented with elaborate drawings and paintings. They had therefore been an article of luxury, and confined to the rich. But a book printed on paper was easily made accessible to all classes, for copies were so numerous that each could be sold at a low price. Beside books of devotion, the writings of the Greek and Latin poets, historians and philosophers, most of which had fallen into oblivion during the Middle Ages, now gradually obtained wide circulation. After the fall of Constantinople, and the subjugation of Greece by the Turks, fugitive Greeks brought the works of their forefathers' genius to Italy, where enlightened men had already begun to study them. This branch of learning, called "the Humanities," spread from Italy through Germany, France, England, and other countries, and contributed powerfully to produce a finer taste and more intelligent habits of thought, such as put to shame the rude ig-

*Lewis.

norance of the monks. It was the art of printing that broke down the slavery in which the blind faith of the church held the human mind; and even the censorship which Rome set up to oppose it was not able to undo its work.

Just as the convents fell before the art of printing, so did the castles of the robber knights before the invention of gunpowder. Thus, at the coming of the Reformation, these degenerate remnants of the once noble institutions of knighthood were swept away. It is supposed by many that the knowledge of gunpowder was brought into Europe from China during the great Mongolian emigration of the thirteenth century, the Chinese having long possessed it. The Arabs, too, understood how to make explosive powder, by mixing saltpeter, charcoal, and sulphur. But all the Eastern makers produced only the fine powder, and the art of making it in grains seems to have been the device of Berthold Schwarz, a German monk of the Franciscan order, of Freiburg or Mayence, in 1354; and he is commonly called the inventor of gunpowder. He had a laboratory, in which he devoted himself to alchemy; and is said to have made his discovery by accident. But as early as 1346, a chronicle reports that there was at Aix "an iron barrel to shoot thunder;" and in 1356 the armory at Nuremberg contained guns of iron and copper, which threw missiles of stone and lead. One of the earliest instances in which cannon are known to have been effectively used in a great battle was at Agincourt in 1415. But gunpowder was long regarded with abhorrence by the people, and made its way into general use but slowly.*

MARTIN LUTHER.

Martin Luther was born at Eisleben on the 10th of November, 1483, on the eve of St. Martin's day, in the same year as Raphael, nine years after Michael Angelo, and ten after Copernicus. His father was a miner and possessed forges in Mansfield, the profits of which enabled him to send his son to the Latin school of the place. There Martin distinguished himself so much that his father intended him for the study of law. In the meantime Martin had often to go about as one of the poor choristers singing and begging at the doors of charitable people at Magdeburg and at Eisenach, to the colleges of which towns he was successively sent. His remarkable appearance and serious demeanor, his fine tenor voice and musical talent procured him the attention and afterward the support and maternal care of a pious matron, into whose house he was taken. Already, in his eighteenth year, he surpassed all his fellow-students in knowledge of the Latin classics, and in power of composition and of eloquence. His mind took more and more a deeply religious turn; but it was not till he had been two years studying at Eisenach that he discovered an entire Bible, having until then only known the ecclesiastical extracts from the sacred volume and the history of Hannah and Samuel. A dangerous illness brought him within the near prospect of death; but he recovered and tried hard to obtain inward peace by a pious life and the greatest strictness in all external observances.† He then determined to renounce the world, and in spite of the strong opposition of his father, became a monk of the Augustine order of Erfurt. But in vain; he was tormented by doubt, and even by despair, until he turned again to the Bible. A zealous study of the exact language of the gospels gave him not only a firm faith, but a peace and cheerfulness which was never afterward disturbed by trials or dangers.‡

In the year 1508 the elector of Saxony nominated him professor of philosophy in the university of Wittenberg; and in 1509 he began to give biblical lectures. These lectures were the awakening cause of new life in the university, and soon a great number of students from all parts of Germany gathered round Luther. Even professors came to attend his lectures and hear his preaching. The year 1511 brought an apparent

interruption, but in fact only a new development of Luther's character and knowledge of the world. He was sent by his order to Rome on account of some discrepancies of opinion as to its government. The tone of flippant impiety at the court and among the higher clergy of Rome shocked the devout German monk. He then discovered the real state of the world in the center of the Western church. He returned to the university and took the degree of Doctor of Divinity at the end of 1512. The solemn oath he had to pronounce on that occasion, "to devote his whole life to study, and faithfully expound and defend the Holy Scripture," was to him the seal of his mission. He began his biblical teaching by attacking scholasticism, at that time called Aristotelianism. He showed that the Bible was a deeper philosophy. His contemporaries praised the clearness of his doctrine. Christ's self-devoted life and death was its center; God's eternal love to mankind, and the sure triumph of Faith, were his texts.*

SALE OF PAPAL INDULGENCES—LUTHER'S RESISTANCE.

In the year 1517, the pope, Leo X., famous both for his luxurious habits and his love of art, found that his income was not sufficient for his expenses, and determined to increase it by issuing a series of absolutions for all forms of crime, even perjury, bigamy and murder. The cost of pardon was graduated according to the nature of the sin. Albert, Archbishop of Mayence, bought the right of selling absolutions in Germany, and appointed as his agent a Dominican monk of the name of Tetzel. The latter began traveling through the country like a peddler, publicly offering for sale the pardon of the Roman church for all varieties of crime. In some places he did an excellent business, since many evil men also purchased pardons in advance for the crimes they *intended* to commit; in other districts Tetzel only stirred up the abhorrence of the people, and increased their burning desire to have such enormities suppressed.

Only one man, however, dared to come out openly and condemn the papal trade in sin and crime. This was Dr. Martin Luther, who, on the 31st of October, 1517, nailed upon the door of the church at Wittenberg a series of ninety-five theses, or theological declarations, the truth of which he offered to prove, against all adversaries. The substance of them was that the pardon of sins came only from God, and could only be purchased by true repentance; that to offer absolutions for sale, as Tetzel was doing, was an unchristian act, contrary to the genuine doctrines of the church; and that it could not, therefore, have been sanctioned by the pope. Luther's object, at this time, was not to separate from the church of Rome, but to reform and purify it.

The ninety-five theses, which were written in Latin, were immediately translated, printed, and circulated throughout Germany. They were followed by replies, in which the action of the pope was defended; Luther was styled a heretic, and threatened with the fate of Huss. He defended himself in pamphlets, which were eagerly read by the people; and his followers increased so rapidly that Leo X., who had summoned him to Rome for trial, finally agreed that he should present himself before the Papal Legate, Cardinal Cajetan, at Augsburg. The latter simply demanded that Luther should retract what he had preached and written, as being contrary to the papal bulls; whereupon Luther, for the first time, was compelled to declare that "the command of the pope can only be respected as the voice of God, when it is not in conflict with the Holy Scriptures." The Cardinal afterward said: "I will have nothing more to do with that German beast, with the deep eyes and the whimsical speculations in his head!" and Luther said of him: "He knew no more about the Word than a donkey knows of harp-playing."

The Vicar-General of the Augustines was still Luther's friend, and, fearing that he was not safe in Augsburg, he had him let

*Lewis.

†Bunsen.

‡Taylor.

*Bunsen.

out of the city at daybreak, through a small door in the wall, and then supplied with a horse. Having reached Wittenberg, where he was surrounded with devoted followers, Frederick the Wise was next ordered to give him up. About the same time Leo X. declared that the practices assailed by Luther were doctrines of the church, and must be accepted as such. Frederick began to waver; but the young Philip Melancthon, Justus Jonas, and other distinguished men connected with the university exerted their influence, and the elector finally refused the demand. The Emperor Maximilian, now near his end, sent a letter to the pope, begging him to arrange the difficulty, and Leo X. commissioned his Nuncio, a Saxon nobleman named Karl von Miltitz, to meet Luther. The meeting took place at Altenburg in 1519; the Nuncio, who afterward reported that he "would not undertake to remove Luther from Germany with the help of 10,000 soldiers, for he had found ten men for him where one was for the pope"—was a mild and conciliatory man. He prayed Luther to pause, for he was destroying the peace of the church, and succeeded, by his persuasions, in inducing him to promise to keep silence, provided his antagonists remained silent also.

This was merely a truce, and it was soon broken. Dr. Eck, one of the partisans of the church, challenged Luther's friend and follower, Carlstadt, to a public discussion in Leipzig, and it was not long before Luther himself was compelled to take part in it. He declared his views with more clearness than ever, disregarding the outcry raised against him that he was in fellowship with the Bohemian heretics. The struggle, by this time, had affected all Germany, the middle class and smaller nobles being mostly on Luther's side, while the priests and reigning princes, with a few exceptions, were against him. In order to defend himself from misrepresentation and justify his course, he published two pamphlets, one called "An Appeal to the Emperor and Christian Nobles of Germany," and the other "Concerning the Babylonian Captivity of the Church." These were read by tens of thousands, all over the country.

Pope Leo X. immediately issued a bull, ordering all Luther's writings to be burned, excommunicating those who should believe in them, and summoning Luther to Rome. This only increased the popular excitement in Luther's favor, and on the 10th of December, 1520, he took the step which made impossible any reconciliation between himself and the papal power. Accompanied by the professors and students of the university, he had a fire kindled outside of one of the gates of Wittenberg, placed therein the books of canonical law and various writings in defence of the pope, and then cast the papal bull into the flames, with the words: "As thou hast tormented the Lord and His saints, so may eternal flame torment and consume thee." This was the boldest declaration of war ever hurled at such an overwhelming majority; but the courage of this one man soon communicated itself to the people. Frederick the Wise was now his steadfast friend, and, although the dangers which beset him increased every day, his own faith in the righteousness of his cause only became firmer and purer.*

LUTHER AT WORMS.

Meanwhile Charles of Spain had succeeded Maximilian and became Karl V. in the list of German emperors. Luther wrote to the new emperor asking that he might be heard before being condemned. The elector Frederick also interceded, and the diet of Worms was convened January 6, 1521. Luther was summoned to appear. "I must go; if I am too weak to go in good health, I shall have myself carried thither sick. They will not have my blood after which they thirst unless it is God's will. Two things I can not do—shrink from the call, nor retract my opinions." The emperor tardily granted him the safe conduct on which his friends insisted. In spite of all warnings he set out with the imperial herald on the 2nd of April. On the 16th he entered the city. On his approach to Worms the

elector's chancellor entreated him in the name of his master not to enter a town where his death was already decided. Luther returned the simple reply, "Tell your master that if there were as many devils at Worms as tiles on its roofs, I would enter." When surrounded by his friends on the morning of the 17th, on which day he was to appear before the august assembly, he said, "Christ is to me what the head of the gorgon was to Perseus; I must hold it up against the devil's attack." When the hour approached he fell on his knees and uttered in great agony a prayer such as can only be pronounced by a man filled with the spirit of him who prayed at Gethsemane. He rose from prayer, and followed the herald. Before the throne he was asked two questions, whether he acknowledged the works before him to have been written by himself, and whether he would retract what he had said in them. Luther's address to the emperor has been preserved, and is a masterpiece of eloquence as well as of courage. The following is a part of his words: "I have laid open the almost incredible corruptions of popery, and given utterance to complaints almost universal. By retracting what I have said on this score, should I not fortify rank tyranny, and open a still wider door to enormous impieties? I can only say with Jesus Christ, 'If I have spoken evil, bear witness of the evil.'" Addressing himself directly to the emperor, he said: "May this new reign not begin, and still less continue, under pernicious auspices. The Pharaohs of Egypt, the kings of Babylon and of Israel never worked more effectually for their own ruin than when they thought to strengthen their power. I speak thus boldly, not because I think such great princes want my advice, but because I will fulfill my duty toward Germany as she has a right to expect from her children." The contemptible emperor, seeing his physical exhaustion, and thinking to confound him, ordered him to repeat what he had said in Latin. Luther did so. It was, however, when again urged to retract that we witness what seems the highest point of moral sublimity in Luther's career. "I can not submit my faith either to the pope or to councils, for it is clear that they have often erred and contradicted themselves. I will retract nothing unless convicted by the very passages of the word of God which I have just quoted." And he concluded by saying: "Here I take my stand. I can not do otherwise: so help me God. Amen."*

From that day Luther's life was in greatest and constant danger. The papal dogs had scented the blood of a heretic, and were on his track. Leaving Worms, he was seized by friends under the guise of enemies, as he was passing through the Thuringian forest, and carried away and hid in the castle of Wartburg. Here, secreted from his enemies for many months, he busied himself with translating the New Testament into German. His version proved to be among the most valuable of the services he rendered. In many respects it is superior to any other translations yet made. With all his scholarship, he ignored the theological style of writing, and sought to express the thoughts of the inspired writers in words comprehensible by the commonest people. To this end he frequented the marketplace, the house of sorrow, and of rejoicing, in order to note how the people expressed themselves in all the circumstances of life. "I can not use the words heard in castles and courts," he said; "I have endeavored in translating to give clear, pure German."

Luther lived twenty-five years after the diet of Worms—years of heroic battle, sometimes against foes inside of his movement of reform as well as against the church, which never gave up the struggle. He wrote many works, some controversial, others expository of the Bible. His "Battle Hymn" also revealed him the possessor of rare poetic genius.

He died at Eisleben, February 17, 1546. For some time, under the weight of his labors and anxieties, his constitution had been breaking down. The giant of the Reformation halted

*Taylor.

*Dunstan.

in his earthly course, but the gigantic spirit and work moved on. As the solemn procession which bore his body from Eisleben to Wittenberg passed, the bells of every village and town were tolled, and the people flocked together, crowding the highways. At Halle men and women came out with cries and lamentations, and so great was the throng that it was two hours before the coffin could be laid in the church. An eye-witness says: "Here we endeavored to raise the funeral psalm, 'Out of the depths have I called unto thee,' but so heavy was our grief that the words were wept rather than sung." Mr. Carlyle closes his "Spiritual Portrait of Luther" with the following words of noble and beautiful tribute: "I call this Luther a true great man; great in intellect, in courage, affection and integrity; one of our most lovable and precious men. Great, not as a hewn obelisk, but as an Alpine mountain—so simple, honest, spontaneous, not setting up to be great at all; there for quite another purpose than being great! Ah yes, unsubduable granite, piercing far and wide into the heavens; yet in the clefts of it fountains, green, beautiful valleys with flowers! A right spiritual hero and prophet; once more, a true son of nature and fact, for whom these centuries, and many that are to come yet, will be thankful to heaven."

[To be continued.]

EXTRACTS FROM GERMAN LITERATURE.

JOHANN JOACHIM WINCKELMANN.

No critic has displayed a keener feeling for the beauty and significance of such works as came within his knowledge, or a truer imagination in bridging over the gulfs at which direct knowledge failed him. And his style, warm with the glow of sustained enthusiasm, yet calm, dignified, and harmonious, was worthy of his splendid theme.—*Sime.*

More artistic and æsthetic views have prevailed in every direction since Winckelmann became a recognized authority.—*Schlegel.*

The Apollo of the Vatican.

Among all the works of antiquity which have escaped destruction the Apollo of the Vatican reaches the highest ideal of art. It surpasses all other statues as Homer's Apollo does that of all succeeding poets. Its size lifts it above common humanity, and its altitude bespeaks its greatness. The proud form charming in the manliness of the prime of life seems clothed with endless youth.

Go with thy soul into the kingdom of celestial beauty and seek to create within thyself a divine nature, and to fill thy heart with forms which are above the material. For here there is nothing perishable, nothing that mortal imperfection demands. No veins heat, no sinews control this body; but a heavenly spirit spreading like a gentle stream fills the whole figure.

He has foiled the Python against which he has just drawn his bow, and the powerful dart has overtaken and killed it. Satisfied, he looks far beyond his victory into space; contempt is on his lip and the rage which possesses him expands his nostrils and mounts to his forehead. Still the peace which hovers in holy calm upon his forehead is undisturbed; his eye like the eyes of the muses is full of gentleness.

In all the statues of the father of gods which remain to us in none does he come so near to that grandeur in which he has revealed himself to the poets as he does here in the face of his son. The peculiar beauties of the remaining gods are united here in one: the forehead of Jupiter, pregnant with the goddess of wisdom, eyebrows which reveal his will in their arch, the full commanding eyes of the queen of the gods, and a mouth of the greatest loveliness. About this divine head the soft hair, as if moved by a gentle breeze, plays like the graceful tendrils of a vine. He seems like one anointed with the oil of the gods, and crowned with glory by the Graces.

Before this wonderful work of art I forgot all else. My

bosom throbs with adoration as his with the spirit of prophecy. I feel myself carried back to Delos and to the lyric halls, the places which Apollo honored with his presence; then the statue before me seems to receive life and motion like Pygmalion's beauty; how is it possible to paint, to describe it? Art itself must direct me, must lead my hand, to carry out the first outlines which I attempt. I lay my effort at its feet as those who would crown the god-head, but can not attain the height, do their wreaths.

FRIEDRICH VON SCHILLER.

He was a seer—a prophet. A century has passed since his birth, and we revere him as one of the first among the spiritual heroes of humanity.—*Vischer. Speech at the Centenary Festival of Schiller's birthday (1859).*

That Schiller went away early is for us a gain. From his tomb there comes to us an impulse, strengthening us, as with the breath of his own might, and awakening a most earnest longing to fulfill, lovingly, and more and more, the work that he began. So, in all that he willed to do, and in all that he fulfilled, he shall live on, forever, for his own nation, and for mankind.—*Goethe.*

Goethe and Schiller greatly excelled in their department of literary labor, becoming oracles in all such matters. And since their names have gone into history, they share, perhaps not quite equally, the highest niche in the pantheon of German literature. Schiller was, at once, a fine thinker, and poet, able to weave his own subtle thoughts, and the philosophies of other transcendentalists into verse, as exquisite as their speculations were, at times, dreamy and incomprehensible. Carlyle, in a glowing tribute to Schiller, concedes to Goethe the honor of being the poet of Germany; and so perhaps he was, though it is difficult to compare men so widely different. They differed in this: Goethe, with his rich endowment of intellect, was born a poet—an inspired man, the ever springing fountain within him poured forth copiously; Schiller, with genius hardly surpassed, seems a more laborious thinker, ever seeking truth, while his finely wrought stanzas are a little more artificially melodious. He is the most beloved because his countrymen think he had more heart, and breathed out more ardent aspirations for political freedom. We commend what is excellent in his works; the facts and truths expressed with refreshing clearness, and usually of good moral tendency, but we can not ignore his philosophical skepticism, and warn the admiring reader against its pernicious influence. In the supreme matter of religious faith our captivating author was evidently much of his life adrift on stormy seas, "driven of the winds and tossed." If the fatuity of the venture was not followed by dismal and utter shipwreck, he was near the fatal rocks, and suffered great loss. The beginning was in this respect most full of promise, and his environment favorable. The home training in a devout religious family, and the teachings of the sanctuary had made a deep impression on the mind of the thoughtful youth, and as solemn vows were made as ever passed from human lips. His was for a season really a life of prayer and consecration to Christian service. But all that passed away. And how the change was brought about it is not hard to discover. Though blameless in character, and full of noble aspirations while yet in his adolescence, quite too early, he became acquainted with infidel writings of Voltaire—a perilous adventure for any youth. The foundations on which he rested were shaken, and he fled to the positive philosophy of Kant and others, who interpreted away all that was distinctively true and life-giving in the Scriptures. Faith, whose mild radiance brightened the morning, suffered a fearful eclipse before it was noon: and thence, like a wanderer, he groped for the way; "daylight all gone." The great man needed God, but turned from him—sought truth with worshipful anxiety, but, in his sad bewilderment, found it not. The difference between his states of faith and unfaith is strongly stated in his own words that we here give. The first extract

was written on a Sabbath in 1777. The other tells, about as forcibly as words can, of the unrest and disappointment that were afterward felt.

Sabbath Morning.

God of truth, Father of light, I look to thee with the first rays of the morning sun, and I bow before thee. Thou seest me, O God! Thou seest from afar every pulsation of my praying heart. Thou knowest well my earnest desire for truth. Heavy doubt often veils my soul in night; but thou knowest how anxious my heart is within me, and how it goes out for heavenly light. Oh yes! A friendly ray has often fallen from thee upon my shadowed soul. I saw the awful abyss on whose brink I was trembling, and I have thanked the kind hand that drew me back in safety. Still be with me, my God and Father, for there are days when fools stalk about and say, "there is no God." Thou hast given me my birth, O my Creator, in these days when superstition rages at my right hand, and skepticism scoffs at my left. So I often stand and quake in the storm; and oh, how often would the bending reed break if thou didst not prevent it; thou, the mighty Preserver of all thy creatures and Father of all who seek thee. What am I without truth, without her leadership through life's labyrinth? A wanderer through the wilderness overtaken by the night, with no friendly hand to lead me, and no guiding star to show me the path. Doubt, uncertainty, skepticism! You begin with anguish, and you end with despair. But Truth, thou leadest us safely through life, bearest the torch before us in the dark vale of death, and bringest us home to heaven, where thou wast born. O my God, keep my heart in peace, in that holy rest during which Truth loves best to visit us. If I have truth then I have Christ; if I have Christ then have I God; and if I have God, then I have everything. And could I ever permit myself to be robbed of this precious gem, this heaven-reaching blessing by the wisdom of this world, which is foolishness in thy sight? No. He who hates truth will I call my enemy, but he who seeks it with simple heart I will embrace as my brother and my friend.

Later in life his anguish is openly expressed in his philosophical letters. "I felt, and I was happy. Raphael has taught me to think, and I am now ready to lament my own creation. You have stolen my faith that gave me peace. You have taught me to despise what I once revered. A thousand things were very venerable to me before your sorry wisdom stripped me of them. I saw a multitude of people going to church; I heard their earnest worship as they united in fraternal prayer; I cried aloud, 'That truth must be divine which the best of men profess, which conquers so triumphantly and consoles so sweetly.' Your cold reason has quenched my enthusiasm. 'Believe no one,' you said, 'but your reason; there is nothing more holy than truth.' I listened, and offered up all my opinions. My reason is now become everything to me; it is my only guarantee for divinity, virtue, and immortality. Woe unto me henceforth, if I come in conflict with this sole security!"

The following lines are given as a specimen of his verse. They are taken from Carlyle's translation of the "Song of the Alps:"

By the edge of the chasm is a slippery track,
The torrent beneath, and the mist hanging o'er thee;
The cliffs of the mountains, huge, rugged, and black,
Are frowning like giants before thee;
And, would'st thou not waken the sleeping Lawine,
Walk silent and soft through the deadly ravine.

That bridge with its dizzying, perilous span,
Aloft o'er the gulf and its flood suspended,
Think'st thou it was built by the art of man,
By his hand that grim old arch was bended?
Far down in the jaws of the gloomy abyss
The water is boiling and hissing—forever will hiss.

Duty—Fame of.

What shall I do to be forever known?

Thy duty ever.

This did full many who yet slept unknown—

Oh! never, never!

Thinkest thou, perchance, that they remain unknown
Whom *thou* knowest not?
By angel trumpets in heaven their praise is blown,
Divine their lot.

What shall I do to gain eternal life?
Discharge aright
The simple dues with which each day is rife?
Yea, with thy might.
Ere perfect scheme of action thou devise,
Life will be fled,
While he who ever acts as conscience cries
Shall live, though dead.

The following verse is from the oft-recited "Song of the Bell," and is exquisite:

Ah! seeds how dearer far than they
We bury in the dismal tomb,
When hope and sorrow bend to pray,
That suns beyond the realm of day
May warm them into bloom.

JOHANN WOLFGANG GOETHE.

Goethe differs from all other great writers, except perhaps Milton, in this respect, that his works can not be understood without a knowledge of his life, and that his life is in itself a work of art, greater than any work which it created. . . . He is not only the greatest poet of Germany; he is one of the greatest poets of any age. . . . He was the apostle of self-culture.—*Sime.*

A Criticism on the Poems of J. H. Voss.

Every author, in some degree, portrays himself in his works even be it against his will. In this case he is present to us, and designedly; nay, with a friendly alacrity, sets before us his inward and outward modes of thinking and feeling; and disdains not to give us confidential explanations of circumstances, thoughts, views, and expressions, by means of appended notes.

And now, encouraged by so friendly an invitation, we draw nearer to him; we seek him by himself; we attach ourselves to him, and promise ourselves rich enjoyment, and manifold instruction and improvement.

In a level northern landscape we find him, rejoicing in his existence, in a latitude in which the ancients hardly expected to find a living thing.

And truly, winter there manifests his whole might and sovereignty. Storm-borne from the pole, he covers the woods with hoar frost, the streams with ice—a drifting whirlwind eddies around the high gables, while the poet rejoices in the shelter and comfort of his home, and cheerily bids defiance to the raging elements. Furred and frost-covered friends arrive, and are heartily welcomed under the protecting roof; and soon they form a cordial confiding circle, enliven the household meal by the clang of glasses, the joyous song, and thus create for themselves a moral summer.

And when spring herself advances, no more is heard of roof and hearth; the poet is always abroad, wandering on the soft pathways around his peaceful lake. Every bush unfolds itself with an individual character, every blossom bursts with an individual life, in his presence. As in a fully worked-out picture, we see, in the sun-light around him, grass and herb, as distinctly as oak and beech-tree; and on the margin of the still waters there is wanting neither the reed nor any succulent plant.

Around him, like a dweller in Eden, sport, harmless, fearless creatures—the lamb on the meadows, the roe in the forest. Around him assemble the whole choir of birds, and drown the busy hum of day with their varied accents.

The summer has come again; a genial warmth breathes through the poet's song. Thunders roll; clouds drop showers; rainbows appear; lightnings gleam, and a blessed coolness overspreads the plain. Everything ripens; the poet overlooks

none of the varied harvests; he hallows all by his presence.

And here is the place to remark what an influence our poets might exercise on the civilization of our German people—in some places, perhaps, have exercised.

His poems on the various incidents of rural life, indeed, do represent rather the reflections of a refined intellect than the feelings of the common people: but if we could picture to ourselves that a harper were present at the hay, corn, and potato harvests—if we recollected how he might make the men whom he gathered around him observant of that which recurs to them as ordinary and familiar; if, by his manner of regarding it, by his poetical expression, he elevated the common, and heightened the enjoyment of every gift of God and nature by his dignified representation of it, we may truly say he would be a real benefactor to his country. For the first stage of a true enlightenment is, that man should reflect upon his condition and circumstances, and be brought to regard them in the most agreeable light.

But scarcely are all these bounties brought under man's notice, when autumn glides in, and our poet takes an affecting leave of nature, decaying, at least in outward appearance. Yet he abandons not his beloved vegetation wholly to the unkind winter. The elegant vase receives many a plant, many a bulb, wherewith to create a mimic summer in the home seclusion of winter, and, even at that season, to leave no festival without its flowers and wreaths. Care is taken that even the household birds belonging to the family should not want a green fresh roof to their bowery cage.

Now is the loveliest time for short rambles—for friendly converse in the chilly evening. Every domestic feeling becomes active; longings for social pleasures increase; the want of music is more sensibly felt; and now, even the sick man willingly joins the friendly circle, and a departing friend seems to clothe himself in the colors of the departing year.

For as certainly as spring will return after the lapse of winter, so certainly will friends, lovers, kindred meet again; they will meet again in the presence of the all-loving Father; and then first will they form a whole with each other, and with everything good, after which they sought and strove in vain in this piece-meal world. And thus does the felicity of the poet, even here, rest on the persuasion that all have to rejoice in the care of a wise God, whose power extends unto all, and whose light lightens upon all. Thus does the adoration of such a being create in the poet the highest clearness and reasonableness; and, at the same time, an assurance that the thoughts, the words, with which he comprehends and describes infinite qualities, are not empty dreams and sounds, and thence arises a rapturous feeling of his own and others' happiness, in which everything conflicting, peculiar, discordant, is resolved and dissipated.

Faustus.

Faustus. Oh, he, indeed, is happy, who still feels,
And cherishes within himself, the hope
To lift himself above this sea of errors!
Of things we know not, each day do we find
The want of knowledge—all we know is useless:
But 'tis not wise to sadden with such thoughts
This hour of beauty and benignity:
Look yonder, with delighted heart and eye,
On those low cottages that shine so bright
(Each with its garden plot of smiling green),
Robed in the glory of the setting sun!
But he is parting—fading—day is over—
Yonder he hastens to diffuse new life.
Oh, for a wing to raise me up from earth,
Nearer, and yet more near, to the bright orb,
That unrestrained I still might follow him!
Then should I see, in one unvarying glow
Of deathless evening, the reposing world
Beneath me—the hills kindling—the sweet vales,

B-IV-4

Beyond the hills, asleep in the soft beams
The silver streamlet, at the silent touch
Of heavenly light, transfigured into gold,
Flowing in brightness inexpressible!
Nothing to stop or stay my godlike motion!
The rugged hill, with its wild cliffs, in vain
Would rise to hide the sun; in vain would strive
To check my glorious course; the sea already,
With its illumined bays, that burn beneath
The lord of day, before the astonished eyes
Opens its bosom—and he seems at last
Just sinking—no—a power unfelt before—
An impulse indescribable succeeds!
Onward, entranced, I haste to drink the beams
Of the unfading light—before me day—
And night left still behind—and overhead
Wide heaven—and under me the spreading sea!—
A glorious vision, while the setting sun
Is lingering! Oh, to the spirit's flight,
How faint and feeble are material wings!
Yet such our nature is, that when the lark,
High over us, unseen in the blue sky
Thrills his heart-piercing song, we feel ourselves
Press up from earth, as 'twere in rivalry;—
And when above the savage hill of pines,
The eagle sweeps with outspread wings—and when
The crane pursues, high off, his homeward path,
Flying o'er watery moors and wide lakes lonely!

Wagner. I, too, have had my hours of reverie;
But impulse such as this I never felt.
Of wood and fields the eye will soon grow weary;
I'd never envy the wild birds their wings.
How different are the pleasures of the mind;
Leading from book to book, from leaf to leaf,
They make the nights of winter bright and cheerful;
They spread a sense of pleasure through the frame,
And when you see some old and treasured parchments,
All heaven descends to your delighted senses!

FRIEDRICH SCHLEGEL.

His most important work is his "History of Ancient and Modern Literature." Throughout his exposition he is a propagandist of his special ideas; but the book is of lasting importance as the earliest attempt to present a systematic view of literary development as a whole.—*Sime.*

Extracts from History of Literature.

LITERARY INFLUENCE OF THE BIBLE.—On attentively considering the influence exercised by the Bible over mediæval as well as more modern literature and poetry, and the effects of the Scriptures, viewed as a mere literary composition on language, art, and representation, two important elements engage our observation. The first of these is complete simplicity of expression or the absence of all artifice. Almost exclusively treating of God and the moral nature of man, the language of the Scriptures is throughout living and forcible, devoid of metaphysical subtleties and of those dead ideas and empty abstractions which mark the philosophy of all nations—from the Indians and Greeks down to modern Europeans—whenever they undertake to represent those exalted objects of contemplation, God and man, by the light of unassisted reason. . . . Corresponding simplicity or absence of affectation also mark the poetical portions of Holy Writ, notwithstanding the copiousness of noble and sublime passages with which they abound. . . . The second distinctive quality of the Bible, in reference to external form and mode of representation, exerting an immense influence over modern diction and poesy, is the all pervading typical and symbolic element—not only of its poetical but of the didactic and historical books. In the case of the Hebrews this peculiarity may be partially regarded as a national peculiarity, in which the Arabs, their nearest of kin, participated.

It is not impossible that the prohibition concerning graven images of the Divinity contributed to cherish this propensity; the imagination restricted on one side sought an outlet in another. The same results flowed from similar causes among the followers of Mahomet. In those portions of Holy Writ in which oriental imagery is less dominant, as for instance in the books of the New Testament, symbolism nevertheless prevails. This spirit has, to a great extent, influenced the intellectual development of all Christian races.

MEDIAEVAL GOTHIC ARCHITECTURE.—The real mediæval is nowhere so thoroughly expressed as in the memorials of the architectural style erroneously called gothic, the origin of which, as also its progressive features, may, to this day, be said to be lost in obscurity and doubt. The misnomer is now generally admitted, and it is commonly understood that this mediæval style did not originate with the Goths, but sprung up at a later date, and speedily attained its full maturity without exhibiting various gradations of formation. I allude to that style of Christian art which is distinguished by its lofty vaults and arches, its pillars which resemble bundles of reeds, and general profusion of ornament modeled after leaf and flower. . . . Whoever the originators, it is evident that their intention was not merely to pile up huge stone edifices, but to embody certain ideas. How excellent soever the style of a building may be, if it convey no meaning, express no sentiment, it can not strictly be considered a creation of art; for it must be remembered that this, at once the most ancient and sublime of creative arts, can not directly stimulate the feelings by means of actual appeal or faculty of representation. Hence architecture generally bears a symbolical hidden meaning, whilst the Christian architecture of mediæval Germany does so in an eminent and especial degree. First and foremost there is the expression of devotional thought towering boldly aloft from this lowly earth toward the azure skies and an omnipotent God. . . . The whole plan is replete with symbols of deep significance, traced and illustrated in a remarkable manner in the records of the period. The altar pointed eastward; the three principal entrances expressed the conflux of worshipers gathered together from all quarters of the globe. The three steeples corresponded to the Christian Trinity. The quire arose like a temple within a temple on an increased scale of elevation. The form of the cross had been of early establishment in the Christian church, not accidentally, as has been conjectured by some, but with a view to completeness, a constituent part of the whole. The rose will be found to constitute the radical element of all decoration in this architectural style; from it the peculiar shape of window, door and steeple is mainly derived in their manifold variety of foliated tracery. The cross and the rose are, then, the chief symbols of this mystic art. On the whole, what is sought to be conveyed is the stupendous idea of eternity, the earnest thought of death, the death of this world, wreathed in the lovely fullness of an endless blooming life in the world that is to come.

READINGS IN PHYSICAL SCIENCE.*

IV.—THE SEA.

It has been ascertained that water covers about three times more of the earth's surface than the land does. We could not tell that merely by what we can see from any part of this country, or indeed of any country. It is because men have sailed round the world, and have crossed it in many directions, that the proportion of land and water has come to be known.

Take a school-globe and turn it slowly round on its axis. You see at a glance how much larger the surface of water is than the surface of land. But you may notice several other interesting things about the distribution of land and water.

In the first place you will find that the water is all connected together into one great mass, which we call the sea. The land, on the other hand, is much broken up by the way the sea runs into it; and some parts are cut off from the main mass of land, so as to form islands in the sea. Britain is one of the pieces of land so cut off.

In the second place, you cannot fail to notice how much more land lies on the north than on the south of the equator. If you turn the globe so that your eye shall look straight down on the site of London, you will find that most of the land on the globe comes into sight; whereas, if you turn the globe exactly round, and look straight down on the area of New Zealand, you will see most of the sea. London thus stands about the centre of the land-hemisphere, midway among the countries of the earth. And no doubt this central position has not been without its influence in fostering the progress of British commerce.

In the third place, you will notice that by the way in which the masses of land are placed, parts of the sea are to some extent separated from each other. These masses of land are called continents, and the wide sheets of water between are termed oceans. Picture to yourselves that the surface of the solid part of the earth is uneven, some portions rising into broad swellings and ridges, others sinking into wide hollows and basins. Now, into these hollows the sea has been gathered, and only those upstanding parts which rise above the level of the sea form the land.

When you come to examine the water of the sea, you find that it differs from the water with which you are familiar on the land, inasmuch as it is salt. It contains something which you do not notice in ordinary spring or river water. If you take a drop of clear spring water, and allow it to evaporate from a piece of glass, you will find no trace left behind. Take, however, a drop of sea water and allow it to evaporate. You find a little white point or film left behind, and on placing that film under a microscope you see it to consist of delicate crystals of common or sea salt. It would not matter from what ocean you took the drop of water, it would still show the crystals of salt on being evaporated.

There are some other things beside common salt in sea water. But the salt is the most abundant, and we need not trouble about the rest at present. Now, where did all this mineral matter in the sea come from? The salt of the sea is all derived from the waste of the rocks.

It has already been pointed out how, both underground and on the surface of the land, water is always dissolving out of the rocks various mineral substances, of which salt is one. Hence the water of springs and rivers contains salt, and this is borne away into the sea. So that all over the world there must be a vast quantity of salt carried into the ocean every year.

The sea gives off again by evaporation as much water as it receives from rain and from the rivers of the land. But the salt carried into it remains behind. If you take some salt water and evaporate it the pure water disappears, and the salt is left. So it is with the sea. Streams are every day carrying fresh supplies of salt into the sea. Every day, too, millions of tons of water are passing from the ocean into vapor in the atmosphere. The waters of the sea must consequently be getting saltier by degrees. The process, however, is an extremely slow one.

Although sea water has probably been gradually growing in saltiness ever since rivers first flowed into the great sea, it is even now by no means as salt as it might be. In the Atlantic Ocean, for example, the total quantity of the different salts amounts only to about three and a half parts in every hundred parts of water. But in the Dead Sea, which is extremely salt, the proportion is as much as twenty-four parts in the hundred of water.

Standing by the shore and watching for a little the surface of the sea, you notice how restless it is. Even on the calmest summer day, a slight ripple or a gentle heaving motion will be seen.

Again, if you watch a little longer, you will find that whether

*Abridged from Science Primer on Physical Geography, by Prof. Geikie.

the sea is calm or rough, it does not remain always at the same limit upon the beach. At one part of the day the edge of the water reaches to the upper part of the sloping beach; some six hours afterward it has retired to the lower part. You may watch it falling and rising day by day, and year by year, with so much regularity that its motion can be predicted long beforehand. This ebb and flow of the sea forms what are called tides.

If you cork up an empty bottle and throw it into the sea, it will of course float. But it will not remain long where it fell. It will begin to move away, and may travel for a long distance until thrown upon some shore again. Bottles cast upon mid-ocean have been known to be carried in this way for many hundreds of miles. This surface-drift of the sea water corresponds generally with the direction in which the prevalent winds blow.

But it is not merely the surface water which moves. You have learnt a little about icebergs; and one fact about them which you must remember is that, large as they may seem, there is about seven times more of their mass below water than above it. Now, it sometimes happens that an iceberg is seen sailing on, even right in the face of a strong wind. This shows that it is moving, not with the wind, but with a strong under-current in the sea. In short, the sea is found to be traversed by many currents, some flowing from cold to warm regions, and others from warm to cold.

Here, then, are four facts about the sea:—1st, it has a restless surface, disturbed by ripples and waves; 2ndly, it is constantly heaving with the ebb and flow of the tides; 3dly, its surface waters drift with the wind; and 4thly, it possesses currents like the atmosphere.

For the present it will be enough if we learn something regarding the first of these facts—the waves of the sea.

Here again you may profitably illustrate by familiar objects what goes on upon so vast a scale in nature. Take a basin, or a long trough of water, and blow upon the water at one edge. You throw its surface into ripples, which, as you will observe, start from the place where your breath first hits the water, and roll onward until they break in little wavelets upon the opposite margin of the basin.

What you do in a small way is the same action by which the waves of the sea are formed. All these disturbances of the smoothness of the sea are due to disturbances of the air. Wind acts upon the water of the sea as your breath does on that of the basin. Striking the surface it throws the water into ripples or undulations, and in continuing to blow along the surface it gives these additional force, until driven on by a furious gale they grow into huge billows.

When waves roll in on the land, they break one after another upon the shore, as your ripples break upon the side of the basin. And they continue to roll in after the wind has fallen, in the same way that the ripples in the basin will go on curling for a little after you have ceased to blow. The surface of the sea, like that of water generally, is very sensitive. If it is thrown into undulations, it does not become motionless the moment the cause of disturbance has passed away, but continues moving in the same way, but in a gradually lessening degree, until it comes to rest.

The restlessness of the surface of the sea becomes in this way a reflection of the restlessness of the air. It is the constant moving to and fro of currents of air, either gentle or violent, which roughens the sea with waves. When the air for a time is calm above, the sea sleeps peacefully below; when the sky darkens, and a tempest bursts forth, the sea is lashed into waves, which roll in and break with enormous force upon the land.

You have heard, perhaps you have even seen, something of the destruction which is worked by the waves of the sea. Every year piers and sea walls are broken down, pieces of the coast are washed away, and the shores are strewn with the wreck of ships. So that, beside all the waste which the surface

of the land undergoes from rain, and frost, and streams, there is another form of destruction going on along the coast-line.

On some parts of the coast-line of the east of England, where the rock is easily worn away, the sea advances on the land at a rate of two or three feet every year. Towns and villages which existed a few centuries ago, have one by one disappeared, and their sites are now a long way out under the restless waters of the North Sea. On the west coast of Ireland and Scotland, however, where the rocks are usually hard and resisting, the rate of waste has been comparatively small.

It would be worth your while the first time you happen to be at the coast, to ascertain what means the sea takes to waste the land. This you can easily do by watching what happens on a rocky beach. Get to some sandy or gravelly part of the beach, over which the waves are breaking, and keep your eye on the water when it runs back after a wave has burst. You see all the grains of gravel and sand hurrying down the slope with the water; and if the gravel happens to be coarse, it makes a harsh grating noise as its stones rub against each other—a noise sometimes loud enough to be heard miles away. As the next wave comes curling along, you will mark that the sand and gravel, after slackening their downward pace, are caught up by the bottom of the advancing wave and dragged up the beach again, only to be hurried down once more as the water retires to allow another wave to do the same work.

By this continual up and down movement of the water, the sand and stones on the beach are kept grinding against each other, as in a mill. Consequently they are worn away. The stones become smaller, until they pass into mere sand, and the sand, growing finer, is swept away out to sea and laid down at the bottom.

But not only the loose materials on the shore suffer in this way an incessant wear and tear, the solid rocks underneath, wherever they come to the surface, are ground down in the same process. When the waves dash against a cliff they hurl the loose stones forward, and batter the rocks with them. Here and there in some softer part, as in some crevice of the cliff, these stones gather together, and when the sea runs high they are kept whirling and grinding at the base of the cliff till, in the end, a cave is actually bored by the sea in the solid rock, very much in the same way as holes are bored by a river in the bed of its channel. The stones of course are ground to sand in the process, but their place is supplied by others swept up by the waves. If you enter one of these sea-caves when the water is low, you will see how smoothed and polished its sides and roof are, and how well rounded and worn are the stones lying on its floor.

So far as we know, the bottom of the sea is very much like the surface of the land. It has heights and hollows, lines of valleys and ranges of hills. We can not see down to the bottom where the water is very deep, but we can let down a long line with a weight tied to the end of it, and find out both how deep the water is, and what is the nature of the bottom, whether rock or gravel, sand, mud, or shells. This measuring of the depths of the water is called sounding, and the weight at the end of the line goes by the name of the sounding-lead.

Soundings have been made over many parts of the sea, and something is now known about its bottom, though much still remains to be discovered. The Atlantic Ocean is the best known. In sounding it, before laying down the telegraphic cable which stretches across under the sea from this country to America, a depth of 14,500 feet, or two miles and three-quarters, was reached. But between the Azores and the Bermudas a sounding has been obtained of seven miles and a half. If you could lift up the Himalaya mountains, which are the highest on the globe, reaching a height of 29,000 feet above the sea, and set them down in the deepest part of the Atlantic, they would not only sink out of sight, but their tops would actually be about two miles below the surface.

A great part of the wide sea must be one or two miles deep.

But it is not all so deep as that, for even in mid-ocean some parts of its bottom rise up to the surface and form islands. As a rule it deepens in tracts furthest from land, and shallows toward the land. Hence those parts of the sea which run in among islands and promontories are, for the most part, comparatively shallow.

You may readily enough understand how it is that soundings are made, though you can see how difficult it must be to work a sounding line several miles long. Yet men are able not only to measure the depth of the water, but by means of the instrument called a dredge, to bring up bucketfuls of whatever may be lying on the sea floor, from even the deepest parts of the ocean. In this way during the last few years a great deal of additional knowledge has been gathered as to the nature of the sea floor, and the kind of plants and animals which live there. We now know that even in some of the deepest places which have yet been dredged there is plenty of animal life, such as shells, corals, star-fishes, and still more humble creatures.

We can not, indeed, examine the sea bottom with anything like the same minuteness as the surface of the land. Yet a great deal may be learnt regarding it.

If you put together some of the facts with which we have been dealing in the foregoing lessons, you may for yourselves make out some of the most important changes which are in progress on the floor of the sea. For example, try to think what must become of all the wasted rock which is every year removed from the surface of the land. It is carried into the sea by streams, as you have now learnt. But what happens to it when it gets there? From the time when it was loosened from the sides of the mountains, hills, or valleys, this decomposed material has been seeking, like water, to reach a lower level. On reaching the hollows of the sea bottom it can not descend any further, but must necessarily accumulate there.

It is evident, then, that between the floor of the sea and the surface of the land, there must be this great difference: that whereas the land is undergoing a continual destruction of its surface, from mountain crest to sea shore, the sea bottom, on the other hand, is constantly receiving fresh materials on its surface. The one is increased in proportion as the other is diminished. So that even without knowing anything regarding what men have found out by means of deep soundings, you could confidently assert that every year there must be vast quantities of gravel, sand and mud laid down upon the floor of the sea, because you know that these materials are worn away from the land.

Again, you have learnt that the restless agitation of the sea is due to movements of the air, and that the destruction which the sea can effect on the land is due chiefly to the action of the waves caused by wind. But this action must be merely a surface one. The influence of the waves can not reach to the bottom of the deep sea. Consequently that bottom lies beyond the reach of the various kinds of destruction which so alter the face of the land. The materials which are derived from the waste of the land can lie on the sea floor without further disturbance than they may suffer from the quiet flow of such ocean currents as touch the bottom.

In what way, then, are the gravel, sand and mud disposed of when they reach the sea?

As these materials are all brought from the land, they accumulate on those parts of the sea floor which border the land, rather than at a distance. We may expect to find banks of sand and gravel in shallow seas and near land, but not in the middle of the ocean.

You may form some notion, on a small scale, as to how the materials are arranged on the sea bottom by examining the channel of a river in a season of drought. At one place, where the current has been strong, there may be a bank of gravel; at another place, where the currents of the river have met, you will find, perhaps, a ridge of sand which they have heaped up; while in those places where the flow of the stream has been

more gentle, the channel may be covered with a layer of fine silt or mud. You remember that a muddy river may be made to deposit its mud if it overflows its banks so far as to spread over flat land which checks its flow.

The more powerful a current of water, the larger will be the stones it can move along. Hence coarse gravel is not likely to be found over the bottom of the sea, except near the land, where the waves can sweep it out into the path of strong sea currents. Sand will be carried further out, and laid down in great sheets, or in banks. The finer mud and silt may be borne by currents for hundreds of miles before at last settling down upon the sea bottom.

In this way, according to the nearness of the land, and the strength of the ocean currents, the sand, mud, and gravel worn from the land are spread out in vast sheets and banks over the bottom of the sea.

SUNDAY READINGS.

SELECTED BY THE REV. J. H. VINCENT, D.D.

[January 6.]

ON SPIRITUAL CHRISTIANITY.

By ISAAC TAYLOR.

Read the Gospels, simply as historical memoirs; and by such aids as they alone supply, make yourself acquainted with him who is the subject of these narrations. Bring the individual conception as distinctly as possible before the mind; allow the moral sense to confer, in its own manner, and at leisure, with this unusual form of humanity. "Behold the man"—even the Savior of the world, and say whether it be not historic truth that is before the eye. The more peculiar is this form, yet withal symmetrical, the more infallible is the impression of reality we thence receive. What we have to do with in this instance, is not an undefined ideal of wisdom and goodness, conveyed in round affirmations, or in eulogies; but with a self-developed individuality, in conveying which the writers of the narrative do not appear. In this instance, if in any, the medium is transparent: nothing intervenes between the reader and the personage of the history, in whose presence we stand, as if not separated by time and space.

It may be questioned whether the entire range of *ancient history* presents any one character in colors of reality so fresh as those which distinguish the personage of the evangelic memoirs. The sages and heroes of antiquity—less and less nearly related, as they must be, to any living interests, are fading amid the mists of an obsolete world; but he who "is the same yesterday, to-day, and forever," is offered to the view of mankind, in the eyes of immortality, fitting a history, which, instead of losing the intensity of its import, is gathering weight by the lapse of time.

The Evangelists, by the translucency of their style, have given a lesson in biographical composition, showing how perfectly individual character may be expressed in a method which disdains every rule but that of fidelity. It is personal humanity, in the presence of which we stand, while perusing the Gospels, and to each reader apart, if serious and ingenuous, and yet incredulous, the Savior of the world addresses a mild reproof—"It is I. Behold my hands and my feet; reach hither thy hand, and thrust it into my side, and be not faithless but believing." And can we do otherwise than grant all that is now demanded, namely, that the Evangelists record the actions and discourses of a real person?

It is well to consider the extraordinary contrasts that are yet perfectly harmonized in the personal character of Christ. At a first glance, he always appears in his own garb of humility—lowliness of demeanor is his very characteristic. But we must not forget that this lowliness was combined with nothing less than a solemnly proclaimed and peremptory challenge of rightful headship over the human race! Nevertheless, the oneness

of the character, the fair perfection of the surface, suffers no rent by this blending of elements so strangely diverse. Let us then bring before the mind, with all the distinctness we can, the conception of the Teacher, more meek than any who has ever assumed to rule the opinions of mankind, and who yet, in the tones proper to tranquil modesty, and as conscious at once of power and right, anticipates that day of wonder, when "the king shall sit on the throne of his glory," with his angels attendant; and when "all nations shall be gathered before him," from his lips to receive their doom! The more these elements of personal character are disproportionate, the more convincing is the proof of reality which arises from their harmony.

We may read the Evangelists listlessly, and not perceive this evidence; but we can never read them intelligently without yielding to it our convictions.

If the character of Christ be, as indeed it is, altogether unmatched in the circle of history, it is even less so by the singularity of the intellectual and moral elements which it combines, than by the sweetness and perfection which result from their union. This will appear the more, if we consider those instances in which the combination was altogether of an unprecedented kind.

Nothing has been more constant in the history of the human mind, whenever the religious emotions have gained a supremacy over the sensual and sordid passions, than the breaking out of the ascetic temper in some of its forms; and most often in that which disguises virtue, now as a specter, now as a maniac, now as a mendicant, now as a slave, but never as the bright daughter of heaven. Of the three Jewish sects extant in our Lord's time, two of them—that is to say, the two that made pretensions to any sort of piety, had assumed the ascetic garb, in its two customary species—the philosophic (the Essenes) and the fanatical (the Pharisees); and so strong and uniform is this crabbed inclination, that Christianity itself, in violent contrariety to its spirit and its precepts, went off into the ascetic temper, within a century after the close of the apostolic age, or even earlier.

Under this aspect, then, let us for a moment consider the absolutely novel phenomenon of the Teacher of a far purer morality than the world had heretofore ever listened to; yet himself affecting no singularities in his modes of living. The superiority of the soul to the body was the very purport of his doctrine; and yet he did not waste the body by any austerities! The duty of self-denial he perpetually enforced; and yet he practiced no factitious mortifications! This Teacher, not of abstinence, but of virtue; this Reprover, not of enjoyment, but of vice, himself went in and out among the social amenities of ordinary life with so unsolicitous a freedom as to give color to the malice of hypocrisy, in pointing the finger at him, saying, "Behold a gluttonous man, and a winebibber; a friend (companion) of publicans and sinners!" Should we not then note this singular apposition and harmony of qualities, that he who was familiar with the festivities of heaven did not any more disdain the poor solaces of mortality, than disregard its transient pains and woes? Follow this same Jesus from the banquets of the opulent, where he showed no scruples in diet, to the highways and wildernesses of Judea, where, never indifferent to human sufferings, he healed—"as many as came unto him."

These remarkable features in the personal character of Christ have often, and very properly, been adduced as instances of the unrivaled wisdom and elevation which mark him as pre-eminent among the wise and good.

It is not, however, for this purpose that we now refer to them, but rather as harmonies, altogether inimitable, and which put beyond doubt the historic reality of the person. Thus considered, they must be admitted by calm minds as carrying the truth of Christianity itself.

[January 13.]

There are, however, those who will readily grant us what, in-

deed, they can not with any appearance of candor deny—the historic reality of the person of Christ, and the more than human excellence which his behavior and discourses embody; but at this point they declare that they must stop. Let such persons see to it—they can not stop at this point; for just at this point there is no ground on which foot may stand.

What are the facts?

The inimitable characteristics of nature attach to what we may call the common incidents of the evangelic history, and in which Jesus of Nazareth is seen mingling himself with the ordinary course of social life.

But is it true that these characteristics suddenly, and in each instance, disappear when this same person is presented to us walking on another, and a high path, namely, that of supernatural power? *It is not so*, and, on the contrary, very many of the most peculiar and infallible of those touches of tenderness and pathos which so generally mark the evangelic narrative, belong precisely to the supernatural portions of it, and are inseparably connected with acts of miraculous beneficence. We ask that the Gospels be read with the utmost severity of criticism, and with this especial object in view, namely, to inquire whether those indications of reality which have already been yielded to as irresistible evidences of truth, do not belong as fully to the supernatural, as they do to the ordinary incidents of the Gospel? or in other words, whether, unless we resolve to overrule the question by a previous determination, any ground of simply historic distinction presents itself, marking off the supernatural from the ordinary events of the evangelic narratives?

If we feel ourselves to be conversing with historic truth, as well as with heavenly wisdom, when Jesus is before us, seated on the mountain-brow, and delivering the Beatitudes to his disciples; is it so that the colors become confused, and the contour of the figures unreal, when the same personage, in the midst of thousands, seated by fifties on the grassy slope, supplies the hunger of the multitude by the word of his power? Is it historic truth that is presented when the fearless Teacher of a just morality convicts the rabbis of folly and perversity; and less so when, turning from his envious opponents, he says to the paralytic, "Take up thy bed and walk?" Nature herself is before us when the repentant woman, after washing the Lord's feet with her tears, and wiping them with her hair, sits contrasted with the obdurate and uncourteous Pharisee; but the very same bright forms of reality mark the scene when Jesus, filled with compassion at the sight of a mother's woe, stays the bier and renders her son alive to her bosom.

Or, if we turn to those portions of the Gospels in which the incidents are narrated more in detail, and where a greater variety of persons is introduced, and where, therefore, the supposition of fabrication is the more peremptorily excluded, it is found that the supernatural and the ordinary elements are in no way to be distinguished in respect of the simple vivacity with which both present themselves to the eye. The evangelic narrative offers the same bright translucency, the same serenity, and the same precision, in reporting the most astounding as the most familiar occurrences. It is like a smooth-surfaced river, which, in holding its course through a varied country reflects from its bosom at one moment the amenities of a homely border, and at the next the summits of the Alps, and both with the same unruffled fidelity.

As the subject of a rigorous historic criticism, and all hypothetical opinions being excluded, no pretext whatever presents itself for drawing a line around the supernatural portions of the Gospels, as if they were of suspicious aspect, and differed from the context in historic verisimilitude. Without violence done to the rules of criticism, we can not detach the miraculous portions of the history, and then put together the mutilated portions, so as to consist with the undoubted reality or the part which is retained.

Or take the narrative of the raising of Lazarus of Bethany.

A brilliant vividness, as when a sunbeam breaks from between clouds, illumines this unmatched history; and it rests with equal intensity upon the stupendous miracle, and upon the beauty and grace of the scene of domestic sorrow. If we follow Martha and Mary from the house to the spot where they meet their friend, and give a half-utterance to their confidence in his power, at what step—let us distinctly determine—at what step, as the group proceeds toward the sepulchre, shall we halt and refuse to accompany it? Where is the break in the story, or the point of transition, and where does history finish, and the spurious portion commence? Is it when we approach the cave's mouth that the gestures of the persons become unreal, and the language untrue to nature? Where is it that the indications of tenderness and majesty disappear—at the moment when Jesus weeps, or when he invokes his Father, or when, with a voice which echoes in hades, he challenges the dead to come forth; or is it when "he who was dead" obeys this bidding?

We affirm that, on no principles which a sound mind can approve, is it *possible* either to deny the reality of the natural portions of this narrative, or to sever these from the supernatural. But this is not enough; for it might be in fact more easy to offer some intelligible solution of the difficulty attaching to the supposition that the gospels are not true, in respect of the ordinary, than of the extraordinary portion of their materials. If we were to allow it to be possible (which it is not) that writers showing so little inventive or plastic powers as do Matthew the Publican, and John of Galilee, should, with the harmony of truth, have carried their imaginary Master through the *common* acts and incidents of his course; never could they, no, nor writers the most accomplished, have brought him, in modest simplicity, through the *miraculous* acts of that course. Desperate must be the endeavor to show that, while the ordinary events of the gospel must be admitted as true, the extraordinary are incredible. On the contrary, it would be to the former, if to any, that a suspicion might attach; for, as to the latter, they can not but be true: if not true, whence are they?

The skepticism, equally condemned as it is by historical logic and by the moral sense, which allows the natural and disallows the supernatural portion of the history of Christ, is absolutely excluded when we compare, in the four Gospels separately, the narrative of what precedes the resurrection, with the closing portions, which bring the crucified Jesus again among his disciples.

[January 20.]

If those portions of the evangelic history which reach to the moment of the death of Christ are, in a critical sense, of the same historic quality as those which run on to the moment of his ascension, and if the former absolutely command our assent—if they carry it as by force, then, by a most direct inference, "is Christ risen indeed," and become the first fruits of immortality to the human race. Then it is true that, "as in Adam all die, so in Christ shall all be made alive." No narrative is anywhere extant comparable to that of the days and hours immediately preceding the crucifixion; and the several accounts of the hurried events of those days present the minute discrepancies which are always found to belong to genuine memoirs, compiled by eye-witnesses.

The last supper and its sublime discourses; the agony in the garden, the behavior of the traitor, the scenes in the hall of the chief priest, and before the judgment-seat of the Roman procurator, and in the palace of Herod, and in the place called the Pavement, and on the way from the city, and in the scene on Calvary, are true—if anything in the compass of history be true.

But now, if our moral perceptions are in this way to be listened to, not less incontestably real are the closing chapters of the four Gospels, in which we find the same sobriety and the same vivacity; the same distinctness and the same freshness; the same pathos and the same wisdom, and the same majesty; and yet all

chastened by the recollected sorrows of a terrible conflict just passed, and mellowed with the glow of a triumph at hand.

Let it be imagined that writers such as the Evangelists might have led their Master as far as to Calvary; but could they, unless truth had been before them, have reproduced him from the sepulchre? What abruptness, harshness, extravagance, what want of harmony, would have been presented in the closing chapters of the Gospels, if the same Jesus had not supplied the writers with their materials by going in and out among them after his resurrection.

On the supposition that Christ did not rise from the dead, let any one whose moral tastes are not entirely blunted, read the narrative of his encounter with Mary in the garden, and with his disciples in the inner chamber, and again on the shore of the lake; let him study the perfect simplicity and yet the warmth of the interview with the two disciples on their way to Emmaus. The better taste of modern times, and the just sense of what is true in sentiment and pure in composition, give us an advantage in an analysis of this sort. Guided, then, by the instincts of the most severe taste, let us spread before us the final portion of the Gospel of Luke, namely, the twenty-fourth chapter, which reports a selection of the events occurring between the early morning of the first day of the week, and that moment of wonder when, starting from the world he had ransomed, the Savior returned whence he had come. Will any one acquainted with antiquity affirm that any writer, Greek, Roman, or barbarian, has come down to us, whom we can believe capable of conceiving at all of such a style of incident or discourse; or who, had he conceived it, could have conveyed his conception in a style so chaste, natural, calm, lucid, pure? Nothing like this narrative is contained in all the circle of fiction, and nothing equal to it in all the circle of history; and yet nothing is more perfectly consonant with the harmonies of nature. We may listlessly peruse this page, each line of which wakens a sympathy in every bosom which itself responds to truth. But if we ponder it, if we allow the mind to grasp the several objects, we are vanquished by the conviction that all is real. But if real, and if Christ be risen indeed, then is Christianity indeed a *religion of facts*; and then we are fully entitled to a bold affirmation and urgent use of whatever inferences may thence be fairly deduced.

Acute minds will not be slow to discern, as in perspective before them, the train of those inferences which we shall feel ourselves at liberty to deduce from the admission that Christianity is *historically true*. This admission can not, we are sure, be withheld; and yet let it not be made with a reserved intention to evade the consequences. What are they? They are such as embrace the personal well-being of every one; for, if Christianity be a history, it is a history still in full progress; it is a history running on, far beyond the dim horizon of human hopes and fears.

[January 27.]

But it is said, all this, at the best, is *moral evidence only*; and those who are conversant with mathematical demonstrations, and with the rigorous methods of physical science, must not be required to yield their convictions easily to *mere moral evidence*.

We ask, have those who are accustomed thus to speak, actually considered the import of their objection; or inquired what are the consequences it involves, if valid? We believe not; and we think so, because the very terms are destitute of logical meaning; or imply, if a meaning be assigned to them, a palpable absurdity.

If, for a moment, we grant an intelligible meaning to the objection as stated, and consent to understand the terms in which it is conveyed, as they are often used, then we affirm that some portion of even the abstract sciences is less certain than are very many things established by what is called moral evidence—that a large amount of what is accredited as probably true within the circle of the physical and mixed sciences is *im-*

measurably inferior in certainty to much which rests upon moral evidence; and further, that so far from its being reasonable to reject this species of evidence, the mere circumstance of a man's being known to distrust it in the conduct of his daily affairs, would be held to justify, in his case, a commission of lunacy.

No supposition can be more inaccurate than that which assumes the three kinds of proof, *mathematical*, *physical*, and *moral*, to range, one beneath the other, in a regular gradation of certainty; as if the mathematical were in all cases absolute; the physical a degree lower, or, as to its results, in some degree, and always, less certain than those of the first; and, by consequence, the third being inferior to the second, necessarily far inferior to the first; and therefore, always much less certain than that which alone deserves to be spoken of as *certain*, and in fact barely trustworthy in any case.

Any such distribution of the kinds of proof is mere confusion, illogical abstractedly, and involving consequences, which, if acted upon, would appear ridiculously absurd.

It is indeed true that the three great classes of facts—the *universal*, or absolute (mathematical and metaphysical)—the *general*, or physical, and the *individual* (forensic and historical) are pursued and ascertained by three corresponding methods, or, as they might be called, three logics. But it is far from being true that the three species of reasoning hold an *exclusive* authority or sole jurisdiction over the three classes of facts above mentioned. Throughout the physical sciences the mathematical logic is perpetually resorted to, while even within the range of the mathematical the physical is, once and again, brought in as an aid. But if we turn to the *historical* and *forensic* department of facts, the three methods are so blended in the establishment of them, that to separate them altogether is impracticable; and as to *moral* evidence, if we use the phrase in any intelligible sense, it does but give its aid, at times, on this ground; and even then the conclusions to which it leads rest upon inductions which are physical, rather than moral.

The conduct of a complicated historical or forensic argument concerning individual facts, resembles the manipulations of an adroit workman, who, having some nice operation in progress, lays down one tool and snatches up another, and then another, according to the momentary exigencies of his task.

That sort of evidence may properly be called *moral*, which appeals to the moral sense, and in assenting to which, as we often do with an irresistible conviction, we are unable, with any precision, to convey to another mind the grounds of our firm belief. It is thus often that we estimate the veracity of a witness or judge of the reality or spuriousness of a written narrative. But then even this sort of evidence, when nicely analyzed, resolves itself into physical principles.

What are these convictions which we find it impossible to clothe in words, but the results in our minds, of slow, involuntary inductions concerning moral qualities, and which, inasmuch as they are peculiarly exact, are not to be transfused into a medium so vague and faulty as is language, at the best?

As to the mass of history, by far the larger portion of it rests, in no proper sense, upon *moral* evidence. To a portion the mathematical doctrine of probabilities applies—for it may be as a million to one—that an alleged fact, under all the circumstances, is true. But the proof of the larger portion resolves itself into our knowledge of the laws of the material world, and of those of the world of mind. A portion also is conclusively established by a minute scrutiny of its agreement with that intricate combination of small events which makes up the course of human affairs.

Every *real* transaction, especially those which flow on through a course of time, touches this web-work of small events at many points, and is woven into its very substance. Fiction may indeed paint its personages so as for a moment to deceive the eye, but it has never succeeded in the attempt to foist its factitious embroideries upon the tapestry of truth.

We might take as an instance that irresistible book in which Paley has established the truth of the personal history of St. Paul ("The *Horæ Paulinæ*"). It is throughout a tracing of the thousand fibres by which a long series of events connects itself with the warp and woof of human affairs. To apply to evidence of this sort, the besom of skepticism, and sweepingly to remove it as consisting only in *moral evidence*, is an amazing instance of confusion of mind.

It is often loosely affirmed that history rests mainly upon moral evidence. Is then a Roman camp moral evidence? Or is a Roman road moral evidence? Or are these and many other facts, when appealed to as proof of the assertion that, in a remote age, the Romans held military occupation of Britain, moral evidence? If they be, then we affirm that, when complete in its kind, it falls not a whit behind mathematical demonstration, as to its certainty.

Although it is not true that Christianity rests mainly upon moral evidence, yet it is true that it might rest on that ground with perfect security.

It is to this species of evidence that we have now appealed; not as establishing the heavenly origin of Christianity, which it *does* establish, but simply as it attests the historic reality of the person of Christ, and here we must ask an ingenuous confession from whoever may be bound in *foro conscientiæ* to give it, that the notion of Christianity, and the habitual feelings toward it of many in this Christian country, are such as if brought to the test of severe reasoning could by no ingenuity be made to consist either with the supposition that Christianity is historically false, or that it is historically true! This ambiguous faith of the cultured, less reasonable than the superstitions of the vulgar (for they are consistent, which this is not,) could never hold a place in a disciplined mind but by an act, repeated from day to day, and similar to that of a man who should refuse to have the shutters removed from the windows on that side of his house whence he might descry the residence of his enemy.

If Christianity be historically true it must be granted to demand more than a respectful acknowledgment that its system of ethics is pure; or were it historically false, we ought to think ourselves to be outraging at once virtue and reason in allowing its name to pass our lips. *While bowing to Christianity as good and useful, and yet not invested with authority toward ourselves, we are entangled in a web of inconsistencies, of which we are not conscious, only because we choose to make no effort to break through it. If Christianity be true, then it is true that "we must all appear before the judgment seat of Christ," and must, "every one of us, give an account of himself to God." What meaning do such words convey to the minds of those who, with an equal alarm, would see Christianity overthrown as a controlling power in the social system; or find it brought home to themselves, as an authority, they must personally bow to? Christians! How many amongst us are *Christians*, as men might be called philosophers, who, while naming Newton always with admiration, should yet reserve their interior assent for the very paganism of astronomy.

A religion of facts, we need hardly observe, is the only sort of religion adapted powerfully to affect the hearts of the mass of mankind; for ordinary or uncultured minds can neither grasp, nor will care for, abstractions of any kind. But then that which makes Christianity proper for the many, and indeed proper for all, if motives are to be effectively swayed, renders it a rock of offense to the few who will admit nothing that may not be reduced within the circle of their favored generalizations. Such minds, therefore, reject Christianity, or hold it in abeyance, not because they can disprove it, but because it will not be generalized, because it will not be sublimated, because it will not be touched by the tool of reason; because it must remain what it is—an insoluble mass of facts. In attempting to urge consistency upon such persons, the advocate of Christianity makes no progress, and has to return, ever and again, to

his document, and to ask: Is this true, or false? If true, your metaphysics *may* be true also; but yet must not give law to your opinions; much less, govern your conduct.

Resolute as may be the determination of some to yield to no such control, nevertheless if the evangelic history be true, "one is our Master, even Christ." He is our Master in abstract speculation—our Master in religious belief, our Master in morals, and in the ordering of every day's affairs.

It will be readily admitted that this our first position, if it be firm, sweeps away, at a stroke, a hundred systems of religion, ancient and modern, which either have not professed to rest upon historic truth, or which have notoriously failed in making good any such pretension. These various schemes need not be named; they barely merit an enumeration; they are susceptible of no distinct refutation, for they are baseless, powerless, obsolete.

Say you that Christianity is intolerant in thus excluding all other systems? A religion which excludes that which is false is not therefore intolerant. If it be true, it must exclude all that is untrue. Let us have a religion willing to walk abreast with other religions—religions affirming what it denies, and denying what it affirms—but indulgent toward all. An intolerant religion is the religion of a sect, and of a sect in fear.

POLITICAL ECONOMY.

IV.

DISTRIBUTION.

I. Distribution in economics embraces those principles on which the proceeds of industry are divided among the parties employed in their production.

If each man owned all the capital concerned in his business, and performed all the labor involved in each product, this question would be a very simple one. But when, as in the manufacture of chairs, of hardware and watches, and in the building of houses, there are many laborers of widely diverse capabilities, and especially when we remember that there are innumerable subsidiary occupations, as in the preparing of materials, the making of tools and machines, the protection of the workmen, the superintendence of the business, and in many other ways, the problem becomes a most complicated one.

The subject may be divided as follows:

1. *Wages*, or the compensation of labor.
2. *Profits*, or the compensation of the proprietor or employer.
3. *Interest*, or compensation for capital reckoned as money.
4. *Rent*, or compensation for the use of land.
5. *Taxes*, or compensation for protection by the government.

II. On the subject of *wages* diverse and contradictory opinions prevail. A large proportion of the British economists hold the theory that a low rate of wages is all that can be maintained, or is, on the whole, desirable among ordinary unskilled laborers. That a man should have compensation sufficient to furnish him with such food, raiment and shelter as are essential to keep him in good working condition; also, in addition, enough to enable him to support a wife (with what she can herself earn), and to rear at least two children, themselves prepared to become laborers; and to make some additional allowances for probable periods of sickness and inability to labor. So much is deemed absolutely essential even to the capitalist and employer, in order that their interests may not suffer. The school of writers referred to profess to find in the human constitution a law which prevents wages from going much beyond this limit. It is said that if they do go much beyond this, the population will multiply so rapidly, and the num-

ber of laborers will so greatly increase, that wages will not only fall back to their limit, but that great suffering will ensue.

Most American writers reject this view, though some of them appear to hold opinions logically implying it. Henry C. Carey takes the ground that there is not only no such law; but that there is one of a diametrically opposite character, which as thoroughly coincides with, as this antagonizes, the general provisions of an all-wise and beneficent creator. This law, as developed by Mr. Carey, is substantially that in any community where violence is not done to natural principles in the relations between capitalists and laborers, the share of the latter in the joint product to which both are contributors, is constantly increasing. While at first the capitalist receives much more than half, as time and the development of society go on his proportion is steadily diminishing till it becomes a small fraction of the whole, while that of the laborer is steadily increasing. At the same time, though the *proportion* of the capitalist is always smaller, the *amount* is always larger, owing to the always increasing productiveness; and for the same reason both the *proportion* and the *amount* received by the laborer is enhanced. Evidence of this might be made obvious by comparing the compensation received by laborers in the earlier ages of almost any civilized race as compared with that received in its most advanced stage; and this, too, notwithstanding the vast imperfections under which society has labored and the unnatural conditions to which the laboring classes in all the earlier periods of history have been subjected. In the opinion of some writers this law is one of the grandest and most important of the recent discoveries in political economy.

III. Wages depend upon various considerations. Some of the chief of these are physical ability, greater or less degree of skill, agreeableness or disagreeableness of the work, greater or less difficulty and cost of preparation, constancy or inconstancy of employment, amount of trust involved, intellectual and moral qualities required, social conditions, the character of the government, etc.

There is a distinction to be made between *nominal* and *real* wages. The former is the amount of money received for a certain amount of labor. The latter is the amount of useful commodities which that money will purchase. Sometimes a dollar a day is better compensation than a dollar and a half at other times, since in the latter case the dollar and a half may purchase fewer of the necessities of life than the dollar in the former case.

Men fail sometimes to get a clear understanding of the terms *dear* labor and *cheap* labor. A Russian serf at fifty cents a day is dearer than an ordinary American laborer at a dollar and a half, simply because the labor of the latter would be about four or five times as efficient as that of the former. In other words, that labor is the cheapest which will produce the most at the least expense.

The interested and wise laborer will seek information wherever he can find it on the effect of even moderate education on individual wages, (and this he will find to be very considerable; on the sanitary conditions which are best for laborers, the real and ultimate effects of strikes and trades unions, and the advantages and disadvantages of coöperative industry and trade, and the great benefit to be derived from making the laborer a sharer in the profits of any business in which he may be engaged. The employer also would receive great benefit from a careful study of these same questions, as well as from a consideration of the results of paying in all cases not the lowest wages for which labor can be procured, but the highest which he can really afford, since in many cases the quality and quantity of work secured from this cause, more than compensates the extra outlay.

IV. *Profits* are the share of the product which go to the proprietor or employer. Very often the latter are confounded with the capitalist, and hence arises a like confusion concerning the nature of profits. Among more recent writers a distinct place

is assigned to the *employer*, whereas formerly he was practically lost sight of. But in our modern system of industry he is one of the most important, if not actually the most important factor in the system. The capitalist is not necessarily an employer—more frequently than otherwise he is incompetent for this office. Nor is the employer always a capitalist. He is a man who must have the somewhat rare ability to organize and superintend labor so as to get the most possible out of it, and at the same time have such financial talent as will enable him to make the best possible disposition of his means in buying material, etc., and the best possible disposition of his goods in selling. Frequently the capital which he uses is borrowed. Profits, then, are what remains after paying all stipulated wages and salaries, including a fair compensation to the employer himself, together with the material, rent, interest on capital owned or borrowed, taxes, insurance, etc. Obviously no one would assume all the care and responsibility, and incur the risk implied in any considerable business unless something more was likely to come from it to him than what his talent and ability would bring in the way of salary. Sometimes the profit is very small; sometimes, also, it is very great. Free competition will furnish the requisite conditions usually, so that the profits will not be so large as to be disadvantageous to the community generally.

V. *Interest* depends upon various considerations. That the compensation implied is proper is obvious from the fact that though ostensibly money is that which is loaned, in most cases it is really capital in some other form; and no one denies that when a man lends his horse, or his mill, or his farm, he should receive something for the use of it.

The rate of interest depends upon several conditions: 1. The amount of money in circulation. 2. The amount of other capital. 3. The rate of profit, which again depends upon the industrial system and the state of society; as society develops the rate diminishes. 4. The security or insecurity of property. 5. The facilities with which the securities can be reconverted into money. 6. The promptness and regularity of the payment of the interest. On these last two conditions rests in part the low rate of interest on government bonds.

VI. *Rent* is intimately connected with the value of land, and land is the most important instrument and condition of wealth. In most countries, other than ours, the land is principally in the possession of a few owners who let it to other parties for agricultural and other purposes, and receive compensation therefor. The amount of compensation depends upon the value of the land. For this latter reason we may treat the whole question of the value of land under the head of rent, though on some accounts it should be considered in another place.

The theory respecting rent which has prevailed in England, and largely in this country for the most of the present century, is that of Ricardo; and closely connected with it is his theory of value. He held that rent arises in this way: On the first settling of a new country, where there is an abundance of more or less fertile land, none of the land has any value. Every man takes as much as he wants, selecting, of course, the most productive. As population increases the best land will be all taken up. Then those who want land must have a poorer quality, or a second grade. Now, one who gets this second quality would rather pay something for the first quality than to have the former for nothing. So when all the land of the second grade is all taken up, and the third quality begins to be occupied, it is deemed more profitable to pay something for the second quality, and still more for the first quality than to have the third for nothing. Closely connected with this theory of rent is that of Malthus concerning population, which is, that there is a law of the uniform increase of population, so that unless artificial checks are applied over-population must, at no distant day, become the condition and bane of humanity. Another theory closely related to both these is that of "dimin-

ishing returns," as stated by J. S. Mill. Substantially this is, that after a certain, not very advanced period in the development of agriculture, a given amount of land will produce less and less in proportion to the labor expended upon it. That is, after a certain degree of culture, a given quantity of land which yields a given quantity of product, while it will produce more if the labor upon it is doubled, will not produce double the former quantity. It follows from these theories, taken in combination, that as men multiply and their wants increase, the provision for those wants proportionately diminishes—a most unnatural and dismal theory, and up to the present time quite contrary to human experience.

A more reasonable, more natural, and far more hopeful doctrine is that developed by Mr. Carey. He declares it altogether untrue that the most productive lands are those first occupied. On the contrary, in the infancy of society men are wholly unable to subdue the richer soils. These must wait till society becomes more numerous and capable of combination. At first only the thinner soils can be cultivated, on account of the feebleness of the inhabitants. Then, as the latter increase in numbers and in the power and art of combination, the deeper and heavier soils can be subdued, and finally, those which are covered with gigantic forests or rich swamps and vast deposits of vegetable mold. These are many times more productive than the soils first cultivated, and thus for a long period proportionately *increasing* instead of *diminishing* returns are found to go with the increase of population. There is scarcely any nation, the inhabitants of which have even now cultivated its most productive soil, and it is likely to be some time yet before the theoretical limit of diminishing returns is reached.

The Malthusian doctrine of population is also widely, though not universally rejected, and it is evident that various counter-acting principles prevail to affect the law of the uniform increase of population, even if that were demonstrably or approximately true. It is tolerably obvious that the fecundity of the human race diminishes as its development and civilization increase. This, taken in connection with the preceding statements, gives us great grounds, at least, for dispensing with the more forbidding features of what has been called "the dismal science."

Mr. Carey's theory of the occupancy of land, as he abundantly shows, is consistent, and the only one consistent, not only with the great fundamental principles of association, but with the facts reached in the history of every civilized nation. He also holds that the value of land depends upon the same principle as that of any other value, namely, the labor that has been expended upon it. For, as he shows, there is in general no land that has a value which exceeds that of the labor which has been requisite to bring it and the property related to it into its present condition.

VII. *Taxation* furnishes the compensation paid to the government for its protection. Government is simply the agent of society, and those who are the individual constituents of this agency are entitled to a share of the aggregate product proportionate to the amount and quality of the labor bestowed.

The great economical question concerning taxation is how to secure the greatest degree of protection to persons and property at the least possible expense to the persons protected. Its decision depends partly upon the expensiveness of the government agencies, and partly upon the methods of levying and collecting the taxes. As to the former, there is a great variety of usage in different nations, or in the same nation at different periods. Not only is this difference seen in the amount of compensation paid to personal agents directly concerned in the administration of public affairs, but in the costliness of the public buildings and other means for carrying out the purposes of the government. It is evident a true economy does not demand either parsimony or niggardliness in these respects. The *best* agents can only be secured by making the compensation

to correspond to that paid for the same grade of services in other employments. The edifices and other structures and furniture should both correspond with the purposes for which they are to be used, and with the general style of expenditure prevailing in the community. But all expense for the mere sake of show, all extravagance and prodigality, and all compensation bestowed as a reason for partisan service or out of personal favoritism, is not only uneconomical, but for the most part fraudulent.

In the levying and collecting of taxes for revenue two general methods are pursued, namely, *direct* and *indirect*. In the former the tax is paid by the party upon whom it is levied. Such are taxes upon real estate, tools, machinery, domestic animals, etc. In indirect taxation the tax, though levied upon one person, is usually paid by another. Thus, during our civil war, there was a stamp-tax of one cent on each bunch of matches. The manufacturer paid the tax to the government, but the consumer of matches paid a cent more for each bunch of matches than it would have otherwise cost him. Duties on foreign imports are of this character.

Direct taxes, though by far more just and equitable than indirect, are far less popular. The reason of this is doubtless to be found in the fact that when the tax-payer meets his obligation in the former case he does it consciously and with a clear sense that he is parting with so much actual wealth. In the latter case it is often done unconsciously, and almost always without realization of the fact. Yet, for this very reason, it is better that the tax be direct than indirect.

READINGS IN ART.

I. ARCHITECTURE.* INTRODUCTION.

Architecture may be described as building at its best, and when we talk of the architecture of any city or country we mean its best, noblest, or most beautiful buildings; and we imply by the use of the word that these buildings possess merits which entitle them to rank as works of art.

The architecture of the civilized world can be best understood by considering the great buildings of each important nation separately. The features, ornaments, and even forms of ancient buildings differed just as the speech, or at any rate the literature, differed. Each nation wrote in a different language, though the books may have been devoted to the same aims; and precisely in the same way each nation built in a style of its own, even if the buildings may have been similar in the purposes they had to serve. The division of the subject into the architecture of Egypt, Greece, Rome, etc., is therefore the most natural one to follow.

But certain broad groups, rising out of peculiarities of a physical nature, either in the buildings themselves or in the conditions under which they were erected, can hardly fail to be suggested by a general view of the subject. Such, for example, is the fourfold division to which the reader's attention will now be directed.

All buildings, it will be found, can be classed under one or other of four great divisions, each distinguished by a distinct mode of building, and each also occupying a distinct place in history. The first series embraces the buildings of the Egyptians, the Persians, and the Greeks, and was brought to a pitch of the highest perfection in Greece during the age of Pericles. All the buildings erected in these countries during the many centuries which elapsed from the earliest Egyptian to the latest Greek works, however they may have differed in other respects, agree in this—that the openings, be they doors, or be they spaces between columns, were spanned by beams of wood or lintels of stone. Hence this architecture is called architecture of the beam, or, in more formal language, trabeated architec-

ture. This mode of covering spaces required that in buildings of solid masonry, where stone or marble lintels were employed, the supports should not be very far apart, and this circumstance led to the frequent use of rows of columns. The architecture of this period is accordingly sometimes called columnar, but it has no exclusive claim to the epithet; the column survived long after the exclusive use of the beam had been superseded, and the term columnar must accordingly be shared with buildings forming part of the succeeding series.

The second great group of buildings is that in which the semicircular arch is introduced into construction, and used either together with the beam, or, as mostly happened, instead of the beam, to span the openings. This use of the arch began with the Assyrians, and it reappeared in the works of the early Etruscans. The round-arched series of styles embraces the buildings of the Romans from their earliest beginnings to their decay; it also includes the two great schools of Christian architecture which were founded by the Western and the Eastern Church respectively—namely, the Romanesque, which, originating in Rome, extended itself through Western Europe, and lasted till the time of the Crusades, and the Byzantine, which spread from Constantinople over all the countries in which the Eastern (or Greek) Church flourished, and which continues to our own day.

The third group of buildings is that in which the pointed arch is employed instead of the semicircular arch to span the openings. It began with the rise of Mohammedan architecture in the East, and embraces all the buildings of Western Europe from the time of the First Crusade to the revival of art in the fifteenth century. This great series of buildings constitutes what is known as pointed, or, more commonly, as gothic architecture.

The fourth group consists of the buildings erected during or since the Renaissance (*i. e.*, revival) period, and is marked by a return to the styles of past ages or distant countries for the architectural features and ornaments of buildings; and by that luxury, complexity, and ostentation which, with other qualities, are well comprehended under the epithet modern. This group of buildings forms what is known as Renaissance architecture, and extends from the epoch of the revival of letters in the fifteenth century to the present day.

The first two of these styles occupy those remote times of pagan civilization which may be conveniently included under the broad term ancient; and the better known work of the Greeks and Romans—the classic nations—and they extend over the time of the establishment of Christianity down to the close of that dreary period not incorrectly termed the dark ages.

It may excite surprise that what appears to be so small a difference as that which exists between a beam, a round arch, or a pointed arch, should be employed in order to distinguish three of the four great divisions. But in reality this is no pedantic or arbitrary grouping. The mode in which spaces or openings are covered lies at the root of most of the essential differences between styles of architecture, and the distinction thus drawn is one of a real, not of a fanciful nature.

Every building when reduced to its elements, as will be done in these papers, may be considered as made up of its (1) floor or plan, (2) walls, (3) roof, (4) openings, (5) columns, and (6) ornaments, and as marked by its distinctive (7) character, and the student must be prepared to find that the openings are by no means the least important of these elements. In fact, the moment the method of covering openings was changed, it would be easy to show, did space permit, that all the other elements, except the ornaments, were directly affected by the change, and the ornaments indirectly; and we thus find such a correspondence between this index feature and the entire structure as renders this primary division a scientific though a very broad one.

A division of buildings into such great series as these can not, however, supersede the more obvious historical and geograph-

* Abridged from "Architecture, Classic and Early Christian," by T. Roger Smith and John Slater.

cal divisions. The architecture of every ancient country was partly the growth of the soil, *i. e.*, adapted to the climate of the country, and the materials found there, and partly the outcome of the national character of its inhabitants, and of such influences as race, colonization, commerce, or conquest brought to bear upon them. These influences produced strong distinctions between the work of different peoples, especially before the era of the Roman Empire. Since that period of universal dominion all buildings and styles have been influenced more or less by Roman art. We accordingly find the buildings of the most ancient nations separated from each other by strongly marked lines of demarcation, but those since the era of the empire showing a considerable resemblance to one another. The circumstance that the remains of those buildings only which received the greatest possible attention from their builders have come down to us from any remote antiquity, has perhaps served to accentuate the differences between different styles, for these foremost buildings were not intended to serve the same purpose in all countries. Nothing but tombs and temples have survived in Egypt. Palaces only have been rescued from the decay of Assyrian and Persian cities; and temples, theaters, and places of public assembly are the chief, almost the only remains of architecture in Greece.

A strong contrast between the buildings of different ancient nations rises also from the differing point of view for which they were designed. Thus, in the tombs, and, to a large extent, the temples of the Egyptians, we find structures chiefly planned for internal effect, that is to say, intended to be seen by those admitted to the sacred precincts, but only to a limited extent appealing to the admiration of those outside. The buildings of the Greeks, on the other hand, were chiefly designed to please those who examined them from without; and though no doubt some of them, the theaters especially, were from their very nature planned for interior effect, by far the greatest works which Greek art produced were the exteriors of the temples.

The works of the Romans, and, following them, those of almost all western Christian nations, were designed to unite external and internal effect; but in many cases external was evidently most sought after, and, in the north of Europe, many expedients—such, for example, as towers, high-pitched roofs, and steeples—were introduced into architecture with the express intention of increasing external effect. On the other hand, the eastern styles, both Mohammedan and Christian, especially when practiced in sunny climates, show in many cases a comparative disregard of external effect, and that their architects lavished most of their resources on the interiors of their buildings.

Passing allusions have been made to the influence of climate on architecture; and the student whose attention has been once called to this subject will find many interesting traces of this influence in the designs of buildings erected in various countries. Where the power of the sun is great, flat terraced roofs, which help to keep buildings cool, and thick walls are desirable. Sufficient light is admitted by small windows far apart. Overhanging eaves, or horizontal cornices, are in such a climate the most effective mode of obtaining architectural effect, and accordingly in the styles of all southern peoples these peculiarities appear. The architecture of Egypt, for example, exhibited them markedly. Where the sun is still powerful, but not so extreme, the terraced roof is generally replaced by a sloping roof, steep enough to throw off water, and larger openings are made for light and air; but the horizontal cornice still remains the most appropriate means of gaining effects of light and shade. This description will apply to the architecture of Italy and Greece. When, however, we pass to northern countries, where snow has to be encountered, where light is precious, and where the sun is low in the heavens for the greater part of the day, a complete change takes place. Roofs become much steeper, so as to throw off snow. The horizontal cornice is to a large extent disused, but the buttress the turret, and other vertical features,

from which a level sun will cast shadows, begin to appear; and windows are made numerous and spacious. This description applies to gothic architecture generally—in other words, to the styles which rose in northern Europe.

The influence of materials on architecture is also worth notice. Where granite, which is worked with difficulty, is the material obtainable, architecture has invariably been severe and simple; where soft stone is obtainable, exuberance of ornament makes its appearance, in consequence of the material lending itself readily to the carver's chisel. Where, on the other hand, marble is abundant and good, refinement is to be met with, for no other building material exists in which very delicate mouldings or very slight or slender projections may be employed with the certainty that they will be effective. Where stone is scarce, brick buildings, with many arches, roughly constructed cornices and pilasters, and other peculiarities both of structure and ornamentation, make their appearance, as, for example, in Lombardy and North Germany. Where materials of many colors abound, as is the case, for example, in the volcanic districts of France, polychromy is sought as a means of ornamentation. Lastly, where timber is available, and stone and brick are both scarce, the result is an architecture of which both the forms and the ornamentation are entirely dissimilar to those proper to buildings of stone, marble, or brick.

EGYPTIAN ARCHITECTURE.

The remains of Egyptian architecture with which we are acquainted indicate four distinct periods of great architectural activity: (1) the period of the fourth dynasty, when the great pyramids were erected (probably 3500 to 3000 B. C.); (2) the period of the twelfth dynasty, to which belong the remains at Beni-Hassan; (3) the period of the eighteenth and nineteenth dynasties, when Thebes was in its glory, which is attested by the ruins of Luxor and Karnak; and (4) the Ptolemaic period, of which there are the remains at Denderah, Edfou, and Philæ. The monuments that remain are almost exclusively tombs and temples. The tombs are, generally speaking, all met with on the east or right bank of the Nile: among them must be classed those grandest and oldest monuments of Egyptian skill, the pyramids, which appear to have been all designed as royal burying-places. A large number of pyramids have been discovered, but those of Gizeh, near Cairo, are the largest and the best known, and also probably the oldest which can be authenticated. The three largest pyramids are those of Cheops, Cephren, and Mycerinus at Gizeh. These monarchs all belonged to the fourth dynasty, and the most probable date to be assigned to them is about 3000 B. C. The pyramid of Cheops is the largest, and is the one familiarly known as the Great Pyramid; it has a square base, the side of which is 760 feet long,* a height of 484 feet, and an area of 577,600 square feet. In this pyramid the angle of inclination of the sloping sides to the base is $51^{\circ} 51'$, but in no two pyramids is this angle the same. There can be no doubt that these huge monuments were erected each as the tomb of an individual king, whose efforts were directed toward making it everlasting, and the greatest pains were taken to render the access to the burial chamber extremely hard to discover. This accounts for the vast disproportion between the lavish amount of material used for the pyramid and the smallness of the cavity enclosed in it.

The material employed was limestone cased with syenite (granite from Syene), and the internal passages were lined with granite. The granite of the casing has entirely disappeared, but that employed as linings is still in its place, and so skilfully worked that it would not be possible to introduce even a sheet of paper between the joints.

In the neighborhood of the pyramids are found a large number of tombs which are supposed to be those of private persons.

* Strictly speaking, the base is not an exact square, the four sides measuring, according to the Royal Engineers, north, 760 feet 7.5 inches; south, 761 feet 8.5 inches; east, 760 feet 9.5 inches; and west, 764 feet 1 inch.

Their form is generally that of a *mastaba* or truncated pyramid with sloping walls, and their construction is evidently copied from a fashion of wooden architecture previously existing. The same idea of making an everlasting habitation for the body prevailed as in the case of the pyramids, and stone was therefore the material employed; but the builders seem to have desired to indulge in a decorative style, and as they were totally unable to originate a legitimate stone architecture, we find carved in stone, rounded beams as lintels, grooved posts, and—most curious of all—roofs that are an almost exact copy of the early timber huts when unsquared baulks of timber were laid across side by side to form a covering.

When we come to the series of remains of the twelfth dynasty at Beni-Hassan, in middle Egypt, we meet with the earliest known examples of that most interesting feature of all subsequent styles—the column. Whether the idea of columnar architecture originated with the necessities of quarrying—square piers being left at intervals to support the superincumbent mass of rock as the quarry was gradually driven in—or whether the earliest stone piers were imitations of brickwork or of timber posts, we shall probably never be able to determine accurately, though the former supposition seems the more likely. We have here monuments of a date fourteen hundred years anterior to the earliest known Greek examples, with splendid columns, both exterior and interior, which no reasonable person can doubt are the prototypes of the Greek doric order.

Egyptian temples can be generally classed under two heads: (1) the large principal temples, and (2) the small subsidiary ones called Typhonia or Mammisi. Both kinds of temple vary little, if at all, in plan from the time of the twelfth dynasty down to the Roman dominion.

The large temples consist almost invariably of an entrance gate flanked on either side by a large mass of masonry, called a pylon, in the shape of a truncated pyramid. The axis of the ground-plan of these pylons is frequently obliquely inclined to the axis of the plan of the temple itself; and indeed one of the most striking features of Egyptian temples is the lack of regularity and symmetry in their construction. The entrance gives access to a large courtyard, generally ornamented with columns: beyond this, and occasionally approached by steps, is another court, smaller than the first, but much more splendidly adorned with columns and colossi; beyond this again, in the finest examples, occurs what is called the hypostyle hall, *i. e.*, a hall with two rows of lofty columns down the center, and at the sides other rows, more or less in number, of lower columns; the object of this arrangement being that the central portion might be lighted by a kind of clerestory above the roof of the side portions. This hypostyle hall stood with its greatest length transverse to the general axis of the temple, so that it was entered from the side. Beyond it were other chambers, all of small size, the innermost being generally the sanctuary, while the others were probably used as residences by the priests. Homer's hundred-gated Thebes, which was for so long the capital of Egypt, offers at Karnak and Luxor the finest remains of temples; what is left of the former evidently showing that it must have been one of the most magnificent buildings ever erected in any country.

It must not be imagined that this temple of Karnak, together with the series of connected temples is the result of one clearly conceived plan; on the contrary, just as has been frequently the case with our own cathedrals and baronial halls, alterations were made here and additions there by successive kings one after another without much regard to connection or congruity, the only feeling that probably influenced them being that of emulation to excel in size and grandeur the erections of their predecessors, as the largest buildings were almost always of latest date. The original sanctuary, or nucleus of the temple, was built by Useratesen I., the second or third king of the twelfth dynasty.

Extensive remains of temples exist at Luxor, Edfou, and Philæ.

It should be noticed that all these large temples have the *mastaba* form, *i. e.*, the outer walls are not perpendicular on the outside, but slope inward as they rise, thus giving the buildings an air of great solidity.

The Mammisi exhibit quite a different form of temple from those previously described, and are generally found in close proximity to the large temples. They are generally erected on a raised terrace, rectangular in plan and nearly twice as long as it was wide, approached by a flight of steps opposite the entrance; they consist of oblong buildings, usually divided by a wall into two chambers, and surrounded on all sides by a colonnade composed of circular columns or square piers placed at intervals, and the whole is roofed in. A dwarf wall is frequently found between the piers and columns, about half the height of the shaft. These temples differ from the larger ones in having the outer walls perpendicular.

The constructional system pursued by the Egyptians, which consisted in roofing over spaces with large horizontal blocks of stone, led of necessity to a columnar arrangement in the interiors, as it was impossible to cover large areas without frequent upright supports. Hence the column became the chief means of obtaining effect, and the varieties of form which it exhibits are very numerous. The sculptors appear to have imitated as closely as possible the forms of the plant-world around them. In one they represent a bundle of reeds or lotus stalks. The stalks are bound round with several belts, and the capital is formed by the slightly bulging unopened bud of the flower, above which is a small abacus with the architrave resting upon it: the base is nothing but a low circular plinth. The square piers also have frequently a lotus bud carved on them. At the bottom of the shaft is frequently found a decoration imitated from the sheath of leaves from which the plant springs. As a further development of this capital we have the opened lotus flower of a very graceful bell-like shape, ornamented with a similar sheath-like decoration to that at the base of the shaft. This decoration was originally painted only, not sculptured, but at a later period we find these sheaths and buds worked in stone. Even more graceful is the palm capital, which also had its leading lines of decoration painted on it at first, and afterward sculptured. At a later period of the style we find the plant forms abandoned, and capitals were formed of a fantastic combination of the head of Isis with a pylon resting upon it. In one part of the temple at Karnak is found a very curious capital resembling the open lotus flower inverted. The proportion which the height of Egyptian columns bears to their diameter differs so much in various cases that there was evidently no regular standard adhered to, but as a general rule they have a heavy and massive character. The wall-paintings of the Egyptian buildings show many curious forms of columns, but we have no reason for thinking that these fantastic shapes were really executed in stone.

Almost the only sculptured ornaments worked on the exteriors of buildings were the curious astragal or bead at all the angles, and the cornice, which consisted of a very large cavetto, or hollow moulding, surmounted by a fillet. These features are almost invariable from the earliest to the latest period of the style. This cavetto was generally enriched, over the doorways, with an ornament representing a circular boss with a wing at each side of it.

One other feature of Egyptian architecture which was peculiar to it must be mentioned, namely, the obelisk. Obelisks were nearly always erected in pairs in front of the pylons of the temples, and added to the dignity of the entrance. They were invariably monoliths, slightly tapering in outline, carved with the most perfect accuracy; they must have existed originally in very large numbers. Not a few of these have been transported to Europe, and at least twelve are standing in Rome, one in Paris and one in London.

ANALYSIS OF BUILDINGS.

The early rock-cut tombs were, of course, only capable of

producing internal effects; their floor presents a series of halls and galleries, varying in size and shape, leading one out of the other, and intended by their contrast or combination to produce architectural effect. To this was added in the latter rock-cut tombs a façade to be seen directly in front. Much the same account can be given of the disposition of the built temples. They possess one front, which the spectator approaches, and they are disposed so as to produce varied and impressive interiors, but not to give rise to external display. The supports, such as walls, columns, piers, are all very massive and very close together, so that the only wide open spaces are courtyards.

The circle, or octagon, or other polygonal forms do not appear in the plans of Egyptian buildings; but though all the lines are straight, there is a good deal of irregularity in spacing, walls which face one another are not always parallel, and angles which appear to be right angles very often are not so.

The later buildings extend over much space. The adjuncts to these buildings, especially the avenues of sphinxes, are planned so as to produce an air of stately grandeur, and in them some degree of external effect is aimed at.

The walls are uniformly thick, and often of granite or of stone, though brick is also met with; *e. g.*, some of the smaller pyramids are built entirely of brick. In all probability the walls of domestic buildings were to a great extent of brick, and less thick than those of the temples; hence they have all disappeared.

The surface of walls, even when of granite, was usually plastered with a thin fine plaster, which was covered by the profuse decoration in color already alluded to.

The walls of the propylons tapered from the base toward the top, and the same thing sometimes occurred in other walls. In almost all cases the stone walls are built of very large blocks, and they show an unrivaled skill in masonry.

The roofing which remains is executed entirely in stone, but not arched or vaulted. The rock-cut tombs, however, contain ceilings of an arched shape, and in some cases forms which seem to be an imitation of timber roofing. The roofing of the hypostyle hall at Karnak provides an arrangement for admitting light very similar to the clerestory of gothic cathedrals.

The openings were all covered by a stone lintel, and consequently were uniformly square-headed. The interspaces between columns were similarly covered, and hence Egyptian architecture has been, and correctly, classed as the first among the styles of trabeated architecture. Window openings seldom occur.

The columns have been already described to some extent. They are almost always circular in plan, but the shaft is sometimes channeled. They are for the most part of sturdy proportions, but great grace and elegance are shown in the profile given to shafts and capitals. The design of the capitals especially is full of variety, and admirably adapts forms obtained from the vegetable kingdom. The general effect of the Egyptian column, wherever it is used, is that it appears to have, as it really has, a great deal more strength than is required. The fact that the abacus (the square block of stone introduced between the moulded part of the capital and what it carries) is often smaller in width than the diameter of the column aids very much to produce this effect.

Mouldings are very rarely employed; in fact, the large bead running up the angles of the pylons, etc., and a heavy hollow moulding doing duty as a cornice, are all that are usually met with. Sculpture and carving occur occasionally, and are freely introduced in later works, where we sometimes find statues incorporated into the design of the fronts of temples. Decoration in color, in the shape of hieroglyphic inscriptions and paintings of all sorts, was profusely employed, and is executed with a truth of drawing and a beauty of coloring that have never been surpassed. Almost every object drawn is partly conventionalized, in the most skillful manner, so as to make it fit its place as a piece of a decorative system.

The character is gloomy, and to a certain extent forbidding, owing to the heavy walls and piers and columns, and the great masses supported by them; but when in its freshness and quite uninjured by decay or violence, the exquisite coloring of the walls and ceilings and columns must have added a great deal of beauty: this must have very much diminished the oppressive effect inseparable from such massive construction and from the gloomy darkness of many portions of the buildings. It is also noteworthy that the expenditure of materials and labor is greater in proportion to the effect attained than in any other style. The pyramids are the most conspicuous example of this prodigality. Before condemning this as a defect in the style, it must be remembered that a stability which should defy enemies, earthquakes, and the tooth of time, was far more aimed at than architectural character; and that, had any mode of construction less lavish of material, and less perfect in workmanship, been adopted, the buildings of Egypt might have all disappeared ere this.

SELECTIONS FROM AMERICAN LITERATURE.

FITZ GREENE HALLECK.

If one is not too critical there is a good deal of pleasure to be got out of Halleck's volume.—*National Magazine* (1852).

Dana, Halleck and Bryant rose together on steady wings and gave voices to the solitude; Dana with a broad, grave undertone like that of the sea; Bryant with a sound as of the wind in summer woods, and the fall of waters in mountain dells; and Halleck with strains blown from a silver trumpet, breathing manly fire and courage.—*Bayard Taylor*.

To * * * *

The world is bright before thee,
Its summer flowers are thine,
Its calm, blue sky is o'er thee,
Thy bosom pleasure's shrine;
And thine the sunbeam given,
To nature's morning hour,
Pure, warm, as when from heaven
It burst on Eden's bower.

There is a song of sorrow,
The death-dirge of the gay,
That tells, ere dawn of morrow,
These charms may melt away,
That sun's bright beam be shaded,
That sky be blue no more,
The summer flowers be faded,
And youth's warm promise o'er.

Believe it not, though lonely
Thy evening home may be;
Though beauty's bark can only
Float on a summer sea;
Though time thy bloom is stealing,
There's still beyond his art
The wild-flower wreath of feeling,
The sunbeam of the heart.

In Memory of Joseph Rodman Drake.

Green be the turf above thee,
Friend of my better days!
None knew thee but to love thee,
Nor named thee but to praise.

Tears fell when thou wert dying,
From eyes unused to weep,
And long, where thou art lying,
Will tears the cold turf steep.

When hearts whose truth was proven,
Like thine, are laid in earth,
There should a wreath be woven
To tell the world their worth;

And I, who woke each morrow
To clasp thy hand in mine,
Who shared thy joy and sorrow,
Whose weal and woe were thine,—

It should be mine to braid it
Around thy faded brow,
But I've in vain essayed it,
And feel I cannot now.

While memory bids me weep thee,
Nor thoughts nor words are free,
The grief is fixed too deeply
That mourns a man like thee.

There are some happy moments in this lone
And desolate world of ours, that well repay
The toil of struggling through it, and atone
For many a long, sad night and weary day.
They come upon the mind like some wild air
Of distant music, when we know not where,
Or whence, the sounds are brought from, and their power,
Though brief, is boundless.

RICHARD HENRY DANA.

Among the first to make a creditable appearance in the field of American literature was Richard Henry Dana, the last of the writers of his generation who achieved success both in prose and verse, and won the right to be ranked among the most vigorous authors of the first half of the present century.—*James Grant Wilson.*

From "THOUGHTS ON THE SOUL."

Turn with me from pining thought
And all the inward ills that sin has wrought;
Come, send abroad a love for all who live,
And feel the deep content in turn they give.
Kind wishes and good deeds—they make not poor;
They'll home again, full laden, to thy door.
The streams of love flow back where they begin;
For springs of outward joys lie deep within.

E'en let them flow, and make the places glad
Where dwell thy fellow-men, shouldst thou be sad,
And earth seems bare, and hours, once happy, press
Upon thy thoughts, and make thy loneliness
More lonely for the past, thou then shalt hear
The music of those waters running near;
And thy faint spirit drink the cooling stream,
And thine eye gladden with the playing beam,
That now upon the water dances. Now,
Leaps up and dances in the hanging bough.

Is it not lovely? Tell me, where doth dwell
The power that wrought so beautiful a spell?
In thine own bosom, brother? Then, as thine,
Guard with a reverent fear this power divine,
And if, indeed, 'tis not the outward state,
But temper of the soul, by which we rate
Sadness or joy, e'en let thy bosom move
With noble thoughts, and wake thee into love;
And let each feeling in thy breast be given
An honest aim, which, sanctified by heaven,
And springing into act, new life imparts,
Till beats thy frame as with a thousand hearts.

The earth is full of life; the living hand
Touched it with life; and all its forms expand
With principles of being made to suit
Man's varied powers, and raise from the brute.
And shall the earth of higher ends be full,—
Earth which thou tread'st,—and thy poor mind be dull,
Thou talk of life, with half thy soul asleep!

Thou "living dead man," let thy spirits leap
Forth to the day, and let the fresh air blow
Thro' thy soul's shut-up mansion. Wouldst thou know
Something of what is life, shake off this death;
Have thy soul feel the universal breath
With which all nature 's quick, and learn to be
Sharer in all thou dost touch or see;
Break from thy body's grasp, thy spirit's trance;
Give to thy soul air, thy faculties expanse;
Love, joy, e'en sorrow—yield thyself to all!
They make thy freedom, groveller, not thy thrall,
Knock off the shackles which thy spirit bind
To dust and sense, and set at large the mind;
Then move in sympathy with God's great whole;
And be, like man at first, A Living Soul!

A Clump of Daisies.

Ye daisies gay,
This fresh spring day
Closed gathered here together,
To play in the light,
To sleep all the night,
To abide through the sullen weather;

Ye creatures bland,
A simple band,
Ye free ones, linked in pleasure,
And linked when your forms
Stoop low in the storms,
And the rain comes down without measure;

When the wild clouds fly
Athwart the sky,
And ghostly shadows, glancing,
Are darkening the gleam
Of the hurrying stream,
And your close, bright heads gayly dancing;

Though dull awhile,
Again ye smile;
For, see, the warm sun breaking;
The stream's going glad,
There's nothing now sad,
And the small bird his song is waking.

The dew-drop sip
With dainty lip!
The sun is low descended,
And moon, softly fall
On troops true and small;
Sky and earth in one kindly blended.

And, morning! spread
Their jewelled bed
With lights in the east sky springing;
And, brook! breathe around
Thy low murmured sound!
May they move, ye birds, to your singing;

For in their play
I hear them say,
Here, man, thy wisdom borrow;
In heart be a child,
In words, true and mild;
Hold thy faith, come joy, or come sorrow.

WILLIAM CULLEN BRYANT.

Bryant's writings transport us into the depths of the solemn, primeval forest, to the shores of the lonely lakes, the banks of the wild, nameless stream, or the brow of the rocky upland, rising like a promontory from amidst a wild ocean of foliage; while they shed around us the glory of a climate fierce in its extremes, but splendid in its vicissitudes.—*Washington Irving.*

His soul is charity itself—in all respects generous and noble.—*Edgar A. Poe.*

We may have had elsewhere as faithful citizens; as industrious journalists; as ripe scholars, and poets, it may be, equally gifted and inspired, but where have we had another who has combined in his own person all these? In him a rare combination of extraordinary qualities was united; strength and gentleness, elevation of thought and childlike simplicity, genius, common-sense; and practical wisdom. Where there were controverted questions, whether men agreed with him or not, they never for an instant doubted his nobleness of purpose.—*Rev. R. C. Waterston.*

To the Fringed Gentian.

Thou blossom bright with autumn dew,
And colored with the heaven's own blue,
That openest when the quiet light
Succeeds the keen and frosty night,—

Thou comest not when violets lean
O'er wandering brooks and springs unseen,
Or columbines, in purple drest,
Nod o'er the ground-bird's hidden nest.

Thou waitest late, and com'st alone,
When woods are bare, and birds are flown,
And frosts and shortening days portend
The aged year is near its end.

Then doth thy sweet and quiet eye
Look through its fringes to the sky,
Blue, blue, as if that sky let fall
A flower from its cerulean wall.

I would that thus, when I shall see
The hour of death draw near to me,
Hope, blossoming within my heart,
May look to heaven as I depart.

Extract from Bryant's Translation of the Iliad. Book I. (620-774.)

* * * But when now, at length,
The twelfth day came, the ever-living gods
Returned together to the Olympian mount
With Jove, their leader. Thetis kept in mind
Her son's desire, and, with the early morn,
Emerging from the depths of ocean, climbed
To the great heaven and the high mount, and found
All-seeing Jove, who, from the rest apart,
Was seated on the loftiest pinnacle
Of many-peaked Olympus. She sat down
Before the son of Saturn, clasped his knees
With her left arm, and lifted up her right
In supplication to the Sovereign One:

"O Jupiter, my father, if among
The immortals I have ever given thee aid
By word or act, deny not my request.
Honor my son, whose life is doomed to end
So soon; for Agamemnon, king of men,
Hath done him shameful wrong: he takes from him
And keeps the prize he won in war. But thou,
Olympian Jupiter, supremely wise,
Honor him now, and give the Trojan host
The victory, until the humbled Greeks
Heap large increase of honors on my son."

She spake, but cloud-compelling Jupiter
Answered her not; in silence long he sat.
But Thetis, who had clasped his knees at first,
Clung to them still, and prayed him yet again:—

"O promise me, and grant my suit; or else
Deny it,—for thou need'st not fear,—and I
Shall know how far below the other gods
Thou holdest me in honor." As she spake,
The cloud-compeller, sighing heavily,

Answered her thus: "Hard things dost thou require,
And thou wilt force me into new disputes
With Juno, who will anger me again
With contumelious words; for ever thus,
In presence of the immortals, doth she seek
Cause of contention, charging that I aid
The Trojans in their battles. Now depart,
And let her not perceive thee. Leave the rest
To be by me accomplished; and that thou
Mayst be assured, behold, I give the nod;
For this, with me, the immortals know, portends
The highest certainty: no word of mine
Which once my nod confirms can be revoked,
Or prove untrue, or fail to be fulfilled."

As thus he spake, the son of Saturn gave
The nod with his dark brows. The ambrosial curls
Upon the Sovereign One's immortal head
Were shaken, and with them the mighty mount
Olympus trembled. Then they parted, she
Plunging from bright Olympus to the deep,
And Jove returning to his palace home;
Where all the gods, uprising from their thrones,
At sight of the Great Father, waited not
For his approach, but met him as he came.

And now upon his throne the Godhead took
His seat, but Juno knew—for she had seen—
That Thetis of the silver feet, and child
Of the gray Ancient of the Deep, had held
Close counsel with her consort. Therefore she
Bespoke the son of Saturn harshly, thus:—

"O crafty one, with whom, among the gods,
Plottest thou now? Thus hath it ever been
Thy pleasure to devise, apart from me,
Thy plans in secret; never willingly
Dost thou reveal to me thy purposes."
Then thus replied the Father of the gods
And mortals: "Juno, do not think to know
All my designs, for thou wilt find the task
Too hard for thee, although thou be my spouse.
What fitting is to be revealed, no one
Of all the immortals or of men shall know
Sooner than thou; but when I form designs
Apart from all the gods, presume thou not
To question me or pry into my plans."

Juno, the large-eyed and august, rejoined:—
"What words, stern son of Saturn, hast thou said!
It never was my wont to question thee
Or pry into thy plans, and thou art left
To form them as thou wilt; yet now I fear
The silver-footed Thetis has contrived—
That daughter of the Ancient of the Deep—
To o'erpersuade thee, for, at early prime,
She sat before thee and embraced thy knees;
And thou hast promised her, I can not doubt,
To give Achilles honor and to cause
Myriads of Greeks to perish by their fleet."

Then Jove, the cloud-compeller, spake again:—
"Harsh-tongued! thou ever dost suspect me thus,
Nor can I act unwatched; and yet all this
Profits thee nothing, for it only serves
To breed dislike, and is the worse for thee.
But were it as thou deemest, 't is enough
That such has been my pleasure. Sit thou down
In silence, and obey, lest all the gods
Upon Olympus, when I come and lay
These potent hands on thee, protect thee not."

He spake, and Juno, large-eyed and august,
O'erawed, and curbing her high spirit, sat
In silence; meanwhile all the gods of heaven
Within the halls of Jove were inly grieved.

HENRY WADSWORTH LONGFELLOW.

A man of true genius.—*Edgar A. Poe.*

A man's heart beats in his every line.—*George Gilfillan.*

Of all our poets Longfellow best deserves the title of artist.—*Griswold.*

They (Longfellow's poems) appear to me more beautiful than on former readings, much as I then admired them. The exquisite music of your verses dwells more agreeably than ever on my ear, and more than ever am I affected by their depth of feeling and their spirituality, and the creative power with which they set before us passages from the great drama of life.—*William Cullen Bryant in letter to Longfellow.*

Santa Filomena.

When'er a noble deed is wrought,
When'er is spoken a noble thought,
Our hearts, in glad surprise,
To higher levels rise.

The tidal wave of deeper souls
Into our inmost being rolls,
And lifts us unawares
Out of all meaner cares.

Honor to those whose words or deeds
Thus help us in our daily needs,
And by their overflow
Raise us from what is low!

Thus thought I, as by night I read
Of the great army of the dead,
The trenches cold and damp,
The starved and frozen camp,—

The wounded from the battle-plain,
In dreary hospitals of pain,
The cheerless corridors,
The cold and stony floors.

Lo! in that house of misery
A lady with a lamp I see
Pass through the glimmering gloom,
And flit from room to room.

And slow, as in a dream of bliss,
The speechless sufferer turns to kiss
Her shadow, as it falls
Upon the darkening walls.

As if a door in heaven should be
Opened and then closed suddenly,
The vision came and went,
The light shone and was spent.

On England's annals, through the long
Hereafter of her speech and song,
That light its rays shall cast
From portals of the past.

A Lady with a Lamp shall stand
In the great history of the land,
A noble type of good,
Heroic womanhood.

Nor even shall be wanting here
The palm, the lily, and the spear,
The symbols that of yore
Saint Filomena bore.

Rural Life in Sweden.

There is something patriarchal still lingering about rural life in Sweden, which renders it a fit theme for song. Almost primeval simplicity reigns over that Northern land—almost primeval solitude and stillness. You pass out from the gate of the city, and, as if by magic, the scene changes to a wild, woodland landscape. Around you are forests of fir. Overhead

hang the long, fan-like branches, trailing with moss, and heavy with red and blue cones. Under foot is a carpet of yellow leaves; and the air is warm and balmy. On a wooden bridge you cross a little silver stream; and anon come forth into a pleasant and sunny land of farms. Wooden fences divide the adjoining fields. Across the road are gates, which are opened by troops of children. The peasants take off their hats as you pass; you sneeze, and they cry, "God bless you!" The houses in the villages and smaller towns are all built of hewn timber, and for the most part painted red. The floors of the taverns are strewn with the flagrant tips of fir boughs. In many villages there are no taverns, and the peasants take turns in receiving travelers. The thrifty housewife shows you into the best chamber, the walls of which are hung round with rude pictures from the Bible; and brings you her heavy silver spoons—an heirloom—to dip the curdled milk from the pan. You have oaten cakes baked some months before, or bread with anise-seed and coriander in it, or perhaps a little pine bark.

Meanwhile the sturdy husband has brought his horses from the plough, and harnessed them to your carriage. Solitary travelers come and go in uncouth one-horse chaises. Most of them have pipes in their mouths, and, hanging around their necks in front, a leather wallet, in which they carry tobacco, and the great bank-notes of the country, as large as your two hands. You meet, also, groups of Dalekarian peasant-women, traveling homeward or townward in pursuit of work. They walk barefoot, carrying in their hands their shoes, which have high heels under the hollow of their foot, and soles of birch bark.

Near the churchyard gate stands a poor-box, fastened to a post by iron bands, and secured by a padlock, with a sloping wooden roof to keep off the rain. If it be Sunday, the peasants sit on the church steps and con their psalm-books. Others are coming down the road with their beloved pastor, who talks to them of holy things from beneath his broad-brimmed hat. He speaks of fields and harvests, and of the parable of the sower, that went forth to sow. He leads them to the Good Shepherd, and to the pleasant pastures of the spirit-land. He is their patriarch, and, like Melchizedek, both priest and king, though he has no other throne than the church pulpit. The women carry psalm-books in their hands, wrapped in silk handkerchiefs, and listen devoutly to the good man's words. But the young men, like Gallio, care for none of these things. They are busy counting the plaits in the kirtles of the peasant girls, their number being an indication of the wearer's wealth. It may end in a wedding.

Nor must I forget the suddenly changing seasons of the Northern clime. There is no long and lingering spring, unfolding leaf and blossom one by one; no long and lingering autumn, pompous with many-colored leaves and the glow of Indian summers. But winter and summer are wonderful, and pass into each other. The quail has hardly ceased piping in the corn, when winter from the folds of trailing clouds sows broadcast over the land snow, icicles, and rattling hail. The days wane apace. Ere long the sun hardly rises above the horizon, or does not rise at all. The moon and the stars shine through the day; only, at noon, they are pale and wan, and in the southern sky a red, fiery glow, as of sunset, burns along the horizon, and then goes out. And pleasantly under the silver moon, and under the silent, solemn stars, ring the steel-shoes of the skaters on the frozen sea, and voices, and the sound of bells.

Passages from Longfellow.

If you borrow my books do not mark them, for I shall not be able to distinguish your marks from my own, and the pages will become like the doors in Bagdad, marked by Morgiana's chalk.

A torn jacket is soon mended; but hard words bruise the heart of a child.

THE CATHEDRAL OF ROUEN.—I unexpectedly came out in front of the magnificent cathedral. If it had suddenly risen from the earth the effect would not have been more powerful and instantaneous. It completely overpowered my imagination; and I stood for a long time motionless, gazing entranced upon the stupendous edifice. I had before seen no specimen of Gothic architecture, save the remains of a little church at Havre, and the massive towers before me, the lofty windows of stained glass, the low portal, with its receding arches and rude statues, all produced upon my untrained mind an impression of awful sublimity. When I entered the church the impression was still more deep and solemn. It was the hour of vespers. The religious twilight of the place, the lamps that burned on the distant altar, the kneeling crowd, the tinkling bell, and the chant of the evening service that rolled along the vaulted roof in broken and repeated echoes, filled me with new and intense emotions. When I gazed on the stupendous architecture of the church, the huge columns that the eye followed up till they were lost in the gathering dusk of the arches above, the long and shadowy aisles, the statues of saints and martyrs that stood in every recess, the figures of armed knights upon the tombs, the uncertain light that stole through the painted windows of each little chapel, and the form of the cowed and solitary monk, kneeling at the shrine of his favorite saint, or passing between the lofty columns of the church—all I had read of, but had not seen—I was transported back to the Dark Ages, and felt as I can never feel again.—*Outre-Mer*.

Bear through sorrow, wrong and ruth,
In thy heart the dew of youth,
On thy lips the smile of truth. —*Maidenhood*.

As turning the logs will make a dull fire burn, so change of studies a dull brain.

If we could read the secret history of our enemies, we should find in each man's life sorrow and suffering enough to disarm all hostility.

We often excuse our want of philanthropy by giving the name of fanaticism to the more ardent zeal of others.

[End of Required Reading for January.]

NIGHT.

By A. ST. J. A.

I saw the sun sink slowly in the west,
Painting the cloudless skies with liquid gold;
I saw the angel of the night unfold
His dewy wings, and lowly o'er his breast
Bow down his head in meek humility,
As one who works his Master's wise behest.
I saw the moon in radiant garb uprise
And sail majestic o'er the tranquil skies,
Like some bright vessel on a waveless sea.
And as I gazed, a sense of perfect rest
Stole o'er me, and the sorrows that infest
The life of all no longer burdened me,
But, with the light, fled peacefully away.

Ceased had the plaintive carol of the thrush,
And stillness brooded over everything,
As if the dark-robed angel had unfurled
His ebon pinions and, from off his wing,
Shook silence down upon a sleeping world;
Or the last sigh of the departing day,
Borne through the trees in one long-whispered "Hush!"
Had breathed o'er all a spirit of repose.

So may life's sun, which at the dawn uprose
Resplendent in its ever-growing light,
In peaceful glory sink at evening's close
Beyond the margin of death's silent sea,
And the grey shadows of that wondrous night,
Which ends in day eternal, fall on me.

ECCENTRIC AMERICANS.

By COLEMAN E. BISHOP.

III.—THE MORBID STATESMAN.

A study in morbid anatomy! John Randolph, of Roanoke, might have said, with *Mrs. Gummidge*, "everything goes contrary with me;" for not only every quality of his nature, but all the circumstances of his life conspired to create in him a sum of unhappiness not often concentrated upon one individual; and this, notwithstanding his opportunities for usefulness were exceptionally good, his career brilliant, his abilities of the highest order, and his motives in the main praiseworthy. To understand such untoward results flowing from such conditions we must as well know his surroundings as study his character.

John Randolph was born, near Petersburg, Va., June 2, 1773,—a subject of George III. He was descended on his father's side from an old English family; on the other side from an older American family—a royal line, too, viz: that of Pocahontas, the Indian princess, by Captain Rolfe. In this fusion and confusion of blood can probably be found the cause of much disease in him, and of that decay of his family which brought such disappointment and disaster to his most cherished hopes. Indian blood showed itself in his swarthy complexion and straight black hair, in his placing one foot straight before the other in walking, and in his vengeful temper. The Randolphs led in the effort of Virginia planters to transplant the manners and institutions of the English aristocracy to the new country, with the very important difference that the American aristocracy was to be rooted in African slavery. This solecism was adhered to by the Randolphs after most of the other first families of Virginia had learned theories of government more American and more democratic. Such dreamers desired to have the English laws of entail and primogeniture reenacted by the Virginia legislature; defended slavery after it had become a burden and a loss to them, and had sunk Virginia from the first to the eighth rank among the states; and they advocated state-sovereignty to the last. Their conservatism became obstruction against all changes. Randolph condensed their theory of government into the famous aphorism, "a wise and masterly inactivity," which his sympathetic biographer, as late as 1850, declared "embraces the whole duty of American statesmen." So they were forced along with the progress of the country, backward—as the cattle went into the cave of Cacus—and with despairing gaze turned toward the receding past. "The country is ruined past redemption; it is ruined in the spirit and character of the people," cried Randolph, when he found that the United States would not turn back, and he said he would leave the country if he could sell out and knew where to go. Hence, we find Randolph going through his varied political career, protesting like Hamlet:

"The times are out of joint. O, cursed spite,
That ever I was born to set them right."

He was the last man to set anything right, having been born wrong himself. A more delicate, high-strung, untuned human instrument was never set up; it was, moreover, set in a frame out of order in every part. A skin as thin and delicate as a girl's; nerves all on the surface; a remarkably precocious intellect of poetic cast; proud and affectionate in disposition, and "a spice of the devil in his temper," as he said. "A spice!" This was a mild term (a thing Randolph was not often chargeable with using) to apply to a person who at the age of four years would fly into such a passion as to swoon away and remain for some time unconscious. Every function of his organism seemed to be influenced by his mood; his mood responded like a thermometer to his environment; disappointment or mental disturbance would upset the whole machine. Thus natural poetry, sweetness and affection were "like sweet bells jangled, out of tune and harsh;" and body and mind became in

harmony morbid—almost the only harmony in his organization.

Life, at its best, jars harshly on such natures; but it dealt with the unfortunate Randolph with a severity that might have appalled and broken down a strong and healthy nature. Nothing but physical and moral courage as extraordinary as the rest of his qualities could have carried him through sixty years of pent-up purgatory. While an infant he lost his father; and his mother ("the only human being who ever knew me") was taken away when he was fifteen. The sensitive, irritable, delicate child was left to "rough it" alone.

A succession of blows destroyed the dearest object of his life—the transmission of the family name and estates. One brother, Theodorick, died three years after his mother (1791), and three years later the eldest brother, Richard, the pride and hope of the family. The perpetuation of the line rested then on John and Richard's two infant sons. John Randolph nursed these carefully to manhood, only to see one of them become a hopeless madman from disappointment in love, and the other sicken and die with consumption.

Meanwhile Randolph had himself received a wound which at once blasted his own happiness, and cut off the last hope of succession through himself. He loved; something, we know not what, came between him and his affianced and she married another. Undoubtedly a man of his intense and self-repressed nature threw into this passion extraordinary abandon. At least he never recovered from the disappointment and never married—though, be it said to his credit, cynical as he was, he retained through life the most profound respect for women, and found in their society the only alleviation of his lot. Late in life he wrote: "There was a volcano under my ice, but it is burnt out. The necessity of loving and being beloved was never felt by the imaginary beings of Rousseau's and Byron's creation more imperiously than by myself." Randolph erected a cabin for himself among those of his slaves and there, when not in Congress or traveling abroad he spent his life in solitude, brooding over his misery and ruin, as wretched a recluse and misanthrope as ever breathed out a painful, hopeless existence.

To complete the sad picture, give the hapless victim of himself and circumstances a deeply religious nature and take away the consolations of hope and faith. This last drop was added to the cup and he sipped its dregs all his life. He brought his wonderful intellectual powers to bear on this subject; read, studied, thought, brooded, agonized over it in pursuit of spiritual peace; went through all the variations of skepticism, contrition, hope, despair, conversion, and relapse. Such an analytical mind coupled with a quick and self-depreciating conscience, a high ideal of religious experience, and a downright honesty of purpose could not compromise with its own extreme demands, could accept of no doubtful convictions or half-conversion. The very desire for salvation might seem selfish and unworthy to an unhealthy nature; the failure to feel, to live all that others profess (often without feeling) becomes to it conclusive evidence of the hopeless, forever-lost condition of self. Doubt brought self-condemnation for doubting; self-condemnation in turn brought new doubts. So, in a fog, he traveled perpetually in a circle.

But, through all these years of struggle and misery John Randolph was a just, a pure, a benevolent man, and he discharged his private and public duties with a fidelity and devotedness that they of sound mind and body might well emulate. The contrasts of mood and act of such a man were many and strong; they got him the credit of being crazy, and of being most so when he was most himself—such is the world's usual perception of eccentricity.

The personal appearance of the man, however, encouraged this idea: Tawny complexion, tall thin form, spindle shanks, long hair in a queue, large, black, glowing eyes, pointed chin, beardless face, small effeminate hands, long tapering fingers,

and, above all, a voice shrill, piercing, sonorous and magnetic as a woman's. He dressed in drab or buck-skin breeches, with blue coat and white top-boots, or large buckled shoes. His manner was courteous and attractive to the few whom he regarded as his equals; to the rest of mankind he was dignified and reserved; to no one did he permit familiarity. A man introduced himself to Randolph as Mr. Blunt. "Blunt?" said he with a piercing and repellant glance; "*Blunt!* Ah, I should say so!"

Another stranger addressed him in Washington: "Mr. Randolph, I am just from Virginia; I passed your house a few days ago?" "Thank you, I hope you always will," was the only encouragement the advance received.

Yet, in England, Randolph was thought very approachable and genial. An introduction was not necessary to an acquaintance at all. Perhaps the difference was largely in his health, which was better abroad.

John Randolph first came into prominence in politics in 1798, by the daring act of opposing on the stump the idol of Virginia, the venerable Patrick Henry. Henry took grounds against the State upon its nullification of the laws of the United States, although he had always been an extreme States-rights man. Young Randolph—then aged twenty-five—astounded everybody by daring to meet such a champion; but he had Henry's former record in his favor, and he made a speech of such power that it carried him into the House of Representatives. Referring to these two men, the happy expression was used, "The Rising and the Setting Sun." Henry died soon after.

Randolph took his seat in December, 1799. When he advanced to the Speaker's desk to take the oath, the clerk, moved by his youthful and singular appearance, asked, "Are you old enough to be eligible?" "Ask my constituents," was the only reply his State pride allowed him to make. In one month Randolph had become one of the best marked men of the nation. He broke with the administration of his party under Jefferson on "the Yazoo business"—a bit of early official corruption that rivals anything disclosed in later times. His opposition to the anti-English measures of Madison's administration, and to the war of 1812, cost him his re-election, and he was retired. Henry Clay's star was rising, and a new era was dawning. "The American system" of internal improvements, protection, manufactures, and Federal supremacy was taking shape. The irrepressible conflict of State *versus* Federal powers, had begun under Clay and Randolph—a conflict destined to lead to the duel between these two leaders, and ultimately to be appealed to the arbitrament of civil war.

Defeat cut John Randolph more deeply than it did David Crockett under similar circumstances. Randolph retired to his cabin and brooded; misanthropy gnawed like the vulture at the vitals of Prometheus bound. He longed for human sympathy, and was too proud to accept of it when proffered. It was during this season of disappointment and isolation that his severest religious discipline and the hope of conversion came; then also came the last sundering of his hopes of a lineal successor. "This business of living," he said, "is dull work. I possess so little of pagan philosophy or of Christian patience as to be frequently driven to despair. * * I look forward without hope. * * I have been living in a world [in Washington] without souls, until my heart is dry as a chip, and cold as a dog's nose."

In 1815 Randolph rode into Congress again on the wave of reaction against the war and its burdens, and remained in the House until 1826, when he was elected to the Senate to fill a vacancy. His antagonism against Henry Clay reached a dangerous point in the struggle over the Missouri Compromise of 1820.

Randolph went to England in 1822. He took with him large quantities of books and magazines to be bound, as he would not "patronize our Yankee task-masters, who have caused such a heavy duty to be imposed on foreign books. I shall employ John Bull to bind my books until the time arrives when they

can be properly done south of Mason and Dixon's line." He was received with much honor by all classes in England, where his stout championship of English ideas was well known. His singular appearance was heightened by his very great emaciation, and by a big fur cap with a long fore-piece which he wore. But the splendid intellect, fine manners, and brilliant conversational powers which shone out of this grotesqueness, made him even more noted.

The issue of the Presidential election of 1825 was the occasion of the Randolph-Clay duel. There had been no choice by the people, and the election went to the House of Representatives. Adams, Crawford, Clay and Jackson were the candidates. Clay's friends threw the election to John Quincy Adams. When the latter made up his cabinet, Clay's name appeared at the head, as Secretary of State. The disappointed friends of Jackson and Crawford immediately made charges of a bargain between Adams and Clay, but no one dwelt on it with such persistence and bitterness of invective as Randolph. In a speech in the Senate in 1826, he referred to Adams and Clay as "the coalition of Blifil and Black George—the combination, unheard of till then, of the *Puritan* with the *blackleg*." He also charged Clay with forging or falsifying certain state documents which had been furnished the Senate. A challenge from Clay promptly followed, and was as promptly accepted, Randolph refusing to disclaim any personal meaning as to Clay.

"The night before the duel," says General James Hamilton, of South Carolina, "Mr. Randolph sent for me. I found him calm, but in a singularly kind and confiding mood. He told me he had something on his mind to tell me. He then remarked, 'Hamilton, I have determined to receive, without returning, Clay's fire; nothing shall induce me to harm a hair of his head; I will not make his wife a widow, or his children orphans. Their tears would be shed over his grave; but when the sod of Virginia rests on my bosom, there is not in this wide world one individual to pay tribute upon mine.' His eyes filled, and resting his head upon his hand, we remained some moments silent."

All efforts to dissuade him from sacrificing himself were unavailing; but he appeared on the "field of honor" in a huge dressing-gown, in which the *locale* of his attenuated form was as well hidden as it would have been in a hog's head. Clay fired, and the ball passed through the gown where it was reasonable to suppose its wearer to be, but in fact was not. Randolph fired his shot in air, and then, approaching Clay he vehemently called out in his shrill voice, "Mr. Clay, you owe me a cloak, sir, you owe me a cloak!" at the same time pointing to the hole in that wrap. Clay replied with much feeling, pointing to Randolph's breast, "I am glad I am under no *deeper* obligation. I would not have harmed you for a thousand worlds." This ended the encounter, but not the enmity, at least on Randolph's part, as it was a matter of patriotic principle with him.

In 1827 he was again elected to the House, and immediately became the leader of the opposition, then called the Republican party. His speeches were numerous, and furnish some of the finest specimens of American eloquence. Many of his startling phrases became permanent additions to the list of Americanisms, as "bear-garden" (applied to the House of Representatives), and "dough-faces" (trickling Northern politicians). He was remarkable for eclecticism of words and careful accuracy of pronunciation.

When Jackson issued his famous proclamation against the South Carolina nullifiers, Randolph arose from his sick bed and actively canvassed the district, making inflammatory speeches from his carriage to arouse a public sentiment against the proclamation and its author—as if a skeleton, uttering a voice from the grave, had come back to awaken the living. Then we hear of him at the Petersburg races, making a speech and betting on the horses. It was probably on this occasion that he made the retort to a sporting man. Randolph excitedly offered a certain wager on one of the horses. A stranger proposed to take the bet, saying, "My friend Thompson here will hold the stakes." "Yes," squealed the skeleton

statesman, suspiciously, "and who will hold Thompson?"

But the end was drawing on. Ill as he was, he made preparations to go abroad again, and in May, 1833, started for Philadelphia to take passage.

On the boat thence to Philadelphia the dying man—for such now he was—ate heartily of *fried clams*, asked an acquaintance to read for him and criticised every incorrect accent or pronunciation, and talked freely about men, measures, and especially about his horses, which were very fast. The closing scene took place in Philadelphia, in a hotel, among strangers,—fit finale of his desolate, homeless life.

He lingered several days, during which time he took, with great care, the necessary legal steps to confirm his will for the manumission of his slaves. This finally done, he seemed to feel easier in mind and body. The account of the strange end of the eventful history proceeds:

He now made his preparations to die. He directed John to bring him his father's breast button; he then directed him to place it in the bosom of his shirt. It was an old-fashioned, large-sized gold stud. John placed it in the button hole of the shirt bosom—but to fix it completely required another hole on the other side. "Get a knife," said he, "and cut one." A napkin was called for, and placed by John, over his breast. For a short time he lay perfectly quiet, with his eyes closed. He suddenly roused up and exclaimed:

"Remorse! REMORSE!"

It was thrice repeated—the last time, at the top of his voice, with great agitation. He cried out, "Let me see the word. Get a dictionary! Let me see the word!"

"There is none in the room, sir."

"Write it down then—let me see the word."

The Doctor picked up one of his cards, "Randolph, of Roanoke." "Shall I write on this?"

"Yes; nothing more proper."

The word *remorse* was then written in pencil. He took the card in a hurried manner, and fastened his eyes on it with great intensity. "Write it on the back," he exclaimed. It was so done and handed him again. He was extremely agitated.

"Remorse! you have no idea what it is; you can form no idea of it whatever; it has contributed to bring me to my present situation. But I have looked to the Lord Jesus Christ, and hope I have obtained pardon. Now let John take your pencil and draw a line under the word," which was accordingly done.

"What am I to do with the card," inquired the Doctor.

"Put it in your pocket, take care of it, and when I am dead, look at it."

The dying man was propped up in the bed with pillows, nearly erect. Being extremely sensitive to cold, he had a blanket over his head and shoulders; and he directed John to place his hat on over the blanket, which aided in keeping it close to his head.

The scene was soon changed. Having disposed of that subject most deeply impressed on his heart, his keen, penetrating eye lost its expression, his powerful mind gave way, and his fading imagination began to wander amid scenes and with friends that he had left behind. In two hours the spirit took its flight, and all that was mortal of John Randolph of Roanoke was hushed in death. At a quarter before twelve o'clock, on the twenty-fourth day of June, 1833, aged sixty years, he breathed his last, in a chamber of the City Hotel, Philadelphia.

From the very necessities of the nature of an Eccentric, John Randolph could not be in harmony with the time in which he lived. But this difference was intensified into enmity by the irritable nature of his mind and the diseased condition of his body; nay, by his very virtues and genius. To increase the enmity and his own misfortune, he threw himself with ardor upon the losing side of an irrepressible conflict in government. I think posterity is better prepared to do him justice than were his contemporaries, for we have passed a settlement of the political conflict, and from pitying hearts can make full allowance for Randolph's unhappy nature and unfortunate lot, while recognizing the purity, honesty and heroism of his character. Which of us would have been a better man in his situation?

THE STORK.

Translated from the Swedish, for THE CHAUTAUQUAN.*

An isle there is in airy distance
Where rise green forests, grim and tall,
Its name eludes one with persistence,
But occupied with genie small;
The dewy air is dawn's fresh greeting,
And drowsy waves the reeds are beating,
There poppies grow, and lilies rare,
These only really thriving there,
But crimson-booted stork there feedeth,
To earthly mothers children leadeth.

In poppy scent with lilies vieing,
He gently flaps at water's brink,
To capture chubby genie trying,
And begs them not to fear or shrink.
The bantlings, in whose souls are blended
Fragrance from both flowers expended,
Which makes the tender sense appear
In these both slumbering and clear,
Around the snowy stork would rally,
And ventured not, but wished to dally.

"Come here, come here," a voice then crying,
The stork soon ruffles up his frill,
He sees two tiny urchins flying
So near as to be touched at will.
But oh, what wings, now waving lightly!
And feathers too, these shifting brightly
In green, as light as young birch leaves
When spring its bath of dew receives,
In red, as pale a hue revealing,
As streak at dawn, the mist concealing!

At night they breast to breast had slumbered,
In moonbeams' silver veil did lie
On poppy-bed by waves unnumbered,
To angels' sweetest lullaby.
Now stand they fresh as early morning,
In sprightly mood, all dullness scorning.
One cries, "Come, long-legs, come to me!"
The stork looks round quite loftily,
And straightway to the youngsters striding,
He asks them, "Do ye feel like riding?"

The boy then answers, "I would try it,
So on thy back pray let me sit!
On earth 'tis lovely, none deny it,
But be not ugly—gently flit!"
And up on snowy plumage springing,
A shower of down around him flinging,
Sat firm. The stork asked, "Lassie, thou,
Wilt thou not also travel now
And be a child to some good mother?"
But no—too timid, shy, this other.

They started off. The pleasure craving,
So free and wild on stork he flew,
And to his sister farewell waving,
Until at last was lost to view.

And she whose fear her trip prevented,
Now wished to be along, repented.
She felt so lonely, was not glad,
And when next year the stork she had,
Who late and early came and started,
Her wish to ride next time imparted.

He answered, "Come then, naught detaining!
'Twas stupid to refuse last year;
Not now the same good mother gaining
As he, the boy thou held so dear,
For she beneath the turf is sleeping;
But come, my little dove, now keeping
Most careful hold around my neck,
And scream not till our course we check!"
And round his neck her arms she twineth,
And heaven's winds his flight assigneth.

On earth they grew up well protected,
The boy to manhood had attained,
A beauteous maiden, she, perfected,
When first they met, as seemed ordained.
Were early memories, reviving,
To draw them soul to soul now striving?
Was it the roguish stork, oh say,
That thus together brought their way?
I think that fate great fondness bore them,
When choosing different mothers for them.

But thou shouldst see the cot so sightly,
The woodland home in which they dwell!
The cause of it I know not rightly
Why storks just there should thrive so well,
And *one* especially, who hovers
On roof which inner chamber covers,
And goes and flaps with all his might
So crimson-booted, silver-white,
And best she worked, the mother hinted,
When he had sticks and straws unstinted.

Each fall he goes, the habit keeping,
But seen each spring again on roof,
From there o'er house and garden peeping;
And can I judge, or take as proof
The children I have seen there playing,
Full often has the stork been straying
To that fair poppy-covered isle,
And now brings lass with winsome smile,
And now a lovely boy, a treasure;
This must afford him constant pleasure.

As pedagogue he struts hereafter,
And trousers of the boys he pecks
With bill, rewarded then with laughter,
If naughtiness or prank detects;
But yet for their protection striving,
And serpents from the garden driving,
And patiently will he comply
When "Long-legs, come!" the children cry.
Each eve from thatch so closely heeding,
If they the psalms are nicely reading.

The art of reading is to skip judiciously. Whole libraries may be skipped in these days, when we have the results of them in our modern culture without going over the ground again. And even of the books we decide to read, there are almost always large portions which do not concern us, and which we are sure to forget the day after we have read them. The art is to skip all that does not concern us, whilst missing nothing that we really need. No external guidance can teach us this, for nobody but ourselves can guess what the needs of our intellect may be. But let us select with decisive firmness, independently of other people's advice, independently of the authority of custom. In every newspaper that comes to hand there is a little bit that we ought to read; the art is to find that little bit, and waste no time over the rest.—*Philip G. Hamerton*

*This translation was made by Miss Marie A. Brown, a lady now in Sweden studying its poetry and preparing a volume of translations for American readers. "The Stork," from C. D. of Wirsén, is among the most popular Swedish poems.—[Ed

GARDENING AMONG THE CHINESE

Translated for THE CHAUTAUQUAN, from "Revue des Deux Mondes."

A French physician, M. Martin, who has for several years been an attaché of the French ambassador at Peking, calls the Chinese the authors of the art of gardening. Since the earliest times their leaders have had the wisdom to have cultivated not only ornamental plants, but as well those which would increase the resources of the inhabitants. Their vast enclosures have often been the nurseries of the provinces, and to excite the ambition of their subjects, the rulers award prizes on many public occasions to those who present to them new flowers or fruits. Our societies of horticulture do no better. The annals of the Tsing dynasty mention mandarins whose business it was to care for the gardens of the emperor, and especially to look after the bamboos. The taste for flowers increased by the encouragement of the authorities gives an astonishing commercial value to certain plants. The *sambac*, whose flowers have at once the odor of the rose and of the orange, as blended in the common jasmine, is used to perfume tea, liquors, syrups and preserves; at Peking a very small branch is worth from ten dollars to twelve dollars and upwards. An *asclepias*, which gives its perfume only at night, has been sold for twenty and thirty ounces of silver, and each year the viceroy of the province of Tche-kiang sends several cuttings of it to Peking for the apartments of the emperor. In order to profit by so lucrative a taste, Chinese horticulture has been for the most part spent in trying to make the most of the treasures of their flora. To this flora we owe the chief of our ornamental flowers—the Chinese pink, sent in 1702 to the Abbé Bignon, and first described in 1705; the aster, sent out in 1728, and which received from a committee of amateurs the name of Queen Marguerite; our autumn chrysanthemum, which for a long time figured on the coat of arms of the emperors; the dicentra (or "bleeding heart"), whose rosy spurred cups look like a double shield; the Chinese rose; the Chinese honeysuckle, whose original name signifies "the gold and silver flower," in reference to its various colors; the begonia, green above and provided with purple veins below; our camellia, which the Chinese call the tea-flower; finally, a flower which we call the isle of Guernsey, because the vessel which brought the bulbs of this elegant amaryllis into England having been shipwrecked in sight of its country, the bulbs, carried by the waves on to the sandy shores of the isle, took root there and were kept alive in the pleasant temperature.

The taste of these Orientals is very different from ours. We are disagreeably affected by the care which they take to diminish the height of all vegetation. The missionaries assure us that they have seen cypresses and pines which were not more than two feet in height, although forty years old, and well proportioned in all their parts. It is one way of obtaining a great number of types in a narrow space, which is precious in a country where the gardens are so elegant and the ownership so divided. It is one of the results of the culture of the family life, and if a stranger is but little pleased by these stunted forms he is, at least, able to extract a moral upon the infinite patience which has produced them. By energy and will they direct as they wish the most obstinate plants, and in their flower-beds imitate lakes, rocks, rivers, and even mountains.

But they have as well their landscape gardens: they are around tombs, and especially the pagodas, those centers of civilization which are at once places of prayer, store-houses for the harvests of the simple, and grazing grounds for the preservation of quadrupeds. It is in these gardens of the extreme East that one sees those avenues of bamboos, whose knots hollowed out leave niches for idols; then there are magnificent specimens of the great thuja of the East, whose sweet-scented imperishable wood is used for making coffins, and reduced to powder is made into aromatic chopsticks, which are burnt be-

fore the statues of their divinities; the fir-tree, with long cones, a native of the northeast; the oak, with leaves like the chestnut tree, and which bears the mistletoe in China; the weeping willow and the funeral cypress, whose bright leaves stand out against the black background of the pines; the *Pinus bungeana*, which grows to an enormous size, and whose trunk becomes so white with age that it might easily pass for limestone. We can not describe the effect of this grand, severe vegetation, intermingled with marble statues and columns, surrounding the lofty conical roofs of the pagodas.

In no country of Europe are the gardeners so skillful in multiplying and cultivating. They have processes of their own. Our gardeners do not know how to use half-rotten planks, which they pierce with holes, fill with earth, and use in the germination of the cutting; when the plant begins to grow they break away the plank. We are far from practicing grafting in their bold style; this horticultural operation is performed among the Chinese in very different ways. They graft successfully the chrysanthemum on the wormwood, the oak on the chestnut, the grape on the jujube tree. These feats, which shock the customs of our horticulturists and even the convictions of our botanists, recall those which the good Pliny relates, and for which he has been charged with ignorance and hyperbole.

Their cleverness in gardening has one outlet of which we are ignorant. We cut our boxwood, and do not save it for the Palm-Sunday festival. The Chinese cultivate plants for holy purposes. The ponds and other bodies of water so numerous in a country where rice is the chief food, gives them opportunity to cultivate in abundance a magnificent water plant, the lotus of the Indus, the sacred plant of the Hindoos. The god Buddha is always represented reposing on the lotus flower, whose root signifies vigor, its great leaves growth, its odor the sovereign spirit, its brilliancy love. Thus it is customary to offer to the idols the beautiful flowers of the lotus; besides, its culture offers a double advantage, its fruitful root and its sweet grains (the beans of Egypt) being used in Chinese cookery. The fruit of one variety of the lemon tree is produced from the separated carpels, which are disjoined at the base of the lemon and developed separately, like the fingers of a hand. This hand is among the Chinese that of their god; *Fo-chou-kan*, as it is called, signifies the sweet smelling hand of Buddha. A writer assures us that the gardeners aid, by bands which are early fastened on the fruit, in bringing about this paying division; they are capable of it.

This union of two very different feelings, the greed for gain and piety, ought not to astonish us much. The simple affection which they have for plants seems to be a kind of religious sentiment. Each plant inspires them with a kind of mystic love which affects certain of their poems. Their literature represents to us a delight in flowers which we do not easily understand. They are enraptured at the sight of a plant, and seek by continued observation to understand its development. One is not surprised at the degree of skill to which such an exalted taste leads their gardeners.

The emperors have always especially encouraged the production of vegetables and orchards, as well as general agriculture. "I prefer," said the emperor Kang-hi, "to procure a new kind of fruit or of grain for my subjects rather than to build an hundred porcelain towers." Two centuries before him one prince published an herbarium containing the plants suitable to cultivate in time of famine, after having consulted with the peasants and farmers.

The Chinese have always displayed the greatest activity in order to assure themselves of their food at the expense of the vegetable world, sometimes from plants which are not cultivated, as from seaweeds, from which they obtain gelatine or a salty condiment, and particularly from those which they can perfect in their gardens. There are to be found in their kitchen gardens not only the most of our common vegetables, as turnips, carrots, radishes, onions, and our salad herbs, but some

peculiar vegetables like the Chinese cabbage whose seeds furnish oil; the rapeseed, the young shoots of which are used in pickles, like those of mustard; fruits similar to our melons and cucumbers; enormous egg-plants, etc. If the garden contains a stream of water, as is frequent, they cultivate according to the depth of the water either aquatic grasses, of which they eat the terminal buds, or water plants like the lotus, or the Chinese cock's-comb, of which all the parts furnish a nourishing fecula, or plants of the melon family, like the watermelon or the peculiar water chestnut, which is at times a scarlet red, and which they gather in the autumn. The picturesque way in which they gather these nuts is well described by M. Fauvel. Men, women and children embark on the canal in tubs, which they push with long bamboos about the floating islets of the chestnut, and which often capsize, to everyone's great amusement.

In some places one observes a singular culture of mushrooms. These cryptograms are greatly valued in China, and not alone on account of their nutritive properties. One species which takes root upon coming into the open air, and which is edible, has so dry a tissue that it keeps almost as fresh as when one gathers it ripe. Ancient writers took it for a symbol of immortality.

It is particularly interesting to examine the Chinese orchards, distinguishing the productions of the north and south. The fruits of the south are less interesting: dates, cocoanut trees, mangoes, bananas, bread trees, pineapples, all tropical fruits which are not exclusively Chinese. The principal fruits of the north are first *the five fruits*, that is, the peach, apricot, plum, the chestnut and the jujube. The most important of Chinese fruit trees is the peach, which most probably is a native of the country. Its winter florescence has been taken by Chinese romance writers as the symbol of love and fidelity. Chinese orchards also furnish many other fruits: several kinds of plums, a fine white pear as round as our bergamot, the berries of the myrica, which pass very well for our strawberries, and which are easily mistaken for the arbutus berry; but for general use nothing equals the Chinese figs and oranges.

EIGHT CENTURIES WITH WALTER SCOTT.

By WALLACE BRUCE.

"The Fair Maid of Perth" is at once a photograph and a drama. The beautiful county of Perthshire, with its wild mountains and picturesque lakes, seems transferred bodily as by a camera to the novelist's pages, and the historic incidents are so real and rapid in dramatic interest that they seem lifted from the realm of history into a sort of Shakspearean play.

The story opens with a description of Perth from a spot called the Wicks of Baigle, "where the traveler beholds stretching beneath him the valley of the Tay, traversed by its ample and lordly stream; the town of Perth with its two large meadows, its steeples, and its towers; the hills of Moncreiff and Kinnoul faintly rising into picturesque rocks, partly clothed with woods; the rich margin of the river, studded with elegant mansions, and the distant view of the huge Grampian mountains, the northern screen of this exquisite landscape."

The time of the story is 1402. Almost a century has elapsed since the battle of Bannockburn—a century of turmoil and strife. Its history seems like a great tempest-tossed sea swept by constantly recurring whirlwinds. Three kings and as many regents reign in turn; and at the opening of our story Scotland is under the government of Robert the Third.

David the Second, only son of Robert Bruce, died childless; his sister, Marjory, married Walter, the Lord High Steward of the realm; their son was crowned Robert the Third, King of Scotland. The family took the name of Stewart, which gave by direct descent the Stuart line to the throne of Britain, and their descendants are to-day upon the thrones of England,

Italy and Greece. The little skiff, tossed ashore upon the rugged cliffs and cold hospitality of Lorne Castle, as described in our last article, carried therefore the ancestor of a long historic line—a line not always fortunate, not always honest, but presenting for the most part during its record of five hundred years a fair average of manhood and womanhood as kings and queens generally run.

Robert the Third found his country torn by civil feuds, and his temper was too mild for those stormy times. His brother, the Duke of Albany, a crafty counselor of the Iago type, provoked strife between father and son. The good king's heart was broken. "Vengeance followed," says Scott, "though with a slow pace, the treachery and cruelty of his brother. Robert of Albany's own grey hairs went, indeed, in peace to the grave, and he transferred the regency, which he had so foully acquired, to his son Murdoch. But nineteen years after the death of the old king, James the First returned to Scotland, and Duke Murdoch of Albany, with his sons, was brought to the scaffold, in expiation of his father's guilt and his own."

Such are the main historic features of the story. The inwoven incidents make us acquainted with many of the customs of humble life which pertain to the close of the fourteenth and the beginning of the fifteenth century. It portrays the ancient observances of St. Valentine's Day; the fierce conflict of two Highland clans; the bitter jealousy between the Black Douglas and the Earl of March; the trial by Bier-Right in the Church of St. John; the government of Scottish towns and burroughs; the hardihood of the brave burghers who knew their rights, and had the courage to maintain them. It reveals the dissipation of the Court, led on by the much-loved but dissipated son of the king, the Duke of Rothsay, over whom the father mourned, even as David over his son Absalom.

Through this black serge-cloth of history runs a silver thread—the life of Catharine Glover. Her bold and resolute lover, Henry Gow, a smith and armorer by trade, who had the good fortune of being her Valentine, seems too warlike for her gentle and amiable character, or as Harry sums it up briefly in a blunt sentence: "She thinks the whole world is one great minster church, and that all who live in it should behave as if they were at an eternal mass."

The romance abounds with many eloquent passages and poetic touches; even the bold armorer, with his love for hard blows, reveals here and there a touch of sentiment, as where he returns to Perth from a long journey and says: "When I crossed the Wicks and saw the bonny city lie fairly before me, like a fairy queen in romance, whom the knight finds asleep among a wilderness of flowers, I felt even as a bird, when it folds its weary wings to stoop down on its own nest."

The description of the burial of the Highland Chief is the sketch of a master. We are transported to the rugged hills of the northern Highlands. Around us rise lofty mountain peaks; below us stretches the silver expanse of Loch Tay; the black-bannered flotilla carrying the dead leader, Mac Ian, with oars moving to wild music, holds its course to the ruined cathedral of the Holy Isle, where still slumbers the daughter of Henry the First of England, wife of Alexander the First of Scotland. "The monks issue from their lowly portal; the bells peal their death-toll over the long lake; a yell bursts from the assembled multitude, in which the deep shout of warriors, and the shrill wail of females join their notes with the tremulous voice of age, and the babbling cry of childhood; the deer start from their glens for miles around and seek the distant recesses of the mountains, even the domestic animals, accustomed to the voice of man, flee from their pastures into morasses and dingles."

Scott's power as a poet is seen in passages like this, and his power as a dramatist in words like the following placed in the mouth of the heart-broken king, revealing in one condensed sentence of agony the unfortunate state of his country: "Oh, Scotland, Scotland; if the best blood of thy bravest children could enrich the barren soil, what land on earth would excel

thee in fertility? When is it that a white hair is seen on the beard of a Scottish man, unless he be some wretch like thy sovereign, protected from murder by impotence, to witness the scenes of slaughter to which he can not put a period? The demon of strife and slaughter hath possessed the whole land."

But the clouds and mists upon the mountain-heights of royalty do not always envelop the valley, or affect the happiness of those who live in humble spheres; and we are glad to know that Harry Gow is at last made happy by the hand of Catharine. He promises to hand up his broadsword, never more to draw it unless against the enemies of Scotland. "And should Scotland call for it," said Catharine, "I will buckle it round you."

Our next novel, in historic sequence, takes us to the Court of Louis the Eleventh in the year 1468. The reader is introduced to a young Scotchman by the name of Quentin Durward. He is in France seeking employment for his sword; he joins the Scottish archers which form the body-guard of the King; he soon wins the notice and favor of Louis the Eleventh by his courage, address and honesty; he goes as escort for two noble ladies who had fled for refuge from the court of Burgundy to France, and becomes at last as the title of the book would indicate the important personage in the romance, and his honesty is rewarded by the hand of the heroine.

But the great value of this work is the character sketch of Louis the Eleventh, a king who possessed a soul as hardened as that of Mephistopheles, and a brain like that of Machiavelli, whose birth at Florence in 1469 appropriately commemorates the early years of Louis' reign; he found the throne in a tottering condition; in fact all Europe was unsettled. It was the dark hour preceding the dawn of the Reformation. There was some excuse for caution, and perhaps for craftiness in order to preserve his government, but no excuse and no necessity for the cruelty and treachery that marked every day of his life. He seemed malevolent for the sake of malevolence; or as Scott more briefly puts it, "he seemed an incarnation of the devil himself, permitted to do his utmost to corrupt our ideas of honor to its very source." He surrounded himself with menials, invited low and obscure men to secret councils, employed his barber as prime minister, not for any special ability displayed, but from his readiness to pander to his lowest wishes. In every way he brought disrespect upon the court of his father, "who tore from the fangs of the English lion the more than half-conquered kingdom of France."

Scott places the character of Louis the Eleventh in contrast with that of the Duke of Burgundy; "a man who rushed on danger because he loved it, and on difficulties because he despised them." His rude, chivalrous nature despised his wily cousin, who had his mouth at every man's ear, and his hand in every man's palm. As we read the history of Louis XI. he seems like a great spider slowly but surely spinning his web about his enemies until at last there is no escape. By tortuous policy he "rose among the rude sovereigns of the period to the rank of a keeper among wild beasts, who, by superior wisdom, by distribution of food, and some discipline of blows, comes finally to predominate over those, who, if unsubdued by his arts, would by main strength have torn him to pieces."

Apart from the main thread of history Scott gives us a picture of the Gypsies, or Bohemians, who had just made their appearance in Europe. They claimed an Egyptian descent, and their features attested that they were of eastern origin. Their complexion was positively eastern, approaching to that of the Hindoos. Their manners were as depraved as their appearance was poor and beggarly. The few arts which they studied with success, were of a slight and idle, though ingenious description. Their pretensions to read fortunes, by palmistry and astrology, acquired them sometimes respect, but oftener drew them under the suspicion of sorcerers; and lastly, the universal accusation that they augmented their horde by stealing children, subjected them to doubt and execration. They

incurred almost everywhere sentence of banishment, and, where suffered to remain, were rather objects of persecution than of protection from the law. The arrival of the Egyptians as these singular people were called, in various parts of Europe, corresponds with the period in which Tamerlane invaded Hindostan, affording its natives the choice between the Koran and death. There can be little doubt that these wanderers consisted originally of the Hindostanee tribes, who, displaced and flying from the sabers of the Mohammedans, undertook this species of wandering life, without well knowing whither they were going. Scott gives us in the character of Hayraddin a type of this great family, a brief sketch of which taken as above from his notes we thought would be of interest to the general reader.

The interview of Louis the Eleventh with the astrologer not only reveals the superstition of the king but also places in sharp contrast the fifteenth and sixteenth centuries which were cut asunder, as it were, with a sword of light. The old astrologer's apostrophe to the art of printing, which was then invented, is worthy of a place in these historic references: "Believe me that, in considering the consequences of this invention, I read with as certain augury as by any combination of the heavenly bodies, the most awful and portentous changes. When I reflect with what slow and limited supplies the stream of science hath hitherto descended to us; how difficult to be obtained by those most ardent in its search; how certain to be neglected by all who regard their ease; how liable to be diverted, or altogether dried up, by the invasion of barbarism; can I look forward without wonder and astonishment to the lot of a succeeding generation, on which knowledge will descend like the first and second rain, uninterrupted, unabated, unbounded; fertilizing some grounds, and overflowing others; changing the whole form of social life; establishing and overthrowing religions; erecting and destroying kingdoms." "Hold," said Louis, "shall these changes come in our time?" "No, my royal brother," replied the astrologer, "this invention may be likened to a young tree, which is now newly planted, but shall, in succeeding generations, bear fruit as fatal, yet as precious, as that of the Garden of Eden; the knowledge, namely, of good and evil."

Anne of Geierstein is to a certain extent a sequel to Quentin Durward. The time of the story is four years later; the scene is laid in the mountains of Switzerland. The romance reveals the power of the Vehmic tribunal of Westphalia, a secret organization, whose bloody executions gave to the east of Germany the name of the Red Land. It portrays faithfully the heroic character of the Swiss people who preferred peace to war, but accepted war when the issue meant liberty or servitude.

Two travelers, apparently English merchants, are benighted near the ruined castle of Geierstein. They are hospitably entertained, and after a few days' delay, they join a Swiss embassy on its way to the Court of Charles, Duke of Burgundy, the mission of which embassy was to ask redress for injuries done to the Helvetian Cantons. On their journey they meet with a warlike adventure in which the English travelers have opportunity to display their courage and judgment. They are imprisoned and released; the elder has the misfortune of falling into the hands of the Vehmic court, and the rare good fortune of being released; and so the story moves on as it were from one ambuscade to another, until they reach the court and army of the proud Duke of Burgundy.

They meet *en route* at a Cathedral in Strasburg, Queen Margaret of Anjou, who in the bloody struggle between the House of York and Lancaster had been driven from the English throne. This meeting reveals the fact that the English travelers are no less personages than the Earl of Oxford and his son, who are on their way to persuade, if possible, the Duke of Burgundy to give his support to the House of Lancaster. The duke promises relief; but circumstances combine with his

rashness to prevent the proffered aid. He proposes at first to subdue the haughty Swiss. He dismisses their embassy with scorn, and prepares for a fruitless war in spite of the noble plea of the white haired Landamman: "And what can the noble Duke of Burgundy gain by such a strife? Is it wealth and plunder? Alas, my lord, there is more gold and silver on the very bridle-bits of your Highness' household troops than can be found in the public treasures or private hoards of our whole confederacy. Is it fame and glory you aspire to? There is little honor to be won by a numerous army over a few scattered bands, by men clad in mail over half-armed husbandmen and shepherds—of such conquest small was the glory. But if, as all Christian men believe, and as it is the constant trust of my countrymen, from memory of the times of our fathers—if the Lord of Hosts should cast the balance in behalf of the fewer numbers and worse-armed party, I leave it with your Highness to judge, what in that event would be the diminution of worship and fame. Is it extent of vassalage and dominion your Highness desires, by warring with your mountain neighbors? Know that you may, if it be God's will, gain our barren and rugged mountains; but, like our ancestors of old, we will seek refuge in wilder and more distant solitudes, and when we have resisted to the last, we will starve in the icy wastes of the glaciers. Ay, men, women and children, we will be frozen into annihilation together, ere one free Switzer will acknowledge a foreign master."

Well would it have been if the stubborn duke had listened to these words; for Louis the Eleventh was already making peace with the English king, and the balance of power which the duke had held for so many years was slipping from his grasp forever. He attacks the Swiss in their mountain fastnesses, and pays for his rashness with his life. The haughty Queen Margaret dies, and for the time the hope of the House of Lancaster perishes.

But does some fair reader ask: Who is Anne of Geierstein? Is the book all history? Ask the son of the Earl of Oxford, and he will tell you that Anne was the fair maiden who rescued him from a perilous rock the night they were lost near the castle of Geierstein; that she was with the embassy on her way to visit her father; that she again rescued him from imprisonment and death; and after the fall of the House of Lancaster the Swiss maiden becomes his bride.

"And on her lover's arm she leant,
And round her waist she felt it fold,
And so across the hills they went,
In that new world, which is the old."

"But the star of Lancaster," in the language of Scott, "began again to culminate, and called the banished lord and his son from their retirement, to mix once more in politics, and soon thereafter was fought the celebrated battle of Bosworth, in which the arms of Oxford and his son contributed so much to the success of Henry the Seventh. This changed the destinies of young Oxford and his bride; but it is said that the manners and beauty of Anne of Geierstein attracted as much admiration at the English Court as formerly in the Swiss chalet."

ASTRONOMY OF THE HEAVENS FOR JANUARY.

By PROF. M. B. GOFF.

THE SUN,

The source of all our light and heat, although about three millions of miles nearer to us on the 2d of January than it was on the 3d of July last, affords neither the same quantity of light nor heat; and for two reasons: 1. His rays fall on us more obliquely. 2. He does not remain so long above our horizon. On the 1st he rises at 7:24 a. m. and sets at 4:44 p. m., making our day only nine hours and twenty minutes long; and on the 31st rises at 7:11 a. m. and sets at 5:16 p. m., giving us ten

hours and five minutes for a day's length, an increase of forty-five minutes.

THE MOON

Presents the usual phases in order, as follows: First quarter on the 5th, at 4:27 p. m.; full moon on the 12th, at 10:19 a. m.; last quarter on the 20th, at 12:15 a. m.; and new moon on the 27th, at 11:53 p. m., Washington mean time, which is 8 minutes 12.09 seconds slower than "Eastern time," or the time of the 75th meridian west of Greenwich. The moon is nearest the earth at 11:36 a. m. on the 9th; and most distant from the earth at 6:12 a. m. on the 21st. On the 10th she reaches her greatest elevation, which is $67^{\circ} 42'$ above the horizon in latitude $41^{\circ} 30'$ north.

MERCURY

Will be distinctly visible every evening from the first to the thirteenth of the month, setting at 6:06 p. m. on the evening of the former date, and at very nearly the same hour on the latter date. From the 1st to the 11th its motion is from west to east; on the 11th it is said to be stationary; however, it is actually moving in its orbit about thirty thousand miles per hour; but is approaching us in an almost direct line, and thus seems to be at a stand still. On the same day, it arrives at its greatest distance east of the sun, $19^{\circ} 16'$, and then starts on its journey west, approaching the earth, and coming directly between it and the sun, that is, reaching its inferior conjunction about 3:00 on the afternoon of the 20th. On the 31st it will be so far west as to rise one hour and fourteen minutes earlier than the sun.

VENUS

Will be evening star during the month, setting at 6:38 on the evening of the 1st, and at 7:50 p. m. on the 31st. Her motion is direct, amounting, during the month, to 2 hours, 24 minutes, 38 seconds, equal to $36^{\circ} 9\frac{1}{2}'$ of arc, her diameter increasing from 11.6' to 12.8'. This planet will delight the vision of stargazers, not only during January, but several succeeding months.

MARS

Will continue his retrograde motion during the month, moving a little more than one minute per day, making in all 35 minutes 37 seconds. He will be quite a prominent object during the entire night, on the evening of the 1st, rising at 7:50, and on the following morning setting at 9:58; and on the 31st rising at 5:08 p. m., and setting at 7:44 the next morning. His diameter at the latter date will be 15". Can be readily found in the constellation *Leo*, northwest of the bright star *Regulus*. At 1:29 p. m. on the 14th he will be $9^{\circ} 18'$ north of the moon.

JUPITER

Will commence the month as a morning star, rising on the 1st at 6:19 in the evening, and setting next morning at 8:45; but on the 13th will change to an evening star, being on this date in opposition to the sun, and rising as the latter sets at about 5:00 p. m. On the 13th, at 2:53 a. m., he will be $5^{\circ} 41'$ north of the moon. On the 31st he will rise at 4:00 p. m., and next morning will set at 6:34. His diameter at same date will be 43.8". Motion during the month, 16 minutes 12.54 seconds retrograde. The eclipses of this planet's moons, by the body itself, are sometimes used for the purpose of determining longitude. He will be found in the constellation *Cancer*.

SATURN,

"The father of gods and men," rises on the 1st at 2:18 p. m.; sets on the 2d at 4:34 a. m., being over 14 hours above the horizon. On the 31st it rises at 12:12 p. m. and sets next morning at 2:32. Has a retrograde motion of 4 minutes 3.61 seconds. On the 9th at 2:14 a. m. it is only 59' north of the moon. Its diameter is about 18 seconds. Can be found in the constellation *Taurus*, a little northwest of *Aldebaran*, the brightest star of the cluster *Hyades*.

URANUS

Is morning star for the month. On the 1st it rises at 11:08 in the evening; on the 2d at about 10:00 a. m. Although traveling at the rate of over one and one-fourth million miles per hour, it is said to be stationary. As in the case of *Mercury*, it

moves toward us for the time in an almost straight line, and "is not what it seems." It has from the 2d to the end of the month a retrograde motion of 21 minutes 15 seconds of arc. Its diameter is 3.8 seconds. On the 31st it rises at 9:07 in the evening.

NEPTUNE

Will be evening star during the month, rising at 1:35 p. m. on the 1st and at 11:36 a. m. on the 31st, and setting at 3:09 a. m. on the 2d, and at 1:10 a. m. on the 1st of February. On the 8th, at 1:02 a. m., it is 6' south of the moon. On the 28th, at 3:00 p. m., it is stationary. From the 1st to the 28th its motion will be $12\frac{1}{2}$ seconds of arc retrograde, and from the latter date to the end of the month 8.7 seconds of arc direct. Its diameter equals 1.6 seconds. Will be found in the constellation *Aries*. Neptune is so far away that really little is known in regard to it. Its peculiar interest to us centers in the fact developed in its discovery, namely, that notwithstanding comparatively little is definitely settled in astronomical science, a wonderful degree of exactness has been attained in the computation of the places of the heavenly bodies. In 1820, astronomer Bouvard, of Paris, made a new and improved set of tables which formed the basis of the calculations made on the motions of Jupiter, Saturn and Uranus. In a few years it was found by observations that Uranus failed to occupy the place assigned him by the tables. In twenty-four years the disagreement amounted to two minutes of arc (a slight error, one would think, but not to be overlooked, and easily measured). The discrepancy led Mr. John C. Adams, an English student, in 1843, and M. Leverrier, a Frenchman, in 1845, each without the knowledge of the other, to attempt to reckon the elements of an unknown planet that would cause the disturbance. Adams, in October, 1845, communicated the results of his efforts to Prof. Airy, Astronomer Royal, who, however, for some reason not very clear, failed to make any search in the quarter directed. In 1846, the result of Leverrier's calculations were published, and bore such a striking similarity to those of Mr. Adams, that Prof. Challis, of Cambridge Observatory, immediately began a very thorough search, and had made considerable progress, when Leverrier in September, 1846, wrote to Dr. Galle, of Berlin Observatory, giving him the elements, and asking him to direct his telescope to a certain portion of the heavens. This the Doctor did, and the result was that on the 23d of September, 1846, the planet afterward called Neptune, was found within a very short distance from the point indicated by both M. Leverrier and Mr. Adams.

WORK FOR WOMEN.

It is a well established fact that the women of the nineteenth century are workers. They work not only from necessity, but very many from choice. An Eastern journal recently remarked in regard to the general feeling among women that they ought and desired to do something, "It is getting to be good form to support yourself." Girls are supporting themselves very generally, but as yet the majority are in the old and over-filled fields of teaching, sewing, and clerking. There is a constant demand among young women for something new. What work is there for them to learn which will be steady, lucrative, and womanly? And what steps must they take to learn it, and to obtain situations? These questions are daily asked. Many plod in ill-paid, uncongenial places, because they see no other avenues open. To show what work there is, and how learned and secured, Messrs. G. P. Putnam's Sons have recently published, in their "Handy-Volume Series," a little volume on "Work for Women." The book is decidedly practical. As the author in his preface claims, it answers accurately the questions: "Is there a good chance to get work? How long will it take me to make myself competent? Are there many in the business? How much do they earn? Are there any objections against entering this employment; if so, what are they?"

Exactly the questions which should be asked and satisfactorily answered before entering any work. Among the employments of which the author, Mr. G. P. Manson, speaks, industrial drawing properly holds the foremost place. For women of real taste and originality it is peculiarly suitable; but they must have both qualities. Without either a woman should never run the risk of entering the field; unless, indeed, she can afford to make the experiment. To one familiar with dry goods and house-furnishing, who knows the almost infinite varieties in the patterns of carpets, wall-papers, oil-cloths, calicoes, and the like, there can be no question about the chances for employment for skilled laborers. The work pays, too, and is pleasant. Still more important, there is little danger of one being lowered by it to a mere machine. It is work in which one grows.

Some wise words, worth remembering, are said in regard to phonography. A valuable idea to the learner is that the practical teacher, that is, the *bona fide* reporter, is worth more than many lessons from one who has learned the art simply to teach it, but has never practiced; and that the constant practice of what one may learn from any one of the books on the subject will be of more service than an extended course in a short-hand school. Most excellent is the advice given to ladies studying phonography that they should add book-keeping and type-writing. With these acquirements a woman can not fail in finding employment.

The art of telegraphy is to be learned in about the same way as phonography—by practice and patience. There are about forty schools in the United States where it is taught. Of these the New York Cooper Union School of Telegraphy is undoubtedly foremost; but before selecting a school it is wise to get the experience of a skilled operator—a most excellent plan to follow, by the way, in any field. Women rarely advance in this business beyond a certain rank, and unless luck favors them with a situation in the private office of a generous employer, they rarely reach positions which pay more than sixty dollars per month.

It is astonishing that work which at first thought seems to require so little skill as feather-curling, should average to expert laborers fifteen to twenty dollars per week, through the entire year, and sometimes reach as high as forty dollars per week. But this is the fact, and the work, too, is less confining than sewing. There is a serious drawback, however—the girls and women are not always moral, and the association is thus dangerous. None of the professions of which Mr. Manson speaks are more suitable for women than that of nursing. The feeling that it is a menial service is entirely wrong. There is no position which a woman can hold which requires more character, skill, self-control and wisdom. Mr. Manson, in his chapter on nursing, gives exactly the information which is needed for a woman about to enter the profession. Indeed, this is true of all that he says on the different branches of work which he takes up, among which are photography, proof-reading, type-setting, book-binding, lecturing, public reading, book selling, dress-making and millinery.

There are several varieties of work on which he has made but brief notes, to which we wish he would give further attention. These are employments at which women may earn their living, and yet be at home. There are many women left with families and little homes who struggle to live by sewing, washing, and the like, because they do not know what else to do. There are several employments suitable to them, and in which women almost invariably succeed; such are bee keeping, poultry raising, market gardening and cultivating flowers. A little capital is necessary, but a very little will start a business which, if well managed, can hardly fail to become prosperous. There are two great considerations in favor of such work: it is healthy, and allows one to remain at home. The considerations which should govern a woman in selecting any one of the employments mentioned in this little volume are satisfactorily discussed, and any one desiring information upon the vexed question, "What shall I do?" will receive valuable suggestions.

OSTRICH HUNTING.

By LADY FLORENCE DIXIE.

The following animated description of ostrich hunting in Patagonia is taken from a book by Lady Florence Dixie, published by R. Worthington, New York:

As we rode silently along, with our eyes well about us, in the hopes of sighting an ostrich, my horse suddenly shied at something white lying on the ground at a few paces distant. Throwing the reins over his head, I dismounted and walked toward the spot. Amongst some long grass I discovered a deserted nest of an ostrich containing ten or eleven eggs, and calling François to examine them, was greatly chagrined to find that none of them were fresh. With the superstition of an ostrich-hunter François picked up a feather lying close at hand, and sticking it in his cap, assured us that this was a good sign, and that it would not be long before we came across one of these birds.

His prediction was speedily verified, for on reaching the summit of a little hill, up which we had slowly and stealthily proceeded, two small gray objects suddenly struck my eye. I signed to François and my brother, who were riding some twenty yards behind me, and putting spurs to my horse, galloped down the hill toward the two gray objects I had perceived in the distance. "Choo! choo!" shouted François, a cry by which the ostrich-hunters cheer their dogs on, and intimate to them the proximity of game. Past me like lightning the four eager animals rushed, bent on securing the prey which their quick sight had already detected.

The ostriches turned one look on their pursuers, and the next moment they wheeled round, and making for the plain, scudded over the ground at a tremendous pace.

And now, for the first time, I began to experience all the glorious excitement of an ostrich-hunt. My little horse, keen as his rider, took the bit between his teeth, and away we went up and down the hills at a terrific pace. On and on flew the ostriches, closer and closer crept up "Leona," a small, red, half-bred Scotch deerhound, with "Loca," a wiry black lurcher at her heels, who in turn was closely followed by "Apiscuña" and "Sultan." In another moment the little red dog would be alongside the ostriches. Suddenly, however, they twisted right and left respectively, scudding away in opposite directions over the plain, a feint which of course gave them a great advantage, as the dogs in their eagerness shot forward a long way before they were able to stop themselves. By the time they had done so the ostriches had got such a start that, seeing pursuit was useless, we called the dogs back. We were very much disappointed at our failure, and in no very pleasant frame of mind turned our horses' heads in the direction of our camp.

We were a good deal chaffed when we got home on the score of our non-success, and over pipes and coffee that night a serious council of war was held by the whole of our party, as regards ostrich-hunting for the morrow.

Forming a circle was suggested. This being the method by which the Indians nearly always obtain game. It is formed by lighting fires round a large area of ground into which the different hunters ride from all sides. A complete circle of blazing fires is thus obtained, and any game found therein is pretty sure to become the prey of the dogs, as no ostrich or guanaco will face a fire. Wherever they turn they see before them a column of smoke, or are met by dogs and horsemen. Escape becomes almost impossible, and it is not long before they grow bewildered and are captured.

Next morning, the horses being all ready, we lost no time in springing into the saddle. For about half an hour we followed along a line of broken hillocks, after which, calling a halt, we sent forward Guillaume and I'Aria to commence the first and most distant proceedings of the circle. They departed at a brisk canter, and it was not long before several rising col-

umns of smoke testified that they were already busily engaged.

For some time Gregorio and I rode slowly and silently on our way, when a sudden unexpected bound which my horse gave all but unseated me. "Avestruz! Avestruz!" shouted Gregorio, and turned his horse with a quick movement. "Choo! choo! Plata!" I cry to the dog who followed at my horse's heels, as a fine male ostrich scudded away toward the hills we had just left with the speed of lightning. Plata has sighted him, and is straining every limb to reach the terrified bird. He is a plucky dog and a fleet one, but it will take him all his time to come alongside that great raking ostrich as he strides away in all the conscious pride of his strength and speed. "We shall lose him!" I cry, half mad with excitement, spurring my horse, who is beginning to gasp and falter as the hill up which we are struggling grows steeper and steeper. But the ostrich suddenly doubles to the left, and commences a hurried descent. The cause is soon explained, for in the direction toward which he has been making a great cloud of smoke rises menacingly in his path, and, balked of the refuge he had hoped to find amidst the hills, the great bird is forced to alter his course, and make swiftly for the plains below. But swiftly as he flies along, so does Plata, who finds a down-hill race much more suited to his splendid shoulders and rare stride. Foot by foot he lessens the distance that separates him from his prey, and gets nearer and nearer to the fast sinking, fast tiring bird. Away we go, helter-skelter down the hill, unchecked and undefeated by the numerous obstacles that obstruct the way. Plata is alongside the ostrich, and gathers himself for a spring at the bird's throat. "He has him, he has him!" I shout to Gregorio, who does not reply, but urges his horse on with whip and spur. "Has he got him, though?" Yes—no—the ostrich with a rapid twist has shot some thirty yards ahead of his enemy, and whirling round, makes for the hills once more. And now begins the struggle for victory. The ostrich has decidedly the best of it, for Plata, though he struggles gamely, does not like the uphill work, and at every stride loses ground. There is another fire on the hill above, but it lies too much to the left to attract the bird's attention, who has evidently a safe line of escape in view in that direction. On, on we press; on, on flies the ostrich; bravely and gamely struggles in its wake poor Plata. "Can he stay?" I cry to Gregorio, who smiles and nods his head. He is right, the dog can stay, for hardly have the words left my lips when, with a tremendous effort, he puts on a spurt, and races up alongside the ostrich. Once more the bird points for the plain; he is beginning to falter, but he is great and strong, and is not beaten yet. It will take all Plata's time and cunning to pull that magnificent bird to the ground, and it will be a long fierce struggle ere the gallant creature yields up his life. Unconscious of anything but the exciting chase before me, I am suddenly disagreeably reminded that there is such a thing as caution, and necessity to look where you are going to, for, putting his foot in an unusually deep tuca-tuca hole, my little horse comes with a crash upon his head, and turns completely over on his back, burying me beneath him in a hopeless muddle. Fortunately, beyond a shaking, I am unhurt, and remounting, endeavor to rejoin the now somewhat distant chase. The ostrich, Gregorio, and the dog have reached the plain, and as I gallop quickly down the hill I can see that the bird has begun doubling. This is a sure sign of fatigue, and shows that the ostrich's strength is beginning to fail him. Nevertheless it is a matter of no small difficulty for one dog to secure his prey, even at this juncture, as he can not turn and twist about as rapidly as the ostrich. At each double the bird shoots far ahead of his pursuer, and gains a considerable advantage. Away across the plain the two animals fly, whilst I and Gregorio press eagerly in their wake. The excitement grows every moment more intense, and I watch the close struggle going on with the keenest interest. Suddenly the stride of the bird grows slower, his doubles become more frequent, showers of feathers fly in every direction as Plata seizes

him by the tail, which comes away in his mouth. In another moment the dog has him by the throat, and for a few minutes nothing can be distinguished but a gray struggling heap. Then Gregorio dashes forward and throws himself off his horse, breaks the bird's neck, and when I arrive upon the scene the struggle is over. The run had lasted for twenty-five minutes.

Our dogs and horses were in a most pitiable state. Poor Plata lay stretched on the ground with his tongue, hot and fiery, lolling out of his mouth, and his sides going at a hundred miles an hour. The horses, with their heads drooped till they almost touched the ground, and their bodies streaming with perspiration, presented a most pitiable sight, and while Gregorio disemboweled and fastened the ostrich together, I loosened their girths, and led them to a pool hard by to drink. At length they became more comfortable, and as soon as they seemed in a fit state to go on, Gregorio and I lifted the huge bird on to his horse, and tied it across the animal's withers. Encumbered thus, Gregorio turned to depart in the direction of the camp, followed by Plata, while I went in an opposite direction in search of my companions down in the plain. It was not long before I distinguished in the far distance an ostrich coming straight toward me, closely followed by a dog and two horsemen. Galloping to meet them, I was the means of turning the bird into "Peaché's" jaws, for such was the name of I'Aria's dog. The two horsemen turned out to be the old fellow in question and my brother, who arrived, hot and full of excitement, on the scene just as I was throwing myself from my horse to prevent Peaché from tearing the bird to pieces. Leaving I'Aria to complete the hunter's work, my brother and I rode slowly back toward our camp, discussing the merits of our horses, dogs, and the stamina of the two ostriches we had slain.

One by one the other hunters dropped in. They had all been successful, with the exception of Guillaume; and as we stood grouped round the five large ostriches lying on the ground, we congratulated ourselves on our good fortune, and on the excellent sport we had had. At dinner we passed judgment on ostrich-meat, which we now really tasted for the first time, for what we had obtained from the Indian camp had been dry and unpalatable. We thought it excellent; the breast and wings are particularly good; the latter much resemble pheasant.

CHRISTIAN MISSIONS.

The most recent intelligence at hand from the Missionary Boards of the different denominations is so full of general interest and encouragement that we give the results that have been reached. With the tens of thousands of our thoughtful readers, we rejoice greatly in this work so efficiently carried on by the American churches at home and abroad.

The latter part of the nineteenth century is becoming more and more a missionary era. Practical heed is given to the "Great Commission," and the heralds are sent forth into all the world, with the tidings of "peace on earth, and good-will to men."

METHODIST EPISCOPAL BOARD.

This Church, the youngest of the large denominations, and last to enter the foreign field, has done some effective service. A few weeks since some fears were entertained that from a single point where success was not satisfactory, the partially defeated forces might be, for a time, withdrawn. Such fears were groundless, and the orders are for an advance all along the lines. The little company in Bulgaria have struggled under many disadvantages, but will be reinforced, and the work go on.

At the late meeting of the General Committee, in New York, the annual appropriations were advanced to \$750,000, in the confidence that the church will meet the demand.

The Home Missions of this church are numerous. There are reported 2,381 missionaries in the home fields, and more

could be profitably employed in communities unable of themselves to furnish an adequate support. The aggregate of the border missions shows an increase in membership, and of church property. The missionary aid given to feeble churches and to establish churches where none existed, combined with the efforts of other organizations, is doing a work whose value can hardly be over-estimated.

The Foreign Missions of the Methodist Episcopal Church are in fifteen nations. A larger number of missionaries are in India than in any other country.

The summarized statistics show:

Foreign missionaries and wives	225
Native ordained preachers	246
Native preachers not ordained	187
Native local preachers	317
Native workers in Woman's For. Mis. Society . .	291
Foreign teachers	34
Native teachers	521
Members	29,095
Probationers	9,984

The school system, both for secular and theological education is well organized, and doing a good work. Churches and conferences are organized as in this country.

PRESBYTERIAN BOARD.

In the Home Missions the Board employs 1,387 missionaries and 133 missionary teachers. 6,281 were, during the year, added to the mission churches on profession of faith. The total membership of those assisted is 73,669. There was raised for building, repairing and canceling debts on church property \$726,517. The above mission churches are sustained wholly, or in part, by the funds of the Board. Thirty-seven of the number became self-sustaining during the year. The receipts of the Board for the year were \$524,795.61, being an advance of \$81,406.76 over the previous year. We do not wonder that these servants of Christ thank Him, and express their feelings of gratitude to the contributing churches, for their prayers, sympathy and "unprecedented pecuniary aid." The Presbyterian Board of Foreign Missions has work in the following fields: Among the North American Indians, Mexico—the Southern and Northern fields; South America—Brazil, Chili; Africa, Asia, Persia, India, Siam—among the Laos; China, Japan, Chinese in America, Guatemala, Papal Europe, Geneva, France, Belgium, Bohemia and Waldensea.

The Board has in its employ 159 American missionaries, 225 native helpers, 92 of whom are ordained, and 133 licentiate; 286 lay American missionaries, 585 native lay helpers, 18,656 communicants, 21,253 pupils in day and boarding schools.

In their work among the American Indians they have 10 missionaries and 25 native ministers and licentiate.

The receipts for the past year were \$656,237.99; also an advance on the previous year.

These missionary boards, so well sustained by the churches of their denominations, seem to have been both wise in counsels and aggressive in their measures, and their success has been glorious.

THE AMERICAN BOARD.

This is the oldest and among the most efficient and successful of all American missionary societies. Organized in 1812, and for a time aided by persons of all the evangelical churches who had the missionary spirit, and whose benevolence thus found a safe and suitable channel, through which its streams could reach the heathen, the Board, with prudent management and liberal support, has had a most successful career. They are now the organ of the Congregationalist church, and have established their posts or centers for extensive operations in all quarters of the globe. The year past is spoken of with thanksgiving, as one of the most satisfactory, and in some departments of the work, as of remarkable progress. After a full and luminous statement of the work of the year, the annual

report closes, saying: "It is quite impossible by such a rapid glance to give any just conception of a work so wide in extent, so varied in character. We may speak of twenty missions and one hundred and forty-six missionaries at eighty different stations, and of 724 other towns, and cities, and islands in which the gospel is preached; we may call attention to 98 high schools and seminaries, in which 3,624 youth of both sexes are enjoying the advantages of higher Christian education; we may mention, one by one, the 278 churches gathered, the 1,737 members added the present year to our roll of membership, till the whole number received on profession of faith from the first till now, including missions closed and transferred, amounts to nearly 90,000; and yet, how can we tell of the moral and spiritual changes wrought in entire communities by the Word and spirit of our God, by the new thought and sentiment vivifying the languages and the literatures, and one day to mould the life and character of tribes and nations constituting one-third of the human race." The Board, after showing that, with the present need and present opportunity, \$2,000,000 could be economically administered in prosecuting their missionary work, reduce the amount to \$1,000,000; and, with modest urgency, ask the churches to regard that as the minimum estimate for 1884. The home work of the Congregationalists is also well organized and prosecuted with vigor.

BAPTIST MISSIONARY UNION.

This has been long known as a vigorous and aggressive association, doing most effective work in both the home and foreign fields. The expenditures during the past year were \$316,411.94. Of the above amount the Woman's Baptist Foreign Missionary Society contributed \$42,977.51; the Woman's Missionary Society of the West, \$20,706.88; the Woman's Society of the Pacific Coast, \$665.23; the Woman's Society of the North Pacific Coast, \$445.31, making an aggregate of \$64,794.93 contributed by the Christian women of the denomination. All departments of their work are reported in a prosperous condition, but we have not the general statistics of the society at hand.

Sir Bartle Frere has observed that he had rarely seen or heard of a missionary institution in South Africa which did not by its measure of success fully justify the means employed to carry it on; and that the worst managed and least efficient missionary institutions he had seen appeared to him far superior as civilizing agencies to anything which could be devised by the unassisted secular power of the government.

CALIFORNIA.

By FRANCES E. WILLARD, President National W. C. T. U.

NO. II.—SAN FRANCISCO SILHOUETTES.

This city is the whispering gallery of all nations. In Constantinople the clamor of tongues is bewildering, while here it is more harmonious, more representative. Here you have a polyglot at the Golden Gate, a universal language. In the east there is no fusion; in the west one better understands Tennyson's vision of all earth's banners furled

"In the parliament of man, the federation of the world."

Of all places on the globe, go to the California metropolis if you would feel the strong pulse of internationalism. Few have caught its rhythm, as yet, but we must do so if we would be strong enough to keep step with that matchless, electric twentieth century soon to go swinging past. You can almost hear his resonant step on San Francisco pavements; his voice whispers in the lengthening telephone, saying, "Yesterday was good, to-day is better, but to-morrow shall be the red-letter day of all life's magic calendar." I have always been impatient of our planet's name—"the earth." What other, among the shining orbs has a designation so insignificant? That we have put up with it so long is a proof of the awful inertia of the aggregate

mind, almost as surprising as our endurance of the traffic in alcoholic poison. With Jupiter and Venus, Orion and the Pleiades smiling down upon us in their patronizing fashion, we have been contented to inscribe on our visiting cards: "At Home: *The Earth!*" Out upon such paucity of language. "The dust o' the ground" forsooth! That answered well enough perhaps for a dark-minded people who never even dreamed they were living on a star. Even now an army of good folks afraid of the next thing, just because it is the next, and not the last, will doubtless raise holy hands of horror against the proposition I shall proceed to launch forth for the first time, though it is harmless as the Pope's bull against the comet. They will probably oppose me, too, on theologic grounds, for, as Coleridge hath it,

"Time consecrates, and what is gray with age becomes religion."

Nevertheless, since we do inhabit a star, I solemnly propose we cease to call it a dirt heap, and being determined to "live up to my light," I hereby bring forward and clap a patent upon the name

CONCORDIA.

"I move it as a substitute for the original motion," and call the previous question on "the Parliament of Man"—aforesaid by the English Laureate. By the same token, I met half a dozen selectest growths of people in San Francisco who, in the broadest, international way are doing more to make this name Concordia descriptive, rather than prophetic in its application to our oldest home, than any other people I can name. They work among the Chinese, Japanese, and "wild Arabs of the Barbary Coast," they go with faces that are an epitomized gospel, and preach to the stranger within the Golden Gate that he is a stranger no more; they bring glad tidings of good which shall be to all people, for to them, as to their Master, "there is neither Jew nor Greek, bond nor free, male nor female in Christ Jesus."

Look at this unique group photographed upon the sensitive plate of memory by "your special artist." A tall Kentuckian of the best type; "much every way;" "big heart, big head, fine, clear-cut countenance, blue, scrutinizing eyes, large form, wrapped in an ample overcoat, its pockets full of scientific temperance documents," this is Dr. R. H. McDonald, President of the Pacific Bank, Prohibition candidate for Governor, and temperance leader "on the coast." Go with me to his elegant home; see his mother, fair and beaming at eighty-four; and his talented sons, who, though educated largely abroad, have never tarnished their fine physiques with the alcoholic or nicotine poisons. Go to the "Star Band of Hope Hall" on Sunday afternoon and hear his accomplished daughter sing to the little street Arabs of the society, while the Doctor presides over the meeting and introduces the eastern temperance worker, your correspondent and her secretary, Miss Anna Gordon, after whose speeches he presents each dear little child to us, patting them on the head, whispering words of praise for each, and emptying his great pockets of goodies and children's literature. Remember that he has heart and hand open for every good work; know that he has a fortune of seven millions, and pray heaven to send us more wealthy men with wealthy hearts. Beside him stands a small, plain looking man with a royal gray eye; a man of quiet manners, terse, vigorous style, and cultured English utterances, a former sea-captain, who in the ports of China and Japan, as well as Boston and Liverpool, has succeeded in keeping his crew sober, and in teaching them to lay up their money; a gifted head and loyal heart he has; witness his editorials in *The Rescue* and his leadership in founding the great Orphan's Home at Vallejo in the suburbs (both paper and orphanage being conducted by the Good Templars, whose most gifted members are Will D. Gould, the genial lawyer of Los Angeles, Mrs. Emily Pitt Stevens, the best temperance lecturers on the coast, Mrs. M. E. Corigdon, of Mariposa, and Geo. B. Katzenstein, of Sacramento). Very different in method, though

one in aim with the two men I have described, is another redoubtable champion of every good cause, Rev. Dr. M. C. Briggs, who is like a tower "that stands four-square to every wind that blows." Observe that well-knit figure, those herculean shoulders, that dauntless face, and it will go without saying that this man is nature's model of the Methodist pioneer, to whom all hardships are but play; who has a sledge hammer blow for evil doers, but a brother's clasp for the repentant; a man whose deep, musical voice in the palmy days of his prime gave wings to such rhetoric and such argument as combined with the speeches of Starr King and Col. Baker, to save California to the Union. Near the gifted Dr. Briggs stand his lifetime friends and allies, Captain and Mrs. Charles Goodall, the former our Methodist Mæcænus in California, founder of the famous "Oregon Navigation Company," and the true type of a Christian layman, his heart and home open to all who come in the name of the Master whom he loves with the simplicity and fondness of the child. A tall, dark-eyed, impressive man, in life's full prime, comes next. "See Otis Gibson, or you have missed the moral hero of Goldopolis"—this was concurrent testimony coming from every side. Garfield left no truer saying than that the time wants men "who have the courage to look the devil squarely in the face and tell him that he is the devil." Precisely this fearless sort of character is Rev. Otis Gibson. He has been the uncompromising friend of "the heathen Chinese," through all that pitiful Celestial's grievous fortunes on our western shore. When others cursed he blessed; while others pondered he prayed; what was lacking in schools, church, counsel and kindness he supplied. It cost something thus to stand by a hated and traduced race in spite of hoodlum and Pharisee combined. But Otis Gibson could not see why the people to whom we owe the compass and the art of printing, the choicest porcelain, the civil service examination might not christianize as readily on our shores as their own. In this faith he and his noble wife have worked on until they have built up a veritable city of refuge for the defenceless and despairing, in the young and half barbarous metropolis of the Pacific slope. We went to a wedding in this attractive home, where a well-to-do young Chinaman was married to a modest, gentle Chinese girl, rescued from a life of untold misery and sin by this blessed Christian home. Contrary to popular opinion, a chorus of Chinese made very tolerable music, and while a Celestial played one of Sankey's hymns, stately Mrs. Capt. Goodall, the generous friend and patron saint of the establishment, escorted the bride, and after a simple service (with the word "obey" conspicuously left out), the large circle of invited philanthropists was regaled on the refreshments made and provided for such entertainments.

We afterward visited the "Chinese Quarter," so often described, under escort of Rev. Dr. Gibson. We saw the theaters where men sit on the back and put their feet on the board part of the seat; where actors don their costumes in full sight of the audience, and frightful pictured dragons compete with worse discord for supremacy. We saw the joss-house, with swinging censer and burning incense, tapers and tawdriness, a travesty of the Catholic ceremonial, taking from the latter its one poor merit of originality. We saw a mother and child kneeling before a hideous idol, burning tapers, tossing dice, and thus "consulting the oracle," with many a sidelong glance of inattention on the part of the six-year-old boy, but with sighs and groans that proved how tragically earnest was the mother's faith. Dr. Gibson said the numbers on the dice corresponded to wise sayings and advices on strips of paper sold by a mysterious Chinese whose "pious shop" was in the temple vestibule, whither the poor woman resorted to learn the result of her "throw," and then returned to try again, until she got some response that quieted her. Could human incredulity and ignorance go farther? We saw the restaurants, markets and bazars, as thoroughly Chinese as Pekin itself can furnish; the haunts of vice, all open to the day; the opium dens, with their comatose victims; and

then, to comfort our hearts and take away the painful vividness of woman's degradation, Dr. Gibson took us to see a Christian Chinese home, made by two of his pupils, for years trained under his eye. How can I make the contrast plain enough? A square or two away, the horrid orgies of opium and other dens, but here a well-kept dry goods store, where the husband was proprietor, and in the rear a quiet, pleasant, sacred home. The cleanly, kind-faced wife busy with household cares, her rooms the picture of neatness, her pretty baby sleeping in his crib, and over all the peace that comes from praise and prayer. Never in my life did I approach so near to that perception, too great for mortal to attain, of what the gospel has achieved for woman, as when this gentle, honored wife and mother said, seeing me point to an engraving of "The Good Shepherd," on her nursery wall: "*O, yes! he gave this home to us.*"

Otis Gibson conducts the Methodist Mission of San Francisco. In that of the Presbyterian, Mrs. P. B. Browne, a gifted lady, president of the W. C. T. U. of California, is prominent, as she has long been in the Woman's Christian Association. Mrs. Taylor, president of the local W. C. T. U., is a lovely Christian worker, also Mrs. Williams of the same society, and Miss Annie Crary, daughter of that rare editorial genius, Rev. Dr. B. F. Crary of *The California Christian Advocate*, is our most talented and best taught Kindergartner.

But there remains a choice bit of portraiture ere my group of philanthropic leaders is complete. How firm and fine the etching that should accurately show the features of Mrs. Sarah B. Cooper, whose strong, sweet individuality I have not seen excelled—no, not even among women. From the time when our eastern press teemed with notices of the Presbyterian lady who had been tried for heresy and acquitted, who had the largest Bible class in San Francisco and was founder of that city's Kindergartens for the poor, I made a mental memorandum that, no matter whom I missed, this lady I would see. So at 12:30 on a mild May Sabbath noon, I sought the elegant Plymouth Church, built by Rev. Dr. A. L. Stone, and found a veritable congregation in its noble auditorium. Men and women of high character and rare thoughtfulness were gathered, Bibles in hand, to hear the exposition of the acquitted heretic, whom a Pharisaical deacon had begun to assail contemporaneously with her outstripping him in popularity as an expounder of the gospel of love. She entered quietly by a side door, seated herself at a table level with the pews, laid aside her fur-lined cloak and revealed a fragile but symmetric figure, somewhat above the medium height, simply attired in black, with pose and movement altogether graceful, and while perfectly self-possessed, at the furthest remove from being self-assertive. Then I noted a sweet, untroubled brow, soft brown hair chastened with tinge of silver (frost that fell before its time, doubtless at the doughty deacon's bidding); blue eyes, large, bright and loving; nose of the noblest Roman, dominant yet sensitive, chiseled by generations of culture, the unmistakable expression of highest force and mettlesomeness in character, held in check by all the gentlest sentiments: a mouth firm, yet delicate, full of the smiles that follow tears. Wordsworth's lines describe her best:

* * "A creature not too bright or good
For human nature's daily food,
And yet a spirit, still and bright,
With something of an angel's light."

The teacher's method was not that of pumping in, but drawing out. There were no extended monologues, but the Socratic style of colloquy—brief, comprehensive, passing rapidly from point to point, characterized the most suggestive and helpful hour I ever spent in Bible class. There was not the faintest effort at rhetorical effect; not a suspicion of the hortatory in manner, but all was so fresh, simple and earnest, that in contrast to the pabulum too often served up on similar occasions, this was nutritious essence. A Bible class teacher is like a hen

with ample brood and all inclined to "take to the grass." How to coax them back from their discursive rambles by discovering the toothsome morsel and restfully proclaiming it, the average teacher "finds not," but it is a portion of "the vision and faculty divine" in this California phenomenon. Let me jot down a few notes :

"What we call the new birth is but the opening of the eyes of the spirit upon its own world." "There can be no kingdom of love to us, unless we enter it by love. We can not be mathematicians unless we enter the kingdom of mathematics. We can not perceive anything unless we address to it the appropriate organ of perception." "Have we risen into any experience of the higher life? Are we in the way of completeness of soul? A soul dark toward God is in sad plight. No meaning in worship—none in prayer—that is a soul diseased." "Baptism makes a child of God as coronation makes a king. But remember, he was a king before he was crowned." As Lucretia Mott said, "We must have truth for authority, and not authority for truth." "Dorcas did not bestow alms-gifts but alms-deeds; wrought not by a Dorcas society, but by Dorcas herself." "Christ's miracles were subject to the laws of the spiritual world. He could not spiritually bless those who were not susceptible to spiritual blessing." "If I would prove to any one that God is his father I must first prove to him that I am his brother."

When the delightful hour was over, among the loving group that gathered around her, attracted by the healing virtue of her spiritual atmosphere, came a temperance sojourner from the east. As my name was mentioned, the face so full of spirituality lighted even more than was its wont, and the soft, strong voice said, "Sometimes an introduction is a *recognition*—and so I feel it to be now." Dear reader, I consider that enough of a compliment to last me for a term of years. I feel that it helped mortgage me to a pure life; I shall be better for it "right along." For if I have ever clasped hands with a truth-seeker, a disciple of Christ and lover of humanity, Sarah B. Cooper held out to me that loving, loyal hand. The only "invitation out" which I gave to myself, and insisted on keeping, was to this woman's home on Vallejo avenue, where, with her noble husband and true-hearted daughter, she illustrates how near the gates of Paradise a mortal home may be. One's ideal seldom "materializes," but in that lovely cottage, with its spotless cleanliness, fair, tasteful rooms, individualized so perfectly that he who ran might read how high the natures mirrored here, in the flower-decked dinner table and the "good talk," in the study upstairs packed with choice books, and the sunset window looking out over the Golden Gate, I stored up memories that ought to yield electric energy for many a day. We talked of the past—and I found that my new friend, as well as her husband, had been for years the pupil of my beloved father in the gospel, our lamented Dr. Henry Bannister, late Professor of Hebrew in Garrett Biblical Institute at Evanston, Ill. With what reverence and tenderness we talked of that brave, earnest, sympathetic life! We spoke of her experiences as a teacher in the South, and she rejoiced in the good tidings I brought of a "Yankee school-ma'am's" welcome for temperance's sake in nearly one hundred cities of Dixie's land. We talked most of all about God and his unspeakable gift of Christ Jesus our Lord. I found this tireless brain had busied itself with the study of all religions, the testimony of science, philosophy and art; a more hospitable intellect I have not known, nor a glance more wide and tolerant, but "Christ and him crucified" is to that loyal heart "the Chief among thousands and altogether lovely."

Let me give a few sentences from the inspiring letters that come to me across the distance between that bay window by the Golden Gate, and my "Rest Cottage" by the inland sea:

"If I know myself, I have one regnant wish: To help build up the coming kingdom." "I desire you to include me in all your invocations for light and guidance." "We move on in one work, we are co-laborers for a common Master—blessed be His

name. We both aim at one thing: character-building in Christ Jesus. I am to speak before the C. L. S. C. at Pacific Grove, Monterey, on the 'Kindergarten in its Relation to Character-Building.' I shall speak of temperance. Have tried to help women both north and south who are working in their little towns heroically." "The Chautauqua of the Coast, energized by desperate, sometimes almost despairing love for their tempted ones."

The *Independent* and other leading journals have in Mrs. Cooper a valued correspondent, and her work among the little, ill-born and worse-nurtured children of San Francisco's moral Sahara has been described by her own pure and radiant pen. It is one of the most potent forces in that city's uplift toward Christianity. Among the best types of representative women, America may justly count Sarah B. Cooper, the student, the Christian exegete and philosopher, and the tender friend of every untaught little child.

TABLE-TALK OF NAPOLEON BONAPARTE.

When Napoleon was about fourteen, he was conversing with a lady about Marshal Turenne, and extolling him to the skies. "Yes, my friend," she answered, "he was a great man; but I should like him better if he had not burnt the Palatinate."

"What does that matter," he replied briskly, "if the burning was necessary to the success of his plans?"

Napoleon's German master, a heavy and phlegmatic man, who thought the study of German the only one necessary to a man's success in life, finding Napoleon absent from his class one day, asked where he was. He was told he was undergoing his examination for the artillery.

"Does he know anything then?" he asked ironically.

"Why, sir, he is the best mathematician in the school."

"Well," was his sage remark, "I have always heard say, and I always thought, that mathematics was a study only suitable to fools."

"It would be satisfactory to know," Napoleon said twenty years after, "if my professor lived long enough to enjoy his discernment."

In 1782, at one of the holiday school fêtes at Brienne, to which all the inhabitants of the place were invited, guards were established to preserve order. The dignities of officer and subaltern were conferred only on the most distinguished. Bonaparte was one of these on a certain occasion, when "The Death of Cæsar" was to be performed.

A janitor's wife who was perfectly well known presented herself for admission without a ticket. She made a clamor, and insisted upon being let in, and the sergeant reported her to Napoleon, who, in an imperative tone, exclaimed, "Let that woman be removed, who brings into this place the license of a camp."

Bonaparte was confirmed at the military school at Paris. At the name of Napoleon, the archbishop who confirmed him expressed his astonishment, saying that he did not know this saint, that he was not in the calendar, etc. The child answered unhesitatingly, "That that was no reason, for there were a crowd of saints in Paradise, and only 365 days in the year."

Dining one day with one of the professors at Brienne, the professor knowing his young pupil's admiration for Paoli, spoke disrespectfully of the general to tease the boy.

Napoleon was energetic in his defense. "Paoli, sir," said he, "was a great man! he loved his country; and I shall never forgive my father for consenting to the union of Corsica with France."

One evening in the midst of the Reign of Terror, on returning from a walk through the streets of Paris, a lady asked him:

"How do you like the new Constitution?"

He replied hesitatingly: "Why, it is good in one sense, certainly; but all that is connected with carnage is bad;" and then he exclaimed in an outburst of undisguised feeling: "No! no! no! down with this constitution; I do not like it."

1794. During the siege of Toulon, one of the agents of the convention ventured to criticise the position of a gun which Napoleon was superintending. "Do you," he tartly replied, "attend to your duty as national commissioners, and I will be answerable for mine with my head."

An officer, entering Napoleon's room, found, much to his astonishment, Napoleon dressed and studying.

"What!" exclaimed his friend, "are you not in bed yet?"

"In bed!" replied Napoleon, "I have finished my sleep and already risen."

"What, so early?" the other replied.

"Yes," continued Napoleon, "so early. Two or three hours of sleep are enough for any man."

When Barras introduced Napoleon to the convention as a fit man to be entrusted with the command, the President asked, "Are you willing to undertake the defense of the convention?"

"Yes," was the reply.

After a time the President continued: "Are you aware of the magnitude of the undertaking?"

"Perfectly," replied Napoleon, fixing his eyes upon the questioner; "and I am in the habit of accomplishing that which I undertake."

"How could you," a lady asked about this time, "fire thus mercilessly upon your countrymen?"

"A soldier," he replied calmly, "is only a machine to obey orders. This is my seal which I have impressed upon Paris."

Napoleon's apt replies often excited good humor in a crowd. A large and brawny fishwoman once was haranguing the mob, and telling them not to disperse. She finished by exclaiming, "Never mind those coxcombs with epaulets on their shoulders; they care not if we poor people all starve, if they but feed well and grow fat."

Napoleon, who was as thin as a shadow, turned to her and said, "Look at me, my good woman, and tell me which of us two is the fatter."

The fishfag was completely disconcerted, and the crowd dispersed.

1796. "Good God!" Napoleon said in Italy, while residing at Montebello, "how rare men are. There are eighteen millions in Italy, and I have with difficulty found two—Dandolo and Melzi."

"Europe!" Napoleon exclaimed at Passeriano, "Europe is but a mole-hill; there never have existed mighty empires, there never have occurred great revolutions, save in the east, where lived six hundred millions of men—the cradle of all religions, the birthplace of all metaphysics."

One day Napoleon, conversing with Las Cases, asked him, "Were you a gamester?"

"Alas, sire," Las Cases replied, "I must confess that I was, but only occasionally."

"I am glad," replied Napoleon, "that I knew nothing of it at the time. You would have been ruined in my esteem. A gamester was sure to lose my confidence. I placed no more trust in him."

Some one read an account of the battle of Lodi, in which it was stated that Napoleon crossed the bridge first, and that Lannes passed after him.

"Before me! before me!" Napoleon exclaimed. "Lannes passed first, I only followed him. I must correct that error on the spot."

EARLY FLOWERS.

By FRANCIS GEORGE HEATH.

The fields and woods of January, when not covered by snow, offer much better opportunities for the study of flowers than we ordinarily believe. Mr. Heath has told, in his "Sylvan Spring," of all the early-comers of the year. If all the flowers which he mentions here are not found this season in a locality, observation extending through several seasons will undoubtedly reveal them. A carefully kept note-book of all the changes in vegetation, the growth, blossoming, etc., will be found most interesting.

January in temperate latitudes is popularly believed to possess no wild flowers in our lanes, fields or hedgebanks; and the reason for the common belief is that no one expects or looks for them, and there is no conspicuous color to attract attention to them at that ordinarily cold and apparently "dead" season of the year. Yet there are not less than twenty-five of our wild flowers that may be found in bloom *somewhere* in January.

A January has probably never yet been known during which it was impossible to find out of doors a daisy (*Bellis perennis*) in flower: not in the open meadow, or on the cold slope of the hillside, but at least in some sheltered nook where a streamlet may flow, unhindered by frost. Says Montgomery:

"On waste and woodland, rock and plain,
Its humble buds unheeded rise;
The rose has but a summer reign,
The daisy never dies."

And this last line explains the true meaning of the specific botanical name of the day's "eye"—*perennis*—which does not mean, as it is usually understood in botanical language, "perennial," simply to indicate that the daisy *plant* lives beyond a period of two years. It means "lasting throughout the year," that is to say, lasting in *blossom* throughout the year, for our daisy is *always* in bloom somewhere.

Another January flower, and one whose blossoms, though it is an annual plant, may be found throughout the year, is the purple dead nettle (*Lamium purpureum*).

Though much like its relative, the later-blooming white or common dead nettle, this pretty plant may be known from *Lamium album*, not only by the purple color of its curious flowers, a color with which its leaves and its leaf-hairs are sometimes suffused, but by its smaller size and by the curious crowding of its alternately-paired heart-shaped leaves on the upper part of the stem, a feature which is not common to its white-flowering congener. The unobservant pedestrian who may linger by the wayside to pluck something which strikes his fancy in the low hedgebank, must often have dreaded the touch of the harmless dead nettles, under the belief that these plants were the widely different, though similarly leaved, "stinging" nettles. If disabused of this impression and induced to handle a flowering stem of the purple dead nettle, with square stem and whorl of stalkless axillary blossoms, he will marvel at the singular-looking corolla, separated from its calyx of five sepals. The generic name *Lamium* comes from a Greek word which means throat, and that, as referring to the blossom, it is aptly applied, will be seen at once. From the depths of this throat, or the corolla tube, in other words, rise the stamens on their long filaments, covered by the upper and concave lip of the corolla, which hangs hood-like over them, whilst the lower lip (for this species belongs to the large natural order called *Labiata*, labiate or lip-flowered plants) is prettily marked with spots of darker purple than the normal color of the blossom.

Though the most we can do with the winter aconite (*Eranthis hyemalis*) is to rank it among our doubtful wild flowers, we must at least give it "honorable mention," noticing its whorl of green leaves at the apex of its solitary stem and its large, yellow, handsome blossom, for it is among the hardy little group of

plants which flower the nearest in point of time to the first day of the new year.

We must not fail to allude in our enumeration of early January flowers to that sweet little plant, the wild heartsease, or pansy (*Viola tricolor*), the progenitor of its host of garden namesakes. Its natural tendency to vary in the color as well as in the size of its blossoms, under varying conditions of growth, will explain the ease with which it can be made subservient to culture. Had it no beauty of its own, its relationship to the violets would claim for it our love and regard; but it is a flower which can not be passed over, for it seems to look at us out of its yellow and darkly-empurpled face with a sort of thoughtful earnestness.

The hellebores come within our enumeration of the January flora, and of these the bearsfoot or foetid hellebore (*Helleborus fatidus*) is the earliest in flower. It grows to a height oftentimes of two feet. Its smooth stem and leaves are dark green; its leaves narrowly lanceolate, serrated along the edges toward their apices. The large flowers are cuplike, are produced in panicles, or branched clusters, and are light yellowish green in color, the cluster of yellow-anthered stamens forming a conspicuous center to each corolla. Every part of the bearsfoot is highly poisonous, but the plant pleases the eye by its striking and handsome form.

It must naturally follow that exceptional hardiness is indicated by capacity to blossom in January. But among all our early flowering plants, there are two which may fairly claim the possession of an especial character for robustness of constitution; for, whilst those we have already mentioned are more or less susceptible to the influence of cold, and some of them will only produce their early blossoms in sheltered nooks, the two we are about to notice can bravely withstand hard frosts in exposed situations.

Of these, the first we shall name is the common groundsel (*Senecio vulgaris*), and a hardier little plant than this, of its kind, it would be scarcely possible to find. We have seen it in flower in the early part of January, when every stream, pond, and ditch around was frozen almost to the bottom, its soft leaves looking as fresh and glossy as if it had been the height of summer. The groundsel is a member of a little group which includes the ragworts, and they all bear yellow blossoms, and have a strong family likeness. *Senecio vulgaris* really flowers all the year round, and that is why we have it so conveniently among our early January blossoms. That it is so plentiful and so hardy is a wise provision of nature; for its leaves, the florets of its blossoms, and its seeds are very welcome additions to the food of our small birds, who have at least this provision for their comfort during the rigors of our frosts.

The other little wildling of the two we have especially mentioned as being among the hardiest even of the hardy January flora is the common chickweed (*Stellaria media*), a pretty little plant, which, because of its marvelous power of reproduction, and its persistency in intruding within the prim domain of the gardener, is by the last named individual regarded with feelings of bitter enmity, and is mercilessly exterminated whenever it comes into the realm of graveled path and nicely-kept border. Very different are the feelings of the small birds toward the chickweed, for it furnishes them with food which is eagerly sought after and keenly appreciated. Its power of branching and spreading is really marvelous, and it seems almost to lead a charmed life, for the most persevering attempts to uproot and banish it from the ground whereon it has once fairly established itself, ordinarily fail. We have said that its flowers are pretty, but perhaps some unobservant and unreflecting people hardly credit it with the production of blossom, for the minute, oblong, white petals are so much hidden by the green five-cleft calyx which is oftentimes larger than the corolla, entirely enveloping them when in bud, that they are inconspicuous among the mass of spreading green.

And now we have reached, in our pleasant task of enumer-

ating our earliest wild flowers, the delicate and beautiful snow-drop (*Galanthus nivalis*), the botanical name indicating a milk-white blossom; and though it can scarcely claim to take a place as

"The first pale blossom of the ripening year,"

it may be sometimes seen in bloom before the middle of January. Have the incurious and unobservant noticed more about this beautiful flower than that it is white and drooping, and early in appearing, and, of course, pretty? We fancy not. Yet this delicate white blossom will well repay careful and searching examination.

The advent of a buttercup in bloom in January would appear almost impossible to those who associate this plant only with the golden splendor of the May meadows; and it is a rare circumstance, but one, nevertheless, which has been noted, and noted, also, of the very buttercup (*Ranunculus repens*), to whose extensively creeping habit we owe so much of the profuse magnificence of the later spring. In the pretty lines familiar to almost every child,—

"While the trees are leafless,
While the fields are bare,
Golden, glossy buttercups,
Spring up here and there,"

we find the early-flowering fact recorded. And, again, the question arises, why is it that "here and there," before the general leafing time, a buttercup may be found to rear its golden head in one spot, while not far off—and, indeed, within sight it may be—there are tens of thousands of plants of the same species which will not blossom until months later? Sometimes the circumstances of position, in the case of the plant in flower, are so obviously more favorable than those of adjoining flowerless congeners, that the necessary explanation is furnished. But oftentimes the early flowering remains a mystery, in spite of all attempts at elucidation. Does not every one of us remember some occasion when a long walk early in the year has revealed the sight of but one daisy or buttercup in bloom in a locality, which, later on, would have been thronged by countless members of the same species? The mere recollection of the solitary flower which gladdened such a walk is delightful. How much more delightful the event itself!

We need, surely, make no apology for giving something more than mere mention of the dandelion (*Leontodon taraxacum*) in our enumeration of early flowers. It is, doubtless, a very "common" flower: but that we venture to think is the very reason why it should *not* be contemptuously dismissed as if it were not worthy of description or consideration. Very often it will happen that the familiar yellow blossom of *Leontodon taraxacum* is the first which we encounter in the early days of the year, and this hardy and persevering plant has this especial claim upon our regard, that it selects ordinarily the most desolate and dismal places as its habitats, covering them oftentimes with a gorgeous sheet of color. Townspeople, and poor townspeople especially, ought to love this plant, for it lights up with its golden glow the surroundings of the most bare and wretched of human habitations.

The dandelion is worthy of attention. The origin of its common name has given rise to some little discussion. That it is a corruption of the French *dents de lion* is very generally accepted; but in spite of varying opinions as to what part of the plant resembles a lion's teeth—whether its roots, by their whiteness, or its florets or leaves, by their indentations, we incline to the leaf theory. The circumstance to note in connection with the leaves is that their teeth-like lobes are turned backwards towards the root from which they all directly spring—a habit which is not at all common to plants with indented leaves. If we look, with a glass to assist the eye, at a dandelion leaf against the light, we shall find something to please us, and something to admire in its venation, in the acute points of the serratures, and in its smooth glossiness. Features of interest to note, too, are its brittle, fleshy, tapering, milky root-stock and

rootlets; its hollow, brittle, milky and radical flower-stem; and its buds, with the golden tips shining above the conspicuous involucre (a word derived from *involucrum*, a case, or wrapper), the involucre in the case of the dandelion consisting of two sets of green scales, the one set enclosing the yellow florets in the manner of a calyx; the other, and narrower set, consisting of a whorl of bracts, or leaf-like appendages, reflexed or bent down. When the blossom opens the upper bracts remain erect. And by-and-by the yellow florets disappear, and are succeeded, each, by a feathery pappus, connected by a slender stalk with a seed, and serving as a wing to bear the seed away when the ripening time arrives. The convex receptacle, in form so much like a pincushion, is, indeed, covered with seeds, whose feathery appendages are crowded into semi-globular form, ready, however, to take flight on the least breath of wind which may be strong enough to bear away to fresh fields and pastures new the tiny germs of the hardy life which lends the beauty of its presence to brighten forlorn waysides and neglected wastes.

We must include the crocus (*Crocus vernus*) among the possible flowers of January, although the flowering calendar of the gardener will ordinarily be found to assign a later date for its period of blossoming.

The crocus blossom offers the advantage of largeness to those who may wish to carefully study the curious organs of plant flowers. The most conspicuous external feature of the common crocus is the long-tubed purple perianth, divided into six segments, or pieces, constituting the vase-like flower head. Within the floral envelope are contained first the ovary, surmounted by a style which traverses the whole length of the long, narrow tube of the perianth, and is crowned just above the point where the tube expands into its petal-like segments, by a curious three-cleft stigma, each lobe of which is club-shaped or wedge-shaped, and jagged at its extremity. Some little distance below the level of the stigma are reared the anthers of the stamens, three in number. When the pollen grains from these organs have fertilized the ovary, by the agency of the stigma and style, the office of the perianth is fulfilled, and it, with the stamens and stigma, begins to wither and disappear. Then the ovary is enlarged, and rising on a slender stalk from the top of the bulbous root on which it was seated when the floral envelope was present, becomes exposed to the air, and ripens the seeds within its three-celled capsule.

In some of our woods in January may occasionally be found, though it is not widely distributed, the green hellebore (*Helleborus viridis*). The five oval-shaped, green lobes which form the floral envelope are not, as at first might be supposed, petals but sepals, the much smaller petals, eight or ten in number, occupying the inner portion of the blossom, and immediately surrounding the numerous stamens. These petals, or, as they might be called, nectaries, contain a poisonous honey, and the whole plant, indeed—leaves and flowers—is very poisonous.

We may perchance, before the month is out, light upon the pretty blue blossoms of the field speedwell (*Veronica agrestis*), with its hairy, deeply-indented and somewhat heart-shaped leaves, placed in opposite pairs along its branching stems, or, perhaps, upon its relative, *Veronica buxbaumii*.

In wood and copse before the close of January, we may note the sylvan precursor of the green splendor of the later spring—the leafing honeysuckle, the earliest harbinger of sylvan verdure in the days to come. The little leaves have not yet revealed their size and form, and without close examination the light-brown, spiry twigs would appear to wear only their normal wintry aspect. But if we look narrowly at them we shall note the tiny spots of green at the stem knots, where the minute leaves are struggling to emerge from the bud cases. Earliest in leaf among the shrubs and trees of the hedgerow and forest, the woodbine is the latest in flower—spreading, even late in autumn, its sweet fragrance through thicket, copse and dell.

Childhood is the sleep of reason.—Rousseau.

BOTANICAL NOTES.

By PROF. J. H. MONTGOMERY.

The numberless uses for india-rubber in this century has made it an indispensable article of commerce and manufacture, consequently its production has become a great industry. Whether the known forests will continue to supply the demand for any considerable time is a practical question. Right here comes the intelligence, that the attention of the government in India has been called to a new source of this useful gum. This new plant which yields large quantities of pure caoutchouc is a native of Cochin China, and is common in Southern India. It belongs to the *dog-bane* family (the same family that yields strychnine), and is called *Prameria Glandulifera*. In lower China its liquid juice is used for medicine by the Anamites and Cambodians, and it also appears among the drugs of China.

The Norwegian, Schübeler, mentions some striking peculiarities of plants in high latitudes. He says that seeds produced in these regions are much larger and weigh more than those grown in more temperate climates. The leaves, also, of most plants are larger in the north than those of the same species farther south. Flowers which are white in warmer climates, become colored when they blossom in the north. All these differences he ascribes to the continued light of long days.

It is noted by naturalists that Arctic plants are destitute of odor as a rule; only a few having a faint scent.

It appears from an English paper that the secretary of the Royal Society transplanted sea-weed to earth that was kept constantly moist, and that the plants grew and flourished under what would seem to be very unnatural circumstances. This would be an experiment worth trying with our fresh water plants.

By placing the stems of freshly cut flowers in a liquid dye their petals may often be colored or changed in color. This will not always happen, however, as certain colors are not absorbed by flowers. These dyes do not in any way change or affect the perfume or freshness.

The time honored method of determining the age of trees by counting their concentric rings has received some very hard blows from recent observations made on the growth of trees. An article in the *Popular Science Monthly*, from the pen of A. L. Childs, M.D., gives some facts which show that these rings do not indicate the age of the tree, and shows what they do indicate. The following passages from the article will give the ground on which his deductions are based: "In June of 1871 I planted a quantity of seed as it ripened and fell from some red maple trees. In 1873 I transplanted some of the trees from these seeds, placing them on my city lots in Plattsmouth, Nebraska. In August, 1882, finding them too much crowded, I cut some out, and, the concentric rings being very distinct, I counted them. From the day of planting the seed to the day of cutting the trees was two months over eleven years. On one, more distinctly marked (although there was but little difference between them), I counted on one side of the heart forty rings. Other sides were not so distinct; but in no part were there fewer than thirty-five. * * * Hence, from my own record, I knew the tree had but twelve years of growth; and yet, as counted by myself and many others, it had forty clear concentric rings. * * * Hon. R. W. Furness, late Governor of Nebraska, so well known as a practical forester, has kindly furnished me with several sections of trees of known age, from which I select the following: A pig-hickory eleven years old, with sixteen distinct rings; a green ash eight years old, with eleven very plain rings; a Kentucky coffee-tree ten years old, with fourteen

very distinct rings, and, in addition to these, twenty-one sub-rings; a burr-oak ten years old, with twenty-four equally distinct rings; a black walnut five years old, with twelve rings. * * * In conclusion, that the more distinct concentric rings of a tree approximate, or in some cases exactly agree, in number with the years of the tree, no one, I presume, will deny; but that in most, and probably nearly all trees, intermediate rings or sub-rings, generally less conspicuous, yet often more distinct than the annual rings, exist is equally certain; and I think the foregoing evidence is sufficient to induce those who prefer truth to error to examine the facts of the case. These sub-rings or additional rings are easily accounted for by sudden and more or less frequent changes of weather, and requisite conditions of growth—each check tending to solidify the newly-deposited cambium, or forming layer; and, as long intervals occur of extreme drought or cold, or other unfavorable causes, the condensation produces a more pronounced and distinct ring than the annual one."

C. L. S. C. WORK.

By Rev. J. H. VINCENT, D.D., SUPERINTENDENT OF INSTRUCTION.

The readings for January are: "Philosophy of the Plan of Salvation," fourteen chapters; Chautauqua Text-Book, No. 18, "Christian Evidences;" Chautauqua Text-Book, No. 39, "Sunday-school Normal Work;" Required Readings in THE CHAUTAUQUAN.

"Memorial Day" for January: "College Day," Thursday, January 31.

The map of southern Europe, by Monteith, contains a good map of Greece. Published by A. S. Barnes & Co., of New York. Price, \$5.

Persons who are reading for the additional White Seal for graduates of '82 and '83 need not read the Brief History of Greece if they read Timayenis, Vols. 1 and 2.

By sending forty cents to Miss Edith E. Guinon, Meadville, Pa., members of the classes of '82 and '83 may procure badges.

A student of the C. L. S. C. in Idaho writes: The pupils of the public school will one day be Chautauquans. There is enthusiasm over everything in the course that we enjoy together, and that is a considerable portion of it. We talked over the air when the loveliest blue mist hung for days between us and our most beautiful mountains' snowy peak. * * * My pupils have treated our very near Chinese neighbors with more consideration since the reading of "China, Corea, and Japan." * * * This is only the second year of school-life in our place, and we are largely indebted to the C. L. S. C. for help in overcoming some difficulties incident to a first struggle.

One good English sentence committed every day will greatly enrich one's vocabulary in the course of a year.

"Don't" is a good little manual of manners, but Miss Josephine Pollard's Chautauqua Text-Book, No. 43, on "Good Manners," is better. "Don't" fail to read and practice "Good Manners."

Try to pronounce your words accurately and distinctly. Accept with gratitude all hints which drive you to the dictionary. Avoid over-sensitiveness when corrected by fellow-student, friend or foe.

A telegraph operator writes: "Coming from the beautiful village of —, Wis., where I was a member of a flourishing circle, and finding myself in this little western town on the Minnesota prairies, how could I pass the long tedious hours of the night if it were not for the studies of the C. L. S. C.? I am a night operator for the railroad company, and while the great

majority of the great army of the C. L. S. C. are asleep and dreaming, I am studying. Thank God for the C. L. S. C.! How much broader life seems since I commenced these studies, and it is a pleasant thought to me that in '86, when I graduate, I shall possibly be able to go to Chautauqua, and to shake hands with you."

The Monteagle Assembly (Tennessee) last summer developed an intense C. L. S. C. enthusiasm. The meetings were lively, largely attended, and increased in interest to the very close of the Assembly. A committee was appointed to erect a C. L. S. C. building at Monteagle. I call upon all members of the C. L. S. C. to do what they can in the way of contributions to this Monteagle building. I am anxious not to turn the C. L. S. C. into an advertising channel for local interests, but the Monteagle movement, covering as it does the whole southern field, deserves our hearty sympathies, and I hope that many members will feel free to send contributions of any sum to the secretary, Rev. J. H. Warren, Murfreesboro, Tenn.

I take pleasure in commending to the members of the C. L. S. C. the "Comprehensive Biographical Dictionary," by Edward A. Thomas, published by Porter & Coates, Philadelphia. It contains several steel-plate engravings and 590 pages. Price, \$2.50 to \$4.50, according to the binding.

Miss S. A. Scull, of Philadelphia, has prepared, and Porter & Coates have published an admirable abridgement of "Greek Mythology," helpfully classified. It is amply illustrated and adapted to the school or to private use.

Every Chautauquan will mourn over the death of Mr. Van Lennep. He was a simple hearted, sincere, unselfish worker, a member of the class of '86, a true friend, a loyal Chautauquan.

Scripture Readings for January, 1884:

First week, Genesis, 1st chapter.

Second week, Genesis, 13th chapter.

Third week, Genesis, 23d chapter.

Fourth week, Genesis, 32d chapter.

OUTLINE OF C. L. S. C. READINGS.

JANUARY, 1884.

The required readings for January, 1884, include "Philosophy of the Plan of Salvation," by Rev. James B. Walker; Chautauqua Text-Book, No. 18, "Christian Evidences," and No. 39, "Sunday-school Normal Class Work;" the Required Readings in THE CHAUTAUQUAN.

First Week (ending January 8).—1. Philosophy of the Plan of Salvation, from the "Introduction," page 25, to the end of chapter ii.

2. Readings in German History and German Literature in THE CHAUTAUQUAN.

3. Sunday Readings for January 6, in THE CHAUTAUQUAN.

Second Week (ending January 16).—1. Philosophy of the Plan of Salvation, from chapter iii, page 59, to the end of chapter vi.

2. Readings in Political Economy and Physical Science in THE CHAUTAUQUAN.

3. Sunday Readings for January 13, in THE CHAUTAUQUAN.

Third Week (ending January 24).—1. Philosophy of the Plan of Salvation, from chapter vii, page 90, to the end of chapter ix.

2. Readings in Art in THE CHAUTAUQUAN.

3. Sunday Readings for January 20, in THE CHAUTAUQUAN.

Fourth Week (ending January 31).—1. Philosophy of the Plan of Salvation, from chapter x, page 122, to the end of chapter xiv.

2. Readings in American Literature in THE CHAUTAUQUAN.

3. Sunday Readings for January 27, in THE CHAUTAUQUAN.

SUNBEAMS FROM THE CIRCLE.

God speed our cause! God keep it true,
 Year after year its work to do,
 Until the perfect morn appears,—
 Until beyond the line of gray
 Climbs up to heaven the perfect day
 That ushers in the Thousand Years.

From a C. L. S. C. poem read before the local circle of Franklin, Mass., October 1, 1883.

In an editorial on the C. L. S. C. a Canadian editor makes the following computation: "The classes of the past numbered a total of 34,800. If 20,000 are added this year we shall have a school of 55,000. Last year's class numbered 14,000, an increase of sixty per cent. The same ratio will give us in another year a membership of 78,000, and in another year of over one hundred thousand. Think of a school of *one hundred thousand pupils!* Where will it stop?"

We have been asked to furnish the names and addresses of the various class presidents. They are as follows: President of class of 1882, Rev. H. C. Pardoe, Danville, Pa.; class of 1883, Rev. H. C. Farrar, Troy, N. Y.; class of 1884, Hon. John Fairbanks, Chicago, Ill.; class of 1885, Mr. Underwood, Meriden, Conn.; class of 1886, Rev. B. P. Snow, Biddeford, Me.; class of 1887, Rev. Frank Russell, Mansfield, O.

A Pittsburgh paper says: The Allegheny County Alumni Association of the Chautauqua Literary and Scientific Circle has become an institution. Composed as it is of the thinking people of Pittsburgh and Allegheny its success is not phenomenal, but is entirely merited. Last night the alumni were "at home" for the third time at the Seventh Avenue Hotel to their friends. They number about seventy people, and are as proud of their badges with their seals attached as a Knight of the Legion of Honor. The members and their friends met and chatted, much as other people do on such occasions, in the ladies' parlors. The guests were taken care of by the president and secretary in handsome style, and at 8:30 the banquet supper was announced. Supper over the guests were provided with pure cold water, with which to toast the association. Dr. Eaton said it was a most dangerous proceeding at that time of night, nevertheless it prevailed. Dr. Wood announced a song at the conclusion of his toast to the Circle. It was of the Chautauqua series, "We gather here as pilgrim bands." "The C. L. S. C., an untried experiment in 1878, but a grand success in '83," was the topic proposed for Prof. L. H. Eaton. He is one of the oldest and most enthusiastic members of the society, and has only missed one meeting in ten years at Chautauqua. The struggles and triumphs of the order was an easy subject to him and he was generally applauded at the conclusion of his remarks. "The order of the White Seal" by Miss Jennie Adair, followed. Mr. A. M. Martin, Secretary of the Grand Assembly of the Association, spoke upon "The Heroes." He gave a short history of the Circle. The women are pronounced the heroes. "The class of '83," Miss N. G. Boyce; Alumni Song of '83; "Our public schools the pride of the American people," Miss M. E. Hare; Select reading, Miss Lizzie K. Pershing; Grecian history, Mr. D. W. Jones; Lawrenceville class of '82, Thos. J. Ford; The Ladies, Professor Steeth. The toasts were all good, many of them humorous. When the party rose, it was an "all rounder" (cold water) to the prosperity of the Chautauquan culture.

A Pennsylvania member of the C. L. S. C. writes us: "I am a man in middle life (44 years old) with a family of four children to look after. I do a varied business, merchandising, lumbering and farming. I believe they call me the hardest working man in the village, but I have found time to complete the course, and have derived great benefit, as well as enjoy-

ment, while reading. My main object has been to prepare myself as best I could, under the circumstances, to better educate and direct the minds of the children growing up around me, and by encouraging good reading to drive the bad away."

The editor of the *Home and School*, Toronto, (Ont.,) has received the following from a young man in Manitoba: "You will probably remember that I wrote you in regard to some systematic course of reading just about three years ago, and that you sent me circulars of the C. L. S. C., and also said you would be happy to hear of my success in prosecuting the 'course,' etc. Well, owing to a change of circumstances and other unforeseen events, I have been unable to take the 'course,' though I procured some of the books, and have been a constant subscriber to THE CHAUTAUQUAN. I must thank you for sending me those circulars. The little I have read in the 'course' has been a very great benefit to me, indeed. It has improved my mind, and given me a greater desire for more knowledge; but, perhaps, better still is this: This year myself and a younger brother—I am twenty-two years old—have joined the 'Circle,' and we are at present talking about getting up a 'local circle,' and, indeed, have things about arranged for it. I was so pleased with all this that I could not refrain from writing and telling you, as you were the one who first sent me the circulars."

In a pleasant letter to THE CHAUTAUQUAN the secretary of the local circle of Muscatine (Iowa) says: "The graduates of 1882 still remain banded together, and are this year pursuing the special course of Modern History. 'Fifteen' is still a favorite number, the number with which the class was organized in 1878, the number that graduated, and the number that are at present pursuing the special course."

A paper in Muscatine, Iowa, furnishes this word picture: The Bryant memorial, at the residence of P. M. Musser, was one of the most pleasant and successful anniversary meetings in the history of the Muscatine Chautauqua circles. There was a large attendance of both circles and invited guests, and the program proved unusually interesting and entertaining. The music, which was so appropriately interspersed through the program, was of a high order of merit, each number exhibiting much practice and study. The literary program consisted mainly of finely-rendered recitations and readings from Bryant's poems. There was a charmingly-written sketch of Bryant's life, which abounded with valuable and interesting facts in regard to the great poet's life and the development and growth of his poetic genius; also a description of Bryant's 80th year memorial vase, whose design was so exquisite in beauty and expressive in sentiment. The special interest of the evening centered in the discussion on the question—Resolved, that Bryant, as a poet, is more American than Longfellow. The question was evidently adopted, not for the purpose of drawing odious comparisons or in any way detracting from the renown or genius of either of America's greatest poets, but for the purpose of presenting the special characteristics of both. After extending thanks to Mr. and Mrs. Musser for the cordial hospitality of the evening, the exercises closed. The Bryant memorial is an occasion to be remembered.

A lady has related to us this interesting experience in the C. L. S. C.: "In the fall of 1879, while going across the Rocky Mountains in a stage, a lady (a perfect stranger) told me about the C. L. S. C. She had the text-book on English History with her and was studying it. I had just completed a college course, but felt so unsatisfied with the little I knew, and was longing for some one to direct me. I knew not what to read, nor how to read. We were in the same town that winter—Bozeman, Mont.—and with a friend formed a circle of three. Next year I returned home (Missouri), but too late to have a circle. Our people had never heard of it. Well, a meeting was held and

our numbers ran up to forty-seven. How our hearts were gladdened! They have all joined as regular members, and seem so interested. Quite a number have expressed their regret to me that they did not join before."

The president of the Knoxville circle, Mrs. Delia Havey, graduated at Montegale last summer, being the first graduate from the southern Chautauqua. THE CHAUTAUQUAN has neglected to mention that there was a graduate at Montegale, but is very glad to note the fact.

At Lake View a New England Branch of the class of '85 was organized, with the following officers: President, Rev. J. E. Fullerton, Hopkinton, Mass.; vice-presidents, Miss Lena A. Chubbeck, New Bedford, Mass., Miss Alice C. Earle, Newport, R. I., Miss Marcia C. Smith, Swanton, Vt., Mr. J. B. Underwood, Meriden, Conn.; secretary and treasurer, Mr. A. B. Comey, South Framingham, Mass. The badge of class '85 can be obtained of the president. Each member of the class of '85 residing in New England is requested to send his name and address to the secretary at South Framingham, Mass.

The Augusta, Me., local circle puts a copy of THE CHAUTAUQUAN into the Y. M. C. A. reading-room of that city. Through the efforts of the secretary of the circle, a C. L. S. C. circle has been formed among the young men of the association. The Y. M. C. A. reaches in most places a large number of young men whose opportunities for culture are limited. Wherever a society is formed which offers them a systematic and thorough course of reading, they almost invariably will avail themselves of its advantages. Other circles may profitably follow the example of our Augusta friends.

Under the very efficient management of the president, Rev. B. P. Snow, the interests of the class of '86 are being subserved. He requests that secretaries of local circles in New England forward to the secretary of the New England organization of class of '86, Miss Mary R. Hinckley, New Bedford, Mass, name of circle, officers, number of members, and number of class of '86. Those reading alone are requested to forward name and residence. Let this be promptly attended to, that the organization of this energetic branch of the class of '86 may be completed.

LOCAL CIRCLES.

Canada (Toronto).—The Metropolitan Circle, C. L. S. C., held the first meeting of the season on Saturday evening, October 27th, and elected officers for the year. The commencement is an encouraging one, and we expect a good season's work. Nearly a quarter of the members are in the graduating class this year, and most of them will probably go to Chautauqua for their diplomas. I must thank the correspondent from Knoxville, Tenn., for the report from that circle in the November CHAUTAUQUAN. It has the right ring. We most heartily reciprocate the greeting, and trust that they, as we, are only in our infancy of strength.

Ontario (St. Thomas).—The *Evening Journal*, of St. Thomas, says of the first meeting of local circles in that city: The inaugural meeting of the St. Thomas Arc of "The Chautauqua Literary and Scientific Circle" was held last night. Thirteen members reported themselves ready for systematic reading. The work of organization was proceeded with and officers were elected for the ensuing term. The meetings are to be held every alternate Tuesday evening. After completing plans for work in detail, the following resolution relative to the death of the late Mr. Robert Armstrong, was moved and carried: Resolved, that we, the St. Thomas circle of C. L. S. C., desire to express our deep and heart-felt sorrow at the demise of our esteemed and estimable brother, Robert Armstrong, who was removed from our midst by the mysterious and yet wise hand of kind

Providence, all the more to be regretted from the fact that our late brother was taken away ere we had yet fully organized our local circle, he being among the first who united at the inception of it. And, also, we shall miss his cheerful face and his sterling Christian character in our intercourse. But at the same time we feel that what is our loss is his gain, he being admitted into that great circle and to the Fountain-head of all knowledge. Resolved, that our secretary be instructed to record these resolutions in the minutes of our circle, and that our city papers be furnished with a copy of the same.

Maine (Auburn).—The Auburn C. L. S. C. resumed its work in October, and holds its meetings every second and fourth Friday of each month. We have had large accessions to our membership, and we can no longer be accommodated in private parlors. We have obtained the use of the G. A. R. parlor, where we shall meet for the winter. We have used the questions in THE CHAUTAUQUAN in our work heretofore, but are now about to try the experiment of the Round-Table method. We think it a good plan to have every member contribute something toward the evening's work and instruction, and to that end "topics" are given out by the president, which are usually historical characters or subjects connected with our reading, and are given in at the next meeting in the form of short essays, or talks, just as the member chooses. We have music to open and close the sessions, and usually find time for some social converse after the work of the evening is over. On the occasion of our observance of Bryant's day, able papers on the "Life" and "Works" of the poet were read, and selections were read by various members, which, with music, made up a very enjoyable program. We have obtained of the county authorities the use of a room in the courthouse building (Auburn being a shire town), free of cost, to be used for natural history collections, and have already made a creditable beginning in the way of minerals. We shall solicit, not to say beg, specimens of anybody and everybody whom we think will be likely to heed our call. Last winter, under the auspices of the united circles of Auburn and Lewiston, Rev. George W. Perry gave a series of six lectures on Astronomy, illustrated by the stereopticon. Mr. Perry's enthusiastic interest in his grand theme, and marked clearness in conveying instruction make him an able lecturer, and his efforts resulted in much profit and quickening of interest among his hearers.

Massachusetts (Lynn).—The Thorndike local circle was formed in this city in October, 1882, with a membership of twenty, which increased during the year to forty, most of whom have kept up the required reading. We are very fortunate in having as our instructor Prof. Edward Johnson, Jr., a well known and successful teacher. Our meetings, which were public, were held in the ladies' parlor of the Boston Street M. E. Church. During the year our instructor gave us several interesting and instructive lectures on subjects connected with the study of the prescribed course. We also had a lecture by Rev. W. N. Richardson, of Saugus, a thorough Chautauquan, on "Self Culture, and the C. L. S. C.," and by the Rev. James L. Hill, of this city, on "How to be at home at home." Our meetings have usually been held monthly, but we have concluded we can do more and better work by having them oftener, and so have decided to meet at the homes of the members semi-monthly. Our meetings are full of interest, and there is an earnest determination among the members to make this year one of great success. We send greeting to our fellow students, and salute them in the words of the song, "All hail! C. L. S. C."

Massachusetts (Winchendon).—The Alpha Circle was organized in December, 1882, with a membership of eleven, and we now number eighteen. Our meetings are held once in two weeks, and are well attended. Our program consists of essays, readings, questions on topics studied, music, recitations, etc.

This year our Committee of Instruction has adopted the plan of choosing for each meeting two members to arrange the program. This gives a greater variety of work and increases the interest among all the members. We find the questions in *THE CHAUTAUQUAN* a great help, and frequently use the Chautauquan songs and games.

Connecticut (West Stratford).—A class of twenty-three members has been organized here this fall for C. L. S. C. studies. Much interest is felt, and our meetings are very thoroughly enjoyed. We are proud to add our names to the large army of students looking toward Chautauqua's noble halls.

Rhode Island (Providence).—Hope Circle began its second year by holding its first regular meeting October 22. About seventy-five persons were present. Miss Leavitt, who has visited Chautauqua, conducted a C. L. S. C. Round-Table, which the circle very much enjoyed. About fifty questions were asked, and a few could not be answered; those unanswered were given to a question committee, to be answered by them at the next meeting. We began with fifteen members, now number fifty-nine, and are constantly increasing. We hope, during the winter, to have the other circles which are forming here, meet with us and enjoy the lectures and talks which we propose to have. We celebrated "Bryant's Day" by holding appropriate exercises. The entertainment consisted of piano solos, sketches of the poet's life, reading of his most noted poems, and Chautauqua songs. All memorial days are celebrated in like manner.

New York (Saugerties).—Our little circle began the year's work with increased membership and interest. We now number fourteen. Our weekly meetings are very pleasant. We review the reading by questions and discussion, and have occasional essays. We have grown into the writing so gradually that the word "essay" has been robbed of its terrors. We began with "five minute sketches," and "essays" not exceeding six pages, all writing at the same time, though not always on the same topic. We found no difficulty in securing for our Bryant day a very entertaining paper from one of our young ladies, of a half hour in length.

New York (Troy).—Beman Park Circle, of this city, has fourteen members and four officers. A critic is also appointed at each meeting to observe all errors in language and report at the next meeting. A special feature of our meeting is that our president reads the lessons for one meeting ahead, and selects questions, giving two or three to each member for special study. Our meeting opens with the report of the secretary and the critic of the previous meeting; then the questions that have been given us are read and answered. Each one having given especial attention to his two or three questions, we can converse more intelligently than if we gave the same attention to all. Besides, each seeks to obtain all accessible information on his special subjects, which adds greatly to the interest of the meeting. After this exercise we spend a short time in conversation of a literary character, and then close.

South Carolina (Greenville).—On October 16 some of the young people of this place met and organized a local circle; we now have fifteen members. The membership consists mostly of young ladies and young gentlemen who have finished college, but are desirous of reviewing, and keeping up a literary taste. We endeavored, in our organization, to combine the good features of several different systems which we saw described in *THE CHAUTAUQUAN*. First, we have a question box, into which each member is expected to place at least one question and not more than four; these questions to have a bearing on the lesson for the evening. The questions are read out by the secretary, one at a time, and the president calls upon some member to answer it. After this we have music by some member of the circle. Thirdly, we have a selection read before the body, which

is followed in turn by an essay. Lastly, about twenty minutes is devoted to a general exercise, during which time any member may occupy the floor in delivering a short talk appropriate to the lesson, or may call upon some one else to do so. All of our members seem enthusiastic, and we think that much good will be done. We appoint a critic at each meeting to note the performances and pass criticisms thereon. We have a complete organization, with a constitution, by-laws, and a full set of officers.

Ohio (Perrysburg).—The local circle here was reorganized the last week in September. We have a membership of fifteen, an increase of nine over last year. This was accomplished by the earnest work of some of our last year's members, who were at Chautauqua during the past summer. We meet once a week. We follow the plan of work laid out in *THE CHAUTAUQUAN*, and enjoy it very much. Our meetings are always opened with one of the Chautauqua songs, followed by the reading of a responsive service, then we talk about the week's reading, or have some one appointed to question the class, and occasionally we have an essay or two. We celebrated Bryant's day by a little entertainment consisting of selected reading from his works, essays, and music. Each member invited two friends, so we had quite a gathering, and we all felt that the evening had not only passed pleasantly, but to us, at least, it was also profitably spent.

Indiana (New Albany).—Our circle is an ever widening one; indeed, it can scarcely be called a complete circle, as it is constantly being broken in order to allow others to join hands with those already enjoying its pleasures. The grading, however, is complete, there being seniors, juniors, sophomores and freshmen. No particular program is carried out. In our reading we mark anything especially interesting, or about which we wish an explanation; these points are asked for by the president, at the next meeting, and thoroughly discussed or explained. Sometimes when the members are undecided in regard to the answer to any particular question, it is left over for the next meeting, all the members in the meantime examining all the authority they can on the subject.

Illinois (Metropolis).—Our local C. L. S. C. for 1883-4 was organized September 28. Our membership at present is nine, consisting of beginners of the class of 1887. The manner in which the work has been taken up and is being carried on seems to indicate a year of solid work, and necessarily great profit. Our president is energetic and self-sacrificing; and with him as our leader we shall surely succeed.

Kentucky (Hardinsburg).—We are a new society, numbering only ten, organized last September by Miss Anna L. Gardiner, a graduate of the C. L. S. C. class of 1882. What we lack in numbers we make up in zeal. Already we feel that the Chautauqua course of reading and study is necessary to our existence. Our weekly meetings are delightful, and we are studying hard, determined that our circle shall be one of the bright stars in 1887. We celebrated Bryant's day with the following program: Opening exercises, Rev. R. G. Gardiner; Bryant's letter on the C. L. S. C., Miss Anna L. Gardiner; music, Myra Heston; "Planting the Apple Tree," Linnie Haswell; music, Charles Jolly; "The Death of the Flowers," Annie Bassett; music, Linnie Haswell; "Thanatopsis," Clare Jolly; music, Myra Heston; reading, Col. Alf. Allen; music, Miss Clara Jolly; "Forest Hymn," Myra Heston; music, Linnie Haswell; address on Life and Works of W. C. Bryant, Rev. J. G. Haswell; song, "Good-night," Miss Myra Heston.

Kentucky (Lexington).—The second year's work of the Lexington Social Circle began the first week in October, with a membership of thirty, adding to our last year's number several new names. Every month a committee of two is appointed by the leader to prepare questions upon studies we then have.

They have the right to appoint certain persons for any special subject that the lesson may suggest. To give a clear idea of how our circle is conducted I give the order of exercises of October 26. The class was called to order by the leader, and exercises were opened by singing one of the C. L. S. C. songs, followed by roll call, and the minutes of last meeting. Questions were then asked by one of the committee on the lesson in Greek History, bringing out all of the main points in the lesson; then followed questions on American Literature by the other member of committee, bringing in as special subjects, School and Life of John Stuart Mill, Swedenborgian Doctrines, and the Philosophy and Life of Coleridge; all of these having been mentioned in our text-book of Literature. Following these we had criticisms, our C. L. S. C. mottoes given in concert by the class, and the business of the circle. Two hours having been spent very pleasantly and profitably we had second roll call, each member giving a quotation in answer to their names, after which we adjourned.

Tennessee (Knoxville).—The Bryant memorial day was observed by our circle with appropriate services. The hall was tastefully decorated with ivy and flowers. A large picture of Bryant, wreathed with ivy, hung over the organ. The exercises were opened with the C. L. S. C. hymn, "A Song of To-day." At roll call each member responded with a quotation from Bryant. Essays were read on the "Life, Works and Death of Bryant," his "Influence and Friends," and "The Bryant Vase." The following poems were read: "Planting of the Apple Tree," "A Forest Hymn," and "The Flood of Years." The circle then joined in singing the closing hymn, "The Day is Dying." Many visitors were present, and the evening was pronounced by all exceedingly pleasant.

Tennessee (Memphis).—On October 1, 1883, a small band of Memphians met and resolved to pursue the C. L. S. C. course together, under the name of "The Southern Circle." Mr. L. H. Estes, a prominent young lawyer, who spent the month of August at Chautauqua, was elected president, and really it is to his earnest efforts that this circle owes its existence. We meet the first and third Monday of each month, and find the meetings both pleasant and profitable. All are highly interested in the studies, and hope by zealous work to make the circle well worthy of the name it bears.

Michigan (Flushing).—There are twenty-one members of the C. L. S. C. here. All are not able to attend our Hope class, which was reorganized and held its first regular meeting October 5. Eight of us belong to the class of '84, and to each the reading has been a source of much enjoyment and instruction.

Minnesota (Worthington).—The first meeting, held October 29, was very enjoyable. At roll call each member responded with a quotation from Bryant. A paper was then read on the Life and Works of the poet. A short time was given to recitation of the Greek History for the evening, with free conversation on obscure or imperfectly understood points in the studies. The evening was thoroughly enjoyed, and impetus given to a circle already in a flourishing condition.

Iowa (Des Moines).—The Alpha C. L. S. C. sends greeting to sister circles throughout the land. Our class organized last October with thirty members, and though to many of us—who left our school rooms long ago—the work seemed almost appalling, we have realized that we are never too old to learn, and that after a little application our lessons are mastered far more easily than we could have believed. The benefit is not merely what we have acquired during the year, but in the incentive we have to continue.

Missouri (Carthage).—The Carthage Literary Association, composed of the different societies known as C. L. S. C., Alpha, N. N. C., Shakspeare, and C. S. C., held a Longfellow me-

morial service June 1st, 1882. The program was as follows: Piano duet; sketch of Longfellow's life; reading—Rain in Summer; song—The Bridge; recitation—Famine; song—Rainy Day; essay—Longfellow's writings; reading (with chorus)—The Blind Girl; Story of Evangeline; The Chamber over the Gate; recitation—Launching of the Ship; Miles Standish's Courtship; song—Beware. Remarks were made by the president, altogether making a very pleasant and profitable reunion. Our second meeting, a Shakspeare memorial, was held at the Carthage Opera House, June 1, 1883. Program: Cornet solo—Old Folks at Home; essay—The Mound Builders; duet (vocal)—When Life is Brightest; reading—The Casket Scene, Merchant of Venice; solo—Waiting; essay—A Sketch of Elizabeth; Literature; tableau—Isabella; cornet solo—Mocking Bird and Variations; recitation—Le Cid; tableau—Charlotte Corday in Prison; essay—The Daughters of King Lear; solo—The Clouds have Passed Away; essay—Women of Ancient Greece; tableau—Queen Anne. The stage decorations were highly artistic. Not the least attraction was an elaborate monogram, copied from the title page of THE CHAUTAUQUAN. It was composed of scarlet geranium blossoms, the groundwork of the leaves, and rested upon an easel, facing the audience. It elicited many appreciative remarks. Other memorials have been held by the circle, both profitable and pleasant; the last upon Bryant's day.

Dakota (Chamberlain).—Here on the banks of the Missouri, more than a thousand miles from its birthplace, has the Chautauqua Idea found a home. We have formed a circle of twenty-seven members. Two of these belong to the class of '84; the rest are freshmen. In our number are a banker, an editor, a physician, a lawyer, two ministers, and a number of ladies who might well occupy any one of these positions. We meet once a week, and usually the week's readings are reviewed by topics drawn by each of the members from a prepared list. This week we are to have a Longfellow evening, and the first number of our paper is to be read. We intend that you shall hear again from your frontier outpost at Chamberlain.

California (Sacramento).—It may not be too late to mention our reunion of last June; it was held in the Presbyterian Church parlors, which were well filled with an intellectual and deeply interested audience. The place was beautifully decorated with a profusion of flowers; pillars were twined with ivy, and banners of the different nations whose history we had been studying were arranged upon the walls, with the American flag falling in graceful folds above the familiar C. L. S. C., which was formed of flowers, each letter of a different color, arranged in a half circle over 1883 in green. The literary exercises were followed by the report of the year's work, in which it was stated that twelve hundred and fifty pages had been read during the Chautauqua year of nine months; essays and papers, sixty-two; questions prepared by committees and answered in writing, nine hundred and twenty; total membership, thirty-eight; average weekly attendance, twenty. The circle this year has taken a step forward and has reached the rule of division, since our numbers have increased so rapidly. A second circle has been formed and named, in honor of our leader, "Vincet Circle." At our regular meeting on November 5, Bryant's memorial day was observed by an interesting program after our regular work had been done, omitting only our oral exercises. Our circle of twenty-one members has entered enthusiastically into the year's studies, and our method of work is as follows: Committees select several topics from each study, upon which papers are prepared and read the following week. From eight to ten papers are read at each meeting, and oral exercises, consisting of readings from THE CHAUTAUQUAN, the critic's report, together with our general business, complete the exercises. It is our intention to observe each memorial day, and arrangements are now in progress for an entertainment in which both circles will unite.

C. L. S. C. ROUND-TABLE.*

WAYS OF ORGANIZING LOCAL CIRCLES AND PROVIDING FOR THE POOR.

There are two points which I would be glad to have discussed a little this evening that are of great practical interest to us in extending the growth of the Circle into new territory. The first, in ways of extending the influence of the Circle, and of organizing new local circles. I do not mean ways of conducting circles, or plans of managing your circles, but ways of introducing the work where it is not now introduced, and of organizing new circles in localities that know little or nothing about the work of the C. L. S. C.

Upon this point I should be glad to have testimony or suggestions from any person who has had experience in that line. We all feel that this work should be done. We understand the embarrassments which prevent this extension. Yet, by comparing notes one with the other, we may be able to overcome the embarrassments. I should be glad this afternoon to hear from a number in answer to this question: "How can we organize new circles in localities that do not have them now?"

A VOICE: It seems to me, sir, if we would invite from the locality in which we want to introduce a circle, one or two persons to visit our own circle and see the work we are doing, we might thus incite and be enabled to form a circle, taking the one or two members whom we have invited as the nucleus.

MR. GILLET: I think this is a very valuable suggestion.

REV. W. D. BRIDGE: Make use of C. L. S. C. stationery.

A VOICE: I suggest this: Write an article for the local paper explaining the objects and operations of the Circle, and appoint a time and a place for all persons who have read the paper to meet and talk it over.

MR. GILLET: It is surprising to find out how many editors there are who know nothing about the C. L. S. C. It is a good plan to post them, especially local editors. Introduce them to the little green book, and get them to read it through, or ask them to listen while you read it to them. Any other suggestions?

I will say in that connection that a plan was organized or developed last year in what is known as the correspondence committee. I had hoped that I should be able to have a report from the correspondence committee of the Society of the Hall in the Grove. A plan was organized before leaving Chautauqua, concerning the way in which these articles for the papers should be written. The members of the committee wrote articles for the local papers, and corresponded with persons in different parts of the territory which they represented. As a result several new local circles were formed, and a good many were induced to become members of the circle.

A VOICE: I live in a little town of about one thousand inhabitants. We had already organized a reading circle composed of judges, clerks, merchants, mechanics, business men, and women. We were thinking of taking the course of the C. L. S. C. We shall have no difficulty in getting persons to come for the purpose of organization. I would like to know how we should proceed after we have gotten our people together. How would you organize and conduct a local circle?

MR. GILLET: The question has been asked several times during the Assembly, and has been answered by numerous testimonies from persons who are managers of local circles. The best way is the simplest, appointing as few officers as possible, having some one who will be responsible as conductor or leader of the circle, and then put as much enthusiasm and life into the organization as possible. The local circle organizations vary almost as widely as the different places in which the circles are organized. The organizations depend on the number, the plans, and the dispositions of the persons who belong

to the circle. There are parlor circles, church circles, union circles. Miss Kimball will be able to answer at the office any specific question.

REV. MR. PARDOE: I believe that local circles will organize themselves, if the people understand the nature and the methods of our C. L. S. C. work. There is a gentleman in New York City who has a business engagement with about two thousand of the leading weekly papers of this country, and he proposes to insert an advertisement of any kind in the two thousand weekly papers at a very low rate. I think it would be a very wise thing for the parent organization at Plainfield to make a contract with this gentleman, and throw the whole nature, methods, objects and intentions of the C. L. S. C. work over the United States at one bound.

MR. K. A. BURNELL: In connection with this matter of correspondence, last week a lady told me that she was a member of the correspondence committee, and gave me a very interesting account of the letters she had received, and the joy that she had from the letters that came to her.

A GENTLEMAN: In the part of Pennsylvania from which I come there are literary societies in almost every school house. Could we not in some way bring these societies into our circle?

MR. GILLET: Is there any way of getting the members of such societies into the C. L. S. C.?

A GENTLEMAN: There is.

MR. GILLET: It is not necessary to abandon the organization that already exists to have all the members read the text books of the C. L. S. C. The work can be done under the organization existing, the circle reading the books and reporting to the central office.

MR. GILLET: There is a little bit of tract about an inch and a quarter square, of four pages, that gives the points of the C. L. S. C. At Island Park we sent persons to the back of the audience with a bunch of these tracts, scattered them in the air and everybody was curious to get them and read them. I think a good many became interested who would not but for these little bits of things.

MR. BRIDGE: I will have 20,000 of them here to-morrow night for distribution.

MR. GILLET: Then, of course, you can get the Popular Education Circular by addressing Miss Kimball. It contains the full plans of the C. L. S. C., and you can use them in your correspondence. Any thing else to suggest?

A LADY: There would be no difficulty in organizing circles, but how shall we get people to understand the work and the methods that are adopted. A great many very intelligent persons have given so little attention to this movement as to be utterly in the dark. It will require a good deal of persistence in this work of organizing circles. I have had five years' experience. I have been through the class of '82, and have, unfortunately for the circle, I think, been retained as leader of the circle. We have four circles which coöperate. We found some difficulty in interesting the pastors of the churches in this work. I wish every member of the C. L. S. C. here when she goes home, because I rely on the ladies, to go to her pastor and personally solicit him to take hold of this work and assist her to organize a local circle. We did this in our circle. We secured the services of the pastor as president. We interested him. He took hold of it, and has been quite an assistance to us all the time. I content myself with taking a book and sitting as superintendent, so as to keep the work going on.

It will be necessary to go to young men and women, and older persons, and personally solicit them to join; personally explain to them the nature of the course of reading, and how it is done. You will have to do that by going to them personally until you get them, and then it will require a good deal of grace and a good deal of energy and perseverance to keep them in the Circle after they are there. Young men who work all day at the bench, or in the office at their books, complain that they have not time to read, and you have to overcome that ob-

*Seventh Round-Table, held in the Hall of Philosophy, August 22, 1883, at 5 p. m., Rev. A. H. Gillet conducting.

jection. You must show them that they have the time, and that they can do it. Why, almost every young man, and I may say almost every young woman, spends more time reading the daily newspapers than it would require to read the whole course of the C. L. S. C. in any year. By bringing these things to the attention of these persons you may thus induce them to make an extra exertion in this line.

I say to them in this way, that so far as I am personally concerned, I have not an hour in a week, I have not five minutes in a day to devote to this work, yet for the purpose of inducing them to go into the work, to go into the course of reading, I make the sacrifice and do double work. When they see that one person can do that, they feel like making the effort themselves.

Then I have gone to the newspaper offices and have written up reports of the meetings of the circle. I have taken occasion in these little articles, writing up the proceedings of our meetings, to explain what was meant by the C. L. S. C. course of reading. There are a thousand things we might do for the purpose of inciting an interest in this work.

MR. GILLET: It has been suggested that members might arrange for a series of meetings in September in the cities or large towns near to their homes and send out to these cities or villages one or two of the members of their own circle to talk about the C. L. S. C. and answer such questions as might be asked, requesting the pastors of the churches to announce that the meeting would be held on such an evening of the week. Then let them proceed at once to the organization of a local circle, and appoint persons to take charge of it. I think that there are very few towns in which such local circles could not be organized, if such a course should be taken. Any suggestions in this line? I want to call your attention to another thing, and call out a few suggestions upon as interesting a proposition as the other one. It may be delicate, and I hardly know whether we may be helped by stating it, but I think we may, and I will take the risk, at least, of presenting it. We recognize the fact that a great many people who are connected with the C. L. S. C. are poor; that a great many more would be connected with it but for the fact that they are unable to provide the necessary books, or to incur the simple expense even that a membership in the C. L. S. C. involves. I would like to know if there are any here who have any ways in connection with their local circle work to reach such cases. I think it would aid other circles, and help in aiding a deserving class of people that we are not able now to benefit.

A GENTLEMAN: If some person who has graduated would loan his books to persons who were pursuing the course, it would help them.

MR. GILLET: So far as the books would be usable. The books are changed somewhat each year.

A LADY: We have in Cincinnati a fund for that purpose. We get a few lecturers each year, and have a fund for that purpose. Last year we sent to the different libraries sets of our C. L. S. C. books, and we hope to do that every year, so that we can reach our members through the public libraries by tickets, so that some will not have to buy any books, except the little ten cent books.

MR. GILLET: How many sets of the larger books? Just one set?

A LADY: No, sir, we duplicate some of them. We duplicated the astronomy and some of the larger books.

MR. GILLET: I think the point mentioned is a good one, sets of books in the City Library, and the Women's Christian Temperance Library, or the Y. M. C. A. libraries, or in the church libraries, or Sunday-school libraries. Any other suggestions?

A GENTLEMAN: That would be the best plan—to put them into Sunday-school libraries.

MR. BRIDGE: We have in New Haven a Women's Christian Association with a very flourishing C. L. S. C. branch. There is no membership in the Y. M. C. A. as such. I think it would

be a good thing for our Women's Associations in the towns and cities to make circles of the C. L. S. C.

A GENTLEMAN: In the place where I am there was no regular circle. We only read a partial course, but we intend to join this Circle this year. We gave some entertainments, and we have a fund of \$200 to buy books for this circle.

A GENTLEMAN: In the local circle to which I belong we had a course of lectures which netted us a little sum of money, and we invested that in two sets of C. L. S. C. books last year, and there were two members who were able to join us who would not otherwise have done so.

WRITTEN QUESTION: What would be suggested as the next step after an interview with the pastor and his refusing to assist?

MR. GILLET: Organize without him. I do not know of any other way.

A GENTLEMAN: In large cities many churches have lyceums and literary societies. The city of New York was my birth-place, and until a few years I never heard of the C. L. S. C., and, therefore, I think the suggestion to advertise it very wise, especially in all the large cities. Where there are church lyceums the C. L. S. C. could be very well introduced without having to go through the introductory stage. In this way these church organizations could be made very efficient, I believe. Then church organizations so organized have gone through the initiatory steps. I speak from experience, because I know that in these organizations they lack very much the literary portion, and they need some such systematic work as mapped out by the C. L. S. C., to make them more practical and beneficial. In these large cities you have the organization ready at your hand, and all you want is to give the impetus and the necessary instructions, and put before them this work. I speak of such cities as Newark, New York and Buffalo. There is not so much knowledge in them as there is in some of our small inland towns.

MR. GILLET: A very admirable suggestion. One of the ways in which this correspondence committee would be of vast service to the C. L. S. C. would be along this line.

MR. BRIDGE: New York City has only one local circle.

MR. GILLET: Of course there are readers there, but no local circles. There is very little being done in Chicago. That ought not to be so. If persons who are members, who have a little leisure, will assist the correspondence committee in the circulation of advertising matter and in personal letter writing each year, it will be a great help. I think the problem in advertising is this—an advertisement is headed with the letters C. L. S. C., perhaps in a magazine, and people think it may be some secret society, or something else, and turn from the page.

QUESTIONS AND ANSWERS.

SIXTY QUESTIONS AND ANSWERS ON "PHILOSOPHY OF THE PLAN OF SALVATION."—CHAPTERS I TO 14, INCLUSIVE.

By A. M. MARTIN, GENERAL SECRETARY C. L. S. C.

1. Q. What is the first fact developed in the experience of the human family to be considered as a preparation for the investigation which the author makes? A. There is in the nature of man, or in the circumstances in which he is conditioned, something which leads him to recognize and worship a superior being.

2. Q. To what extent is this characteristic true of man? A. It is true of him in whatever part of the world he may be found, and in whatever condition; and it has been true of him in all ages of which we have any record, either fabulous or authentic.

3. Q. What is the second fact connected with the first one stated? A. Man, by worshiping, becomes assimilated to the moral character of the object which he worships.

4. Q. What history bears testimony to this fact? A. The whole history of the idolatrous world.

5. Q. Leaving the God of the Bible out of view, what has been the character of the objects man has worshiped? A. Those objects have always had a defective and unholy character.

6. Q. What third fact is stated in connection with the other two already given? A. There were no means within the reach of human power or wisdom by which man could extricate himself from the evil of idolatry, either by an immediate, or by a progressive series of efforts.

7. Q. How is this fact maintained? A. From the history of idolatry, the testimony of the heathen philosophers, and the nature of man.

8. Q. What is said of the means and instrumentalities by which his redemption would have to be accomplished if man were ever redeemed from idolatrous worship? A. It would have to be accomplished by means and instrumentalities adapted to his nature and the circumstances in which he existed.

9. Q. What was the first thing necessary to be accomplished for man to relieve himself from the corrupting influence of idolatry? A. That a pure object of worship should be placed before the eye of the soul.

10. Q. What was the second necessary thing in order to man's redemption? A. That when a holy object of worship was revealed the revelation should be accompanied with sufficient power to influence men to forsake their former worship, and to worship the holy object made known to them.

11. Q. What is mentioned as having a tendency to unite the minds of a whole people into one common mind? A. Any cause which creates a common interest and a common feeling, common biases and common hopes in the individual minds which compose a nation.

12. Q. What are some of these causes that are especially strong? A. A common parentage, a common religion, and a common fellowship in suffering and deliverance.

13. Q. Upon what people did these causes operate with peculiar force? A. The Israelites.

14. Q. What follows as the only rational conclusion in regard to the discipline of the descendants of Abraham? A. First, that the overruling intelligence of God was employed in thus preparing material for a purer religious worship than the world then enjoyed; and, second, that a nation could have been so prepared by no other agent, and in no other way.

15. Q. What is essential for man to believe that religion has a divine origin? A. Man can not, in the present constitution of his mind, believe that religion has a divine origin unless it be accompanied with miracles.

16. Q. If, therefore, God ever gave a revelation to man, with what was it necessarily accompanied? A. With miracles, and with miracles of such a nature as would clearly distinguish the divine character and the divine authority of the dispensation.

17. Q. In order to give any divine revelation to the Israelites what two things were necessary? A. First, that God should manifest himself by miracles; and, second, that those miracles should be of such a character as evidently to distinguish them from the jugglery of the magicians, and to convince all observers of the existence and omnipotence of the true God, in contradistinction from the objects of idolatrous worship.

18. Q. In view of the idolatrous state of the world, and especially in view of the character and circumstances of the Israelites, of what is the demonstration conclusive in regard to the miracles of Egypt? A. That the true God could have made a revelation of himself in no other way than by the means and in the manner of the miracles of Egypt; and none but the true God could have revealed himself in this way.

19. Q. In view of the established laws of the mind, how was it necessary that the knowledge of God and human duty should be imparted to the Israelites? A. By successive communica-

tions—necessary that there should be a first step, or primary principles, for a starting point, and then a progression onward and upward to perfection.

20. Q. In accordance with these principles God revealed only what in the introduction of the Mosaic dispensation? A. He revealed only his essential existence to the Israelites.

21. Q. In what way does love for another always influence the will to act? A. In such a way as will please the object loved.

22. Q. What are the most favorable circumstances possible to fix an impression deeply upon the heart and memory? A. First, that there should be protracted and earnest attention; and, second, that at the same time that the impression is made the emotions of the soul should be alive with excitement.

23. Q. In view of the nature and circumstances of the Israelites, what may be affirmed without qualification as to the wonderful series of events connected with the exodus from Egypt? A. That no combination of means, not including the self-sacrifice of the benefactor himself, could be so well adapted to elicit and absorb all the affections of the soul.

24. Q. What are the four conclusions reached in regard to the Israelites at this point in the investigation? A. 1. That they were bound to each other by all the ties of which human nature is susceptible. 2. Their minds were shaken off from idols. 3. They had been brought to contemplate God as their Protector and Savior. 4. They were without laws, either civil or moral.

25. Q. What fact, in regard to a rule of human duty, has the whole experience of the world confirmed beyond the possibility of skepticism? A. That man can not discover and establish a perfect rule of human duty.

26. Q. What is that power in the soul which pronounces upon the moral character of human conduct itself dependent upon and regulated by? A. The faith of the individual.

27. Q. What is said of a law adapted to man's nature? A. It must be addressed to the understanding, sanctioned by suitable authority, and enforced by adequate penalties.

28. Q. In accordance with these legitimate deductions, what did God give the Israelites? A. A rule of life—the moral law—succinctly comprehended in the ten commandments.

29. Q. In order to promote right exercises of heart in religious worship, with what was it necessary that the Israelites should be made acquainted? A. With the holiness of God.

30. Q. In what manner was the idea of God's moral purity conveyed to the Israelites in accordance with the constitution and condition of the Jewish mind? A. By the machinery of the Levitical dispensation.

31. Q. Of what is the demonstration conclusive, both from philosophy and tact, as to the true and necessary idea of God's attribute of holiness? A. That it was originated by the patterns of the Levitical economy, and that it could have been communicated to mankind, at the first, in no other way.

32. Q. What is the only way in which a lawgiver can manifest his views of the demerit of transgression? A. In no other way than by the penalty which he inflicts upon the transgressor.

33. Q. The more holy and just any being is, what follows as to the penalty he would inflict for sin? A. The more he is opposed to sin, the higher penalty will his conscience sanction as the desert of transgressing the Divine law.

34. Q. In what way only would the mind of man receive an idea of the amount of God's opposition to sin? A. By the amount of penalty which he inflicted upon the sinner.

35. Q. By means of burnt offerings what idea was distinctly and deeply impressed upon the minds of the Israelites? A. That God's justice was a consuming fire to sinners, and that their souls escaped only through a vicarious atonement.

36. Q. When would the Mosaic machinery, which formed the abstract ideas, conveying the knowledge of God's true character, be no longer useful? A. After those ideas were orig-

inated, defined, and connected with the words which expressed their abstract or spiritual import.

37. Q. In order to the diffusion of the knowledge of God throughout the world by the method adopted by the Almighty, what three things would be necessary as pre-requisites, and which are facts as matters of authentic history? A. 1. That the Jews who possessed those ideas should be scattered throughout the world. 2. That their propensity to idolatry should be entirely subdued. 3. That the new and spiritual system should first be propagated among those who understood both the spiritual import of the Hebrew language, and likewise the language of the other nations to whom the Gospel was to be preached.

38. Q. What followed as soon as the new dispensation had been introduced, and its foundations firmly laid? A. Jerusalem, the center of the old economy, with the temple and all things pertaining to the ritual service, was at once and completely destroyed, and the old system vanished away forever.

39. Q. What is necessary in order to a perfect system of instruction? A. There must be both precept and example.

40. Q. In what way only could human nature be perfected? A. Only by following a perfect model of human nature.

41. Q. Who is that model character? A. Jesus Christ.

42. Q. Of what is the demonstration manifest that man has received through the medium of Jesus Christ? A. A perfect system of instruction; and a final and perfect revelation of duty to God and man could be given in no other way.

43. Q. What are two facts history furnishes that are peculiar proofs of the Messiahship of Christ? A. First, the Jewish prophets lived and wrote centuries before the period in which Jesus appeared in Judea; second, on account of intimations, or supposed intimations in their prophecies, the Jews were expecting the Messiah about the time that Jesus appeared in Judea.

44. Q. If a person had appeared and conformed to the views which the Jews entertained of a temporal Messiah, of what would it have been direct evidence? A. That he was an imposter.

45. Q. Give three reasons for this conclusion? A. 1. Because their views were partial, prejudiced and wicked. 2. He could not have conformed to their views and sustained at the same time the character of a perfect instructor. 3. He would not have fulfilled the predictions of the prophets concerning him.

46. Q. What follows, therefore, legitimately and conclusively? A. That Jesus Christ was the Messiah of God.

47. Q. In what other way was it necessary that Jesus should establish his claim as the Messiah? A. By miraculous agency.

48. Q. What condition in life would it be necessary that the Messiah should assume in order to benefit the human family in the highest degree by the influence of that condition? A. In that condition which would have the most direct influence in regard to the condition Christ assumed? A. That Christ assumed the only condition which it was possible for him to assume and thereby destroy pride and misery, and produce humility and peace in human bosoms.

49. Q. As it is an acknowledged and experimental fact that the soul finds rest only in meekness, and never in selfishness and pride of mind, of what is the demonstration therefore perfect in regard to the condition Christ assumed? A. That Christ assumed the only condition which it was possible for him to assume and thereby destroy pride and misery, and produce humility and peace in human bosoms.

50. Q. In constituting the human soul, upon what has God, in accordance with his own character, caused its happiness to depend? A. Upon righteousness and goodness.

51. Q. What was the whole force of the Savior's teaching and example designed and adapted to produce? A. Righteousness and benevolence.

52. Q. What conclusion follows from these two statements? A. That Jesus was the Christ of God; because the Christ of God could found his instructions upon no other principles.

53. Q. What are the only two means by which truth can be

brought into contact with the soul? A. By perception and faith.

54. Q. What are their effects upon man's conduct and feelings? A. They are nearly the same, with the following remarkable exception: Facts, which are the subjects of personal observation, every time they are experienced, the effect upon the soul grows less; while, on the contrary, those facts which are received by faith, produce, every time they are realized, a greater effect upon the soul.

55. Q. This being true, which would be the method the better adapted to bring the sublime truths of the new dispensation to bear upon the souls of men? A. Faith.

56. Q. What moral powers of the soul does faith govern? A. The conscience and the affections.

57. Q. Upon what does man's interests, temporal and spiritual, depend? A. Upon what he believes.

58. Q. What does the belief of falsehood always destroy, and how does the belief of truth guide man, and what does it secure for him? A. The belief of falsehood always destroys man's interests, temporal and spiritual, and the belief of truth invariably guides man aright and secures his best and highest good.

59. Q. It having been demonstrated that righteousness and benevolence is the greatest good of the soul, what doctrine is necessarily true? A. That doctrine which rectifies the conscience, purifies the heart, and produces love to God and men.

60. Q. What vital and necessary principle did Christ lay at the foundation of the Christian system? A. "He that believeth and is baptized shall be saved, and he that believeth not shall be damned"—saved in accordance with the moral constitution of the universe, and damned from the absolute necessities existing in the nature of things.

CHAUTAUQUA NORMAL CLASS.

Season of 1884.

LESSON III.—BIBLE SECTION.

The Bible an English Book.

By REV. J. L. HURLBUT, D.D., AND R. S. HOLMES, A.M.

The Divine Revelation, whether spoken or written, has ever been made to any people in their own language. But as languages change their form and cease to be spoken, that which is plain to one generation becomes an unknown tongue to another. Hence arises the need of versions or translations. In the stages whereby the Bible became an English book, we notice: 1. The ancient versions; 2. The mediæval versions; 3. The modern versions. The student will observe concerning each version: 1. The Scripture included; 2. Language; 3. Date; 4. Place; 5. Authorship; 6. Historical notes.

1. *The Ancient Versions.*—Out of many, we select the five most important:

1. *The Septuagint.*—The Old Testament; from the Hebrew into the Greek, begun at an uncertain date, but completed about 385 B. C., at Alexandria, the metropolis of the Mediterranean, where a third of the population were Jews; by unknown writers, said to have numbered seventy, hence its name Septuagint, "Greek, seventy." This translation, though strongly opposed by the Jews of Palestine, became the Bible of all the Jews of the Dispersion throughout the eastern lands.

2. *The Samaritan.*—Containing the Pentateuch only, in a dialect, the mixture of Hebrew and Aramaic, spoken by the Samaritans, who worshiped on Mt. Gerizim; perhaps made as early as 100 B. C., perhaps later; traditionally said to have been translated by the Samaritan high-priest, Nathanael. For many centuries the existence of this version was questioned, until a copy was brought to Europe in 1616.

3. *The Peshito.*—The whole Bible, in the Aramaic language,

the common dialect (Peshito means "simple" or "common") of the Syrians, perhaps that spoken by Jesus and the Apostles, of unknown authorship and date, perhaps about 175 A. D.; the first translation made under Christian auspices.

4. *The Targums*.—A Hebrew word meaning "interpretations;" a series of Jewish translations of various parts of the Old Testament; ten in number, several covering the same books; in the Chaldaic dialect of Hebrew, dating from Onkelos, A. D. 250 to 1000; arising from the oral translations handed down in the synagogues, written after the destruction of Jerusalem.

5. *The Vulgate*.—Word meaning "common;" whole Bible, in Latin language; completed about A. D. 400, at Bethlehem in Judea, by Jerome; made by revising older Latin translations; at first opposed, but finally the standard Bible of the Roman Catholic Church.

II. *The Mediæval Versions*.—Not many translations were made during the Dark Ages. 1. *Cædmon*, a monk (died 680), translated the Bible stories into rude Anglo-Saxon verse. 2. *Aldhelm* (died 709), a bishop, translated the Psalms into verse. 3. *Bede* (died 735), "the venerable," translated the gospel of John into Anglo-Saxon, completing the work on the day of his death. 4. *King Alfred* (died 901), best of the kings of England, translated certain portions, as the laws of his kingdom, called "Alfred's Dooms." 5. *Wiclif* (died 1384), "Morning Star of the Reformation," a great scholar and enemy of Rome, translated the New Testament into English in 1380, and, aided by friends, the Old Testament in 1384. This great work was in manuscript only, as printing was not yet invented.

III. *The Modern Versions*.—The Reformation brought forth the Bible from neglect and called out numberless versions, of which we notice only a few of the greatest in English history.

1. *William Tyndale*.—One of the early reformers made the best translation ever wrought by any one man. This New Testament was issued in 1525; the Old Testament not until after his martyrdom in 1536.

2. *Miles Coverdale*, a friend of Tyndale, made the first English version by the consent of King Henry VIII., issued in 1535; made not from Greek text, but from Luther's German Bible and the Vulgate; hence, less literal than Tyndale's.

3. *The Great Bible* (1539), made by command of Henry VIII., by the influence of Thomas Cromwell; the first edition a revision of Coverdale and Tyndale; second edition 1540, under direction of Archbishop Crammer, hence known as "Crammer's Bible;" a book of great size, chained to the reading desk in the parish churches.

4. *The Geneva Bible* (1560), made at Geneva, Switzerland, by a number of Puritan exiles from England. Its principal translators were Whittingham, Gilby, Coverdale (above named), and perhaps John Knox; a convenient quarto; the best translation of the time; very popular with the Puritan element in the English Church.

5. *The Bishop's Bible* (1568), under direction of Matthew Parker, Archbishop of Canterbury under Queen Elizabeth; mainly a revision of the Great Bible; prepared as a rival to the Geneva version, but never as popular among the people, though used among the clergy.

6. *The Douay Bible*, a Roman Catholic version, made not from the original, but from the Vulgate; the New Testament published at Rheims in 1582, the Old Testament at Douay in 1609; the version in use among Romanists, having many notes setting forth their views.

7. *The Authorized Version* (1611), the translation now in general use, made by forty-seven scholars under direction of King James I.; begun in 1607, published in 1611.

8. *The Revised Version* (1881), prepared by a company of English and American scholars; in the main, much more exact than the authorized version, and deserving of general adoption.

SUNDAY-SCHOOL SECTION.

LESSON III.—THE TEACHER'S OFFICE AND WORK.

In this brief outline we propose to consider the teacher's office and work in five aspects:

1. *The work of the teacher is for the gospel of Christ, hence, first of all, the teacher should be a Christian*.—No person can properly instruct others in the Gospel unless he be devoted to the service of Christ.

1. *He should be a Christian in belief*.—No one can speak confidently and earnestly in behalf of a cause unless he believes in it. One can teach mythology, but not Christianity, without a firm conviction that the Bible is God's book, and the Gospel the declaration of the divine plan for saving men.

2. *He should be a Christian in experience*; having passed from death unto life, enjoying the consciousness of sonship, and a communion with Christ; for only in this state can he enter into sympathy with the Gospel, understand its mysteries, and guide others into the way of salvation.

3. *He should be a Christian in life*.—The example will teach more weightily than the words; therefore he must show forth in his conduct the character which he would impart, and live in the realm to which he would lead his class.

II. *The teacher's work is under the auspices of the church, and therefore the teacher should be a church member*.

1. *He should be a church member in profession*, giving to the church the benefit of his influence in the community, in return for all the benefits that the church gives to him.

2. *He should be a church member in loyalty*, holding an attachment, not to the church in general, but to that particular church whose doctrines, forms, methods and spirit are most nearly in accord with his own views, and best adapted to aid his growth in grace; devoted to it, laboring for it, and self-denying in behalf of it.

3. *He should be a church member in work*.—There are two classes of people in every church, the idle and the working, those who are carried, and those who carry. The teacher should be one of the working members, bearing the church upon his heart and its work in his hands.

III. *The teacher's work is with the Bible, and therefore the teacher should be a Bible student*.

1. *A Bible student in teachableness*, going to the Word, not in the spirit of criticism, but of reverence; studying it not to inject into it his own opinions, but humbly to obtain truth which shall feed his own soul, and supply the needs of his class.

2. *A Bible student in diligence*.—The cursory glance at a book may answer for the careless reader, but he who has it as his work to teach the Word, must study it; not only the lesson, but the volume which contains the lesson, for unless he has knowledge of the book at large, he cannot understand the specific lesson for his class; therefore the teacher should be a constant, persevering, laborious student of the Bible.

IV. *The teacher's work has relation to living souls, and therefore he must be a friend*.—No mere machine can teach living hearts; to influence souls there must be a soul, not by knowledge only, or by gifts of expression, but by the relation of heart more than by any other power can scholars be led upward to the best in thought and life.

1. *He must be a friend in sympathy*, that is, in capacity to feel with his scholars, which is very different from feeling for them. He must be able in thought and feeling, to put himself in his scholars' place, to see the world through their eyes, and to have an appreciation of their nature.

2. *He must be a friend in helpfulness*.—Not the greatness of our doing for others, but the spirit of it, measures our friendship. By little kindnesses to his class the teacher can win their hearts, and by tying them to himself, tie them to his Master.

V. *The teacher's work is a teaching work, and he must therefore be a teacher*.

1. *He must be a teacher in knowledge*.—He must know his lesson in all its departments and bearings, and with a wealth of

information far greater that he expects to impart to his class; for power in teaching proceeds more from the reserve force of the things known and kept back, than from the things taught.

2. *He must be a teacher in tact*; that is, in wisdom, to know opportunities and skill to use them. Tact is a gift, but it may be cultivated and improved by application. And, "if any of you lack wisdom, let him ask of God, that giveth to all men liberally and upbraideth not, and it shall be given him." James 1:5.

LESSON IV.—THE CANON OF SCRIPTURE.

The English word canon is a literal re-spelling of the Greek word meaning "a straight rod," hence, "a rule or standard." As used in reference to the Bible, it means:

1. The rule or fundamental principle of truth.
2. The catalogue of the books which contain that truth. As there are two testaments, the old and new, it is necessary to notice the canon of each separately, answering the question, "How came the Bible in its present form?"

I. *The Old Testament Canon*.—In the growth of the Old Testament we can trace six stages.

1. *The Oral Period*, extending from the earliest ages down to the time of the patriarchs, during which the Divine Revelation and the records of the past were transmitted by tradition, or in a few detached documents, like Genesis x.

2. *The Mosaic Period* (1500-1400 B. C.) When from ancient manuscripts, tradition and revelation were written the book of Job, and the earliest draft of the Pentateuch, and Joshua.

3. *The Davidic Period* (1100-1000 B. C.), the age of Samuel, David and Solomon, when, after the disorders in the time of the Judges, literature began to flourish anew, and Judges, Ruth, Samuel, the first draft of Psalms and Proverbs, the Song of Solomon, and perhaps (but by no means with certainty) Ecclesiastes were written.

4. *The Prophetic Period* (800-600 B. C.), in the decline of the monarchy, when the prophets suddenly arose to prominence, and the books of Kings and most of the prophetic books were written.

5. *The Period of the Restoration* (500-400 B. C.), after the return from captivity, when the writings of all the four greater prophets were arranged, the prophecies of Haggai, Zachariah, and Malachi were delivered, and the historical books of Chronicles, Ezra, Nehemiah and Esther were written.

6. *The Period of Arrangement* (400-150 B. C.). With the time of Ezra and Nehemiah a new era began. No more books were added, but the literature was systematized. Ezra made the first compilation of the Scriptures; Nehemiah formed a library of the recognized works (according to ancient Jewish history); the work was revised under the early Maccabean

princes, and the writings assumed their present form. Josephus, the historian, names as authoritative the same works that are now recognized.

II. *The New Testament Canon*.—The Old Testament was in process of construction more than ten centuries, the New Testament, less than one; but in it there was also a growth.

1. *The Early Period*.—Between the death of Stephen, A. D. 37, and the council at Jerusalem, A. D. 50, were written the earliest books, the Gospel of Matthew and the Epistle of James.

2. *The Pauline Period*.—Between the council at Jerusalem, A. D. 50, and the destruction of Jerusalem, A. D. 70, appeared the Gospels of Mark and Luke, the Epistles of Peter, the Epistles of Paul and Hebrews.

3. *The Closing Period*, after the destruction of Jerusalem, between 70 and 96 A. D., witnessed the Epistle of Jude, and the Epistles and Gospel of John and the Revelation.

How the systematic canon of New Testament books came to be recognized can not now be ascertained. The matter was probably determined by the inherent fitness of the writings themselves. The worthy books lived, the unworthy dropped out of notice, as may be seen by comparing the New Testament with the New Testament Apocrypha. The councils voiced the sentiment of the church in their decisions; and though there were differences of opinion concerning a few books, extending through the second and third centuries, by A. D. 300 the list of canonical books in the New Testament was generally accepted throughout the church, as it is still held.

III. *The genuineness of the Bible*; that is, the belief that we have the Bible substantially as it was written, without serious interpolation or erasure, is supported by the following evidences (Chautauqua Text-Book No. 18, pp. 26-27):

1. The numerous ancient manuscripts now in existence, which substantially agree in the text.

2. The quotations from Scripture, and references to it, in the writings of the early fathers and in the rabbinical paraphrases.

3. The ancient translations of the Old and New Testaments.

4. The decisions of early and learned councils.

5. The jealousy and watchfulness of opposing sects, all of which base their faith on the same Scriptures.

6. The early controversies between Christians and their enemies, referring to these books as authoritative upon believers.

7. The reverence and scrupulous care of copyists of the Scriptures in all ages.

8. The unimportant character of the "various readings" in the manuscripts, showing that their differences are of trifling account. From these considerations it is certain that our Bible does not essentially differ from the Bible of the primitive church.

EDITOR'S OUTLOOK.

THE HEADQUARTERS OF THE C. L. S. C.

The Chautauqua Circle is unlike all other circles. It possesses three centers. Its intellectual center is the place where the superintendent happens to be at any given moment; for where the king is, there is the court. The center of its enthusiasm, the Mecca of its members, is the Hall of Philosophy, among the beeches of St. Paul's Grove, where once a year the gates are opened, the Arches are garlanded, and the Watch-Fires are kindled. Its business center, which may properly be called the headquarters of the C. L. S. C., is in Plainfield, New Jersey. Few who pass around the corner of a modest brick building near the railway station in that lovely country city, are aware

that they are in the shadow of the walls within which is transacted the business of an organization numbering more than fifty thousand, and extending its arms around the world. Two rooms upon the second floor are all the space at present afforded for the work of the office. There is great need of more enlarged quarters. Its home was assigned when the Circle was about a fourth of its present dimensions, and its business has far outgrown the capacity of its capitol.

One of the two rooms is the place where most of the clerical work of the Circle is carried on by the efficient young secretary and her lady assistants, who number from five to ten at different seasons in the scholastic year. One young lady opens the

letters received, which sometimes number twenty-three hundred in a week, and never fall below eleven hundred, and assort them. Another finds constant employment in answering inquiries, addressing circulars of information, in changing the names and addresses of members who change their residences, or of lady members who get married and change their names. About ten per cent. of these people forget to state to which class they belong, and consequently their names must be hunted up in the different class-registers. [MEM. Whenever you write to the office, *always* mention the graduating year of your class.] Another young lady keeps account of the fees, and writes receipts to those who pay them, and quite frequently finds it necessary to search the big books for the address of a member who has forgotten to tell in what State he lives, and forgotten also that there are twenty-seven towns of that same name in the United States. [MEM. Always be sure to give your postoffice address fully.] A couple more of the staff are busy at certain seasons in filling and addressing the envelopes which are sent three or four times a year to upward of forty thousand people. It requires most of the time of one person to file the letters, postal cards and outline memoranda received from the members, for every scrap of writing sent by members of the C. L. S. C. is duly arranged in its alphabetical place, so that it can be referred to at any minute. The secretary herself sits at a table whereon stands a formidable pile of letters containing questions upon every subject imaginable (beside others unimaginable); outline memoranda to be examined, inquiries concerning seals on diplomas, a labyrinth so intricate that nobody except the secretary has the clue; requests for permission to substitute for the Required Reading Mac-Somebody's history of which nobody else has ever heard the name; and occasionally a letter which warms one's heart, as it tells of the blessing which the C. L. S. C. has brought to a far-away home. No letter remains long unanswered, and no inquiry, however slight, is passed by.

A very careful account is kept with each member of the C. L. S. C., so that quite a history could be written of each student's relation to the office. To each class of the Circle is assigned a large volume, ruled to supply blanks for all the data. In this the names of the members are enrolled in alphabetical order. Opposite each name are recorded the answers upon the application blank; receipts of fees of membership, with dates; receipts of outline memoranda, and a space for report as to the member's final destiny in the C. L. S. C., whether diploma or withdrawal.

The second of the two rooms at the headquarters might be, from its general appearance, either a postoffice or a dove-cote. It is cut up into pigeon holes, which fill it in every part, leaving only narrow aisles for passage. In these boxes are kept the envelopes which represent the members of the C. L. S. C. To every member is assigned a large manilla envelope, upon which is written the name and address; and into that envelope goes every letter received from the said member, with his outline memoranda, and answers to the questions on the application blank. The envelopes are constantly called into use, as letters from the members are frequent; and even after the class which they represent has graduated they are still kept, so that every application, letter, or outline memoranda, from the first day of the Circle's history can be recalled to view. Thus each member can be assured that his name will have a double title to be remembered in the generations to come. In the archives of the C. L. S. C. will be found his enrollment, upon the page of the volume containing the record of his class, and the envelope which bears his name and contains several specimens of his handwriting and signature.

We look forward to a day, it is to be hoped not far distant, when the office work of the C. L. S. C. shall enjoy more ample accommodations. Its growing numbers give increasing work and require larger room, and not long can the headquarters of the C. L. S. C. be kept within their present narrow bounds.

EVANGELISTS.

The term *Evangelist* literally means "publisher of glad tidings." It is met in the book of the Acts of the Apostles and in the writings of Paul, and though from the meager accounts we have of the organization and practical workings of the church in Paul's time it is difficult to determine the precise functions of those to whom it was applied, yet there is general accord in the notion that the Evangelists of the early church were a sort of under-missionaries working under direction of the apostles and preceding the pastors whose business it was to watch over and minister to the local organizations. The position of Evangelist was of great importance and usefulness. The name is bestowed in praise and honor by Paul on one of his most esteemed co-workers.

Although in the literal and best sense every man called to preach the Gospel is an Evangelist in that he is called to proclaim the "glad tidings," yet even in this nineteenth century as well as in the first, there is room and work for the Evangelist as he is conceived in the mind of Paul when he delivers his exhortation to Timothy. So long as there remain, whether within or without the pale of civilization, districts or localities whither the proclamation of "good news" has not come, there is a glorious sphere and mission for the Evangelist.

But not such is our latter-day, nineteenth century Evangelist, as he is commonly seen and known. He is not sent out by and under direction of the apostles, nor does he, as a rule, go in the name of any branch of the organized church. Not unto the heathen or pagan, not even unto the "waste places" where souls are in ignorance, perishing for lack of opportunity to hear the Gospel. No, the "Evangelist" in this age and country is an individual whose call has come in such a way that the organized church is often ignored. He does not precede civilization, but follows it on the railway train—not to the frontier, but to the goodly town or city. Once there, if his preference is consulted, it is not the "ragged portion," with its sin and neglect, but the most popular church with all its auxiliaries of organ, choir, comfortable inquiry room, and the pastor as first subordinate. For gathering a crowd he calls to his aid that valuable assistant, the press. He is a "magnetic" man. He usually brings along with him some marked improvements in methods and theology. The latter sometimes consist in a new and improved definition of conversion, and a short-cut path through the old-fashioned wilderness of repentance. A few weeks of "work," "hundreds of souls," a goodly number of collections for the Evangelist interlarded, and he moves on to the next engagement.

Now that he is gone let us look around and see what he has left behind him. He has made his impression, men say. Yes, and he has left impressions, also. Here is one of them: It is that the regular pastor, to whose zeal and faithfulness the whole work must be indebted if it is to abide and amount to anything, as a servant and workman of the Lord, is very inferior to the stranger who made such a stir during the few weeks of his sojourn. The impression obtains in the church that they need not expect conversions under the regular ministry, but must await the coming of another Evangelist. The result is the lessening of the pastor's influence in his church and community, and the education of the people to expect no more than a "tiding over" of the church till the time of another effort under similar leadership.

But not alone the church is educated to so think and expect, but the education reaches the minister also, and when this is so the result is simply deplorable. Bishop R. S. Foster in a recent address to a conference class has so well and truthfully expressed this result that we give his words: "It has become common in these days to say of preachers, 'this is a revival preacher, and this is not.' There is great harmfulness in the suggestion, for we tend to arrange ourselves around this point: We will be of the revival class, or not of the revival; as if any ministry dare to be anything but a revival ministry; as

if a man could be a minister without this power of the Holy Ghost. We must set out to make ourselves revival preachers, working preachers, that will make sinners feel the power of the truth. And perhaps at this point I may say that it will be well for us to take time and consider the field, for it has become a popular idea for us to supplement our ministry by calling in other people to help us out, by employing evangelists, irresponsibles, running over the land, and burning it to a cinder in many places, asking them to come in and do the work God expects us to do." If any one offers as an objection or protest against the above views the question, "What of Mr. Moody and others of signal success in this field of work?" we answer that when to the name of Moody is added a *few* others the list of their kind is exhausted. So we cite the proverb, "The exception proves the rule."

THE NEW TIME STANDARDS.

One of our humorists has wittily depicted the blank astonishment of ocean voyagers whose watches, "never out of order at home," utterly failed, as their owners journeyed to eastern lands, to keep pace with the flight of time. Each noon as the vessel's officers made their observations and set their chronometers with the advanced meridian reached, found the passengers' "Frodshams" lagging rearward. A matter, however, easily explained. Time is regulated by the sun. Wherever the sun is on a north and south line, or meridian, at that place it is noon, and the time obtained by such an observation (to say nothing of the equation of time) is "local" time. As, then, the vessel moved east, each day it met the sun (or rather the sun reached the meridian) earlier than on the day preceding, and all the watches and clocks had to be put ahead just as many minutes as equaled the number of minutes of longitude made by the vessel. In sailing west, the sun would arrive at the meridian later each day, and time-pieces would be too fast, and would have each day to be correspondingly "turned back."

Of course, the same thing occurs on land. If we travel east our watches become too slow; if west, too fast; and the traveler is constantly occupied comparing his local time with those of the places he visits and of the trains on which he is carried. If in Pittsburgh, he finds western trains running by Columbus time, twelve minutes slower than Pittsburgh; eastern trains *via* Pennsylvania Central R. R., nineteen minutes faster; and eastern trains on the Baltimore and Ohio road fourteen minutes faster—just four standards for one city.

After some fourteen years of discussion among scientists and railroad men, an expedient has been finally adopted by which one clock will exhibit the "time" of the whole world. And it is simply this: Since by the earth's revolution on its axis, any (all) point on the earth's surface passes through 360° every twenty-four hours, or at the rate of 15° each hour, the surface can be divided into twenty-four sections, each 15° of arc, or one hour of time, in breadth, having for its standard time, the time of its (the section's) middle meridian. This makes the difference in time between any two adjacent sections exactly one hour. Thus, if at Greenwich it is noon, from 7½° to 22½° west of Greenwich it is only 11:00 a. m., while in the section included by the meridians 7½° to 22½° east, it is 1:00 p. m. Or, when it is 3:25 p. m. at Greenwich, it is 2:25 and 4:25 p. m. respectively in the sections directly west and east of the Greenwich section; and 1:25 and 5:25 p. m. respectively in the next adjoining sections; and so on. Now applying this principle to our own country, we have the following scheme:

Meridian Standard.	Local time compared with Greenwich time.	Boundaries of Sections.	Name of time.
60° W.	4 hours slow.	52½° to 67½° W.	Eastern.
75° W.	5 " "	67½° to 82½° W.	Atlantic.
90° W.	6 " "	82½° to 97½° W.	Valley or Central.
105° W.	7 " "	97½° to 112½° W.	Mountain.
120° W.	8 " "	112½° to 127½° W.	Pacific.

From which it is readily seen we have but five instead of over fifty standards as heretofore; and that the time of any place can not vary more than thirty minutes from its own local time.

It is proposed that places located between the meridians given in the column headed "Boundaries of Sections," shall adopt the time named in the same line in the next right hand column headed "Name of Time;" for example, places located between the meridians 67½° and 82½° west will adopt "Atlantic" time, which is the local time of the 75th meridian, and is five hours slower than Greenwich and eight minutes 12.09 seconds faster than Washington time. It is not supposed, however, that this will be done as exactly as laid down in the table; for a railroad may be located principally in one section and extend a short distance into another; in which case it would not be worth while to change the standard for the short part. Thus, the Pittsburgh, Cincinnati and St. Louis Railway has its eastern terminus in Pittsburgh, something over 100 miles east of the Central section, in which the main body of the road lies; and this road adopts Central time throughout its whole extent. In like manner, San Antonio and Austin, Texas, are both in the "Mountain" section, but will probably prefer to adopt "Central" time and be respectively thirty-three and thirty-one minutes slower, than to adopt "Mountain" time and be respectively twenty-seven and twenty-nine minutes faster than their local time; and this for the obvious reason that their business connections are much more extensive with the Central than the Mountain region. But these cases do not in the least interfere with the integrity of the general scheme. The minute-hands of all properly regulated time-pieces will always indicate the *same minute*, and all "times" can be estimated by the addition or subtraction of *entire hours*. And in this lies the beauty and simplicity of the device.

With great unanimity the railroads of the United States, and most of the principal cities of the Union have already and without a "jar" adjusted their business to this new basis; and it is to be presumed that as soon as the advantages are fully understood, some cities that are now hesitating will fall into line. The fact is, that while the adoption of the new plan would produce a wonderful uniformity, there would be a few cases in which the disturbance of local time seems great; but it is not any greater than in hundreds of cases where the old method is used. To exhibit the changes we give a few samples: In New Orleans the time is fourteen seconds slower than local time; in St. Louis, forty-nine seconds slower; in Denver, no difference; in Philadelphia, 38.45 seconds slower; in New York, three minutes 58.38 seconds faster; in Baltimore, six minutes slower; in Washington City, eight minutes twelve seconds slower; while in Kansas City the time is eighteen minutes 21.7 seconds slower; in Pittsburgh, twenty minutes three seconds faster; in Cincinnati, twenty-two minutes 18.58 seconds faster; and in Omaha, twenty-four minutes slower than the respective local times.

RESULTS.

By the new system, railroad towns would have a great advantage in that they could obtain their time with greater precision from the railroad clocks, which are regulated by signals from astronomical observatories. Inland towns having no observatories or telegraphs would of course, as they do now, obtain their time as best they could from adjoining cities.

In some places there would still have to be two standards, as in railroad centers; but there never need be more than two, and as these two will always be exactly one hour apart, the adjustment of working hours, business hours, school hours, etc., is a problem involving nothing more than the addition or subtraction of an hour.

The Geodetic Congress which met in Rome a few weeks since, and in which the United States was officially represented by General Cutts, of the Coast Survey, passed, unanimously, resolutions urging the adoption of this system for the whole world, with the meridian of Greenwich, as it always has been

and is now for all nautical calculations, the universal standard. A compliance with this recommendation would reduce, with our present time-pieces, the time of the world to twelve standards (our watches and clocks merely repeating themselves after crossing the 180th meridian), and enable a man to "circumnavigate the globe," and always have correct time without once changing the minute-hand of his watch.

PERE HYACINTHE.

This distinguished orator is again visiting our shores, and very many will avail themselves of the opportunity to listen to his almost peerless eloquence. His mission this time is to raise money, by means of lectures and appeals to the benevolent, for the work in which he is engaged in Paris. A glance just now at this man's remarkable career will be timely.

Father Hyacinthe's real name is Charles Loyson. He was born in Orleans, France, March 10, 1827, and is therefore now nearly fifty-seven years of age. He showed in boyhood some precocity, writing verses which were regarded remarkable for his years. For some years he was a student at the academy of Pau, which institution he left at the age of eighteen to become a student of theology in the school of St. Sulpice. After receiving priest's orders, he taught philosophy for a time at Avignon and theology at Nantes; then for ten years he was in charge of the parish of St. Sulpice. He was past thirty when he entered the convent of the Carmelites at Lyons as a novice. Two years after he became a member of the order, and began preaching in the lyceum at Lyons. He soon acquired great popularity here; and on visiting Bordeaux, Perigueux, and Paris, and giving courses of sermons in these several places, he made a wide and deep impression. It was about 1867 that the liberality of some of Father Hyacinthe's sentiments attracted notice. His orthodoxy became suspected, but his popularity continued to grow. We see him, in 1869, examined by the pope as to his doctrines, whom he seems to have convinced of

his substantial soundness. A little later, however, a great sensation was produced by some of his liberal utterances. The general of the order of Carmelites at Rome warned him that he must change his tone or cease from preaching. His reply to this order was so outspoken against certain practices of the church as to draw from Rome a threat of the major excommunication. He had been preaching in the church of Notre Dame, Paris, and was now prohibited from doing so longer.

It was soon after the opening of the breach between himself and the authorities of his church, in the autumn of 1869, that the great preacher made his first visit to America. His fame had preceded him, and by Protestants he was warmly welcomed. His stay was short, but those permitted to hear him in his few public addresses were ready to admit that his reputation was not amiss as one of the most consummate orators of modern times. The breach with Rome became wider. In 1870 the Pope released him from his monastic vows, and he has since been a secular priest. He earnestly protested against the dogma of papal infallibility proclaimed by the council of that year, and cast his lot for a time with the Old Catholics, headed by Döllinger. He soon chose for himself, however, an independent basis of action. Having, in public address, defended the right of the clergy to marry, he himself married an American lady in 1873, and is now the father of interesting children. His work latterly has been that of an independent preacher in the city of Paris. Like most independent movements, his own has not been a success. In breaking with Rome, he chose not to ally himself with Protestant Christians, and found himself unable to go with Old Catholics. He stands by himself, claiming to be a Catholic, but not a Papist. Of his perfect sincerity those who know him entertain no doubt; but the regret has doubtless been felt by very many that he could not have seen his way clear to devote his brilliant gifts to the cause of Protestant Christianity. The fame of his captivating oratory will long live; but he, perhaps, missed his opportunity to do a great work for the cause of truth in the earth.

EDITOR'S NOTE-BOOK.

THE CHAUTAUQUAN has steadily grown in favor with the public from the time it was first issued. Our old subscribers continue with us, and new ones are being added to the list daily. We are now printing thirty-five thousand copies every month. This circulation is evidence in itself of the rapid growth of the C. L. S. C., and of an increasing demand among reading people for substantial literature. The future of THE CHAUTAUQUAN and the whole Chautauqua movement has never been so full of promise to those who are directing the work as it now is, as we enter the year 1884.

Sojourner Truth is dead. For more than half a century she has been a conspicuous figure, a negro woman, firmly advocating abolition and woman suffrage. Her musical bass voice was often used with tremendous effect in assemblies where she spoke for her favorite cause. Redeemed from slavery herself, she saw her children sold into bondage, but she lived to speak on the same platform with Garrison and Wendell Phillips for her cause, and at last to see her race enjoying freedom.

Two great religious celebrations marked the month of November. The anniversary of Martin Luther was observed by church people in all parts of the land, sermons and lectures made the air vocal with the praises of Luther and his deeds in behalf of spiritual Christianity. Our national Thanksgiving day was generally kept by a suspension of business, the hold-

ing of religious services, family gatherings and feasting. The observance of these two days indicates how strong a hold Christianity has upon the American people. Though God is not recognized in the Constitution of the United States, he is honored in a more practical way by being worshiped at the altars of his church, and in the hearts of his people.

Miss Frances E. Willard shows a degree of enterprise unequaled, in the naming of objects, when in her article elsewhere in this number she proposes to change the name of the world. She pays a fine compliment to the Pacific coast as a land of many charms, not the least of which are its elegant homes.

Lewis Miller, Esq., president of the Chautauqua Assembly and the C. L. S. C., has rendered an invaluable service to the Assembly by his wise counsel and unceasing labors ever since the death of Mr. A. K. Warren, last summer. It is expected that the trustees will elect a secretary to succeed Mr. Warren at their meeting in January.

In the fall elections the Republicans defeated General Butler in Massachusetts, retrieved themselves in Pennsylvania, and elected part of their ticket in New York State, in the face of nearly 200,000 majority against them one year ago, but in Ohio they lost the control of the State government, and in Virginia the Mahone party received a terrible reverse. The immediate

effect of these changes is, new hope springs up in the hearts of the Republican leaders that they shall be able to elect the next President.

The contest for the election of Speaker of the House of Representatives presented this new phase of politics in the Democratic party: There was a Northern faction which supported Mr. Randall, of Pennsylvania, and a Southern faction, which proved to be the stronger of the two, which elected Mr. Carlisle, of Kentucky. In the history of this nation a great party has been hopelessly divided by a cause of less import than is seen in this contest for the Speakership.

The tariff may come into prominence as a great political issue in the Presidential contest of 1884, and it may be kept out of the battle entirely. The Democratic party has the power to choose the battle ground, and to say over what issue the voters shall wage the war.

The divorce laws of the states are so diversified and are working so much mischief to the family and society, that it would be a safe and easy way out of our troubles if our National Congress would give us a wholesome law on divorce. Eminent lawyers say "there is no principle in the Constitution to prevent it." It would be in the interest of the whole people—and guard the family, which is the very foundation of national life. A copyright law or a bankrupt law are no more national than a divorce law would be.

The lace industry is a most valuable business in France. We know little about it, only as the article is used for decorating the persons and homes of the American people. To Culbert, the protectionist, the rise and growth of this business may be traced. Two hundred and fifty thousand people in France are engaged in its manufacture, and its products are valued at about \$20,000,000 annually. Here is an opening for enterprising American capitalists who are seeking places to invest their money, and as a branch of manufacturing in this country, it would be an opportunity for thousands of needy women to find remunerative and agreeable employment.

It is reported in literary circles that "Anthony Trollope was excluded from *Good Words* (a London religious magazine) because he introduced a dance into a story." If this be true, it shows the sentiment of religious society in England on the dance; to say the least, it is strong evidence that the editor of *Good Words* knows what would offend the taste of his readers, and has the courage to exclude it from his columns.

"The Boston School Committee has tried the experiment of industrial training for about two years on a small scale among the boys in the Dwight school building. About five hours per week have been devoted to mechanical work. The boys have been taught the proper use of tools, and many of the lads have shown such proficiency and have made such rapid progress in this new branch of education that it has been decided to make it a permanent feature of the Boston schools for boys. The subject was brought up in November at a meeting of the School Board, and was favorably considered. The Superintendent of Schools, Professor Seaver, said the objection had been raised that too much time might be taken from other studies. His belief was that, if necessary, it would be better to abandon some other studies and give more time to one that was calculated to give the boys some information of practical value—one that would enable them to become useful members of society early in life, rather than ornamental boys. It was finally voted to request the City Council to appropriate \$2,500 for the equipment and maintenance of a manual training school in the basement of the Latin school building. It is the intention to devote ten hours per week to the new system."

The average daily movement of the wind on the top of Mount Washington in October last was 619 miles; highest tem-

perature 54° 5'; lowest, 6°. The highest velocity of the wind was 94 miles an hour, from the west. There were three inches of snow on the summit at the close of October.

With the introduction of the electric light into the streets of our towns and cities, we meet a new danger from broken wires, charged with electricity, hanging in the air. In New York City, last month, an electric light pole was broken and the wires fell to the ground, when a runaway horse had a strange experience. An officer at Mr. Bergh's office said: "We had no occasion to use the ambulance. The horse seemed to have become entangled in the wires after falling and to have become so charged with electricity that it was unable to get up. The driver received a shock from the horse's body in attempting to lift it, and was thrown violently to the ground. I understood that several others who attempted to help the horse had the same experience. Word was finally sent to the Brush supply office in Twenty-fifth street, and I understood the electricity was cut off from the circuit while the horse was released. The animal was able to walk, and was taken to the stables. I am told that even the harness was so charged with electricity that it was dangerous to touch it." The people must be educated to keep hands off these wires, or what would be a better plan, all companies should be obliged to lay their wires under ground.

A Law and Order League has been organized in St. Louis for the purpose of securing to the city an honest local government.

"The traveler along the highway a mile or so above the village of North Haverhill, N. H., finds," says *The Boston Journal*, "a small graveyard which contains the remains of brave McIntosh, the leader of the Boston Tea Party. For seventy years spring flowers have blossomed and winter winds have blown over a grave unmarked by stone and known to but a few aged people now living who remember his burial. He fills a pauper's grave, having died in the vicinity of 1810 or 1811, at the house of a Mr. Hurlburt, who resided at what is now known as the Poor Farm, and to whose care he had been bid off as a public pauper by public auction as the lowest bidder, according to ye ancient custom, and as recorded upon the town records. That he was the leader without a doubt there is abundant proof, and that to his memory should be erected a suitable monument commemorative of the man and deed would be simple justice."

The unusual fact is reported that in Chicago the wife of the bookkeeper in a National Bank, on discovering recently that her husband was dishonest, went to the president and told him of the fact. In noticing this remarkable circumstance the *Inter-Ocean* says: "Although hundreds of women hold positions of financial trust in Chicago and elsewhere in the country, we have yet to hear of one of them being guilty of embezzlement or defalcation." The same is true, almost or quite without exception, of the female employes of the government, and their superior skill in counting and handling money has been attested by General Spinner. They are not only more expert in this, but they are sharper eyed than the men. A counterfeit can seldom pass their scrutiny undetected. Indeed, they seem to have a sort of clairvoyance for fraud. Yet some Congressmen, who are chiefly anxious to wield patronage to reward their constituents, favor the exclusion of women from clerkships. They are not merely ungallant, but opposed to faithfulness and economy in the public service.

The great cantilever bridge just completed over Niagara River has been constructed for a double railroad track. It is about three hundred feet above the old railroad suspension bridge, spanning a chasm eight hundred and seventy feet wide between the bluffs, and over two hundred feet deep.

In the Chautauqua School of Theology the reports from departments show a large increase of students for the past month.

The total number now enrolled is as follows: Hebrew, 38; Greek, 132; Doctrinal Theology, 85; Practical Theology, 116; Historical Theology, 25.

The Hon. James G. Blaine excited considerable discussion in the political world during the past month by a letter he published in the *Philadelphia Press*. He objects to distributing the surplus revenue collected by the government among the States, but believes that the income from the tax on distilled spirits might be so divided. This places both Mr. Blaine and the government in an unenviable position. It is blood-money—yes—blood-money. Like the money Judas received for betraying Jesus Christ into the hands of his enemies, so the tax on rum is the price the government has received for betraying innocent wives and children and weak men into the hands of their enemies. Mr. Blaine is a pronounced prohibitionist, and as such he would do well to have as little as possible to do with the tax on rum. It is a dangerous question to handle, in any but one way, and that is for the government to abolish this particular tax by prohibiting the traffic in spirituous liquors.

Any one west of the Mississippi desiring a class badge of '85 can procure it of the Secretary, Mamie M. Schenck, Osage City, Kansas, by sending the sum of ten (10, cents).

Every one in the northeastern States remembers the brilliant sunsets that occurred in the latter part of November. The persistent, intense, red light that streamed up the sky almost to the zenith, was so unusual a phenomenon that many theories have been given in explanation. Of course the first was that of unusual refraction produced by differences of density in the atmosphere; but as the light was observed so far, so long, and before sunrise as well as after sunset, another explanation seems necessary. Prof. Brooks, of western New York, has advanced a reasonable explanation in the suggestion that it was caused by reflection from clouds of meteoric dust in the upper portion of the atmosphere. In confirmation of this, Prof. Brooks claims to have discovered, on the night of November 28, a shower of telescopic meteors near the place in the sky where the sun had set.

The annual report from the United States Mint shows that the total amount of gold and silver received and worked during the year was \$87,758,154, of which \$49,145,559 was gold and \$38,612,595 was silver. The coinage consisted of 98,666,624 pieces, worth \$66,200,705. Of this amount \$28,111,119 was in standard silver dollars. The total amount of fractional silver

in the country is \$235,000,000. The earnings of the mints during the year were \$5,215,509, and the expenses \$1,726,285. The total value of the gold and silver wasted at the four coining mints was \$30,084, while there was a gain from surplus bullion recovered amounting to \$62,658. The director estimates the total coin circulation of the United States, on July 1, 1883, at \$765,000,000, of which \$537,000,000 was gold and \$228,000,000 silver. The estimate on October 1, 1883, was \$544,512,699 of gold, and \$235,291,623 of silver.

The "Children's Aid Society" of New York City held its annual meeting in the American Exchange Bank, in December. It could appropriately be called a society for "diminishing crime and vice," because that is just what the Society is doing among neglected and wicked children. The secretary said: "There were during the past year, in our six lodging houses, 13,717 different boys and girls; 297,399 meals and 231,245 lodgings were supplied. In the twenty-one day and fourteen evening schools were 14,132 children, who were taught, and partly fed and clothed; 3,449 were sent to homes, mainly in the West; 1,599 were aided with food, medicine, etc., through the 'Sick Children's Mission'; 4,140 children enjoyed the benefits of the 'Summer Home' at Bath, L. I. (averaging about 300 per week); 489 girls have been instructed in the use of the sewing machine in the Girls' Lodging House and in the industrial schools; \$10,136.12 has been deposited in the Penny Savings Banks. Total number under charge of the Society during the year, 37,037. The treasurer, George S. Coe, reports that \$251,713.94 was received and \$255,865 paid out."

Any person owning a complete set of *THE CHAUTAUQUAN* for 1880-1881, with which they are willing to part, may dispose of the same at our office. We will send for the first volume of *THE CHAUTAUQUAN* the fourth volume, or will pay the original price, \$1.50.

The holiday season will bring a brief respite from study, to members of the C. L. S. C. as it does to students in colleges and universities, and indeed we may say, as it does to business and professional men, and everybody. It is a time of good cheer, of merry-making and rejoicing, for Christmas-tide is the most joyful of all our holiday seasons in the suggestions of the day itself, and in the freedom and intensity of feeling with which it is observed. It marks the end of the old year with an exclamation point, and we bow it out with a shout of joy. As the year 1884 comes in, to our scores of thousands of readers we say, *A Happy New Year to you all.*

C. L. S. C. NOTES ON REQUIRED READINGS FOR JANUARY.

PHILOSOPHY OF THE PLAN OF SALVATION.

P. 26.—"Benignus," be-nig'nus. The benign; generous.

"Contumax," con-tu'max. The rebellious; stubborn.

P. 29.—"Theomisey," the-om'is-ey. The author has coined the term from the Greek words for "God" and "Hate," and it means a hatred of God.

P. 32.—"Factitious," fak-tish'us. Factitious ideas are those which have been formed by the thinker, and are opposed to those which are simple and natural; conventional, artificial.

P. 37.—"Criterion," cri-te'ri-on. A rule or test by which actions, facts and judgments are tried.

P. 38.—"Scythians." The inhabitants of Scythia, a country whose borders were never distinctly defined. As described by Herodotus it included parts of eastern Europe and western Asia, its southern bound-

ary being a portion of the Black Sea. Scythia was afterward the name given to a section of Asia north of the Oxus.

"Northmen." The Scandinavian tribes, or the Swedes, Danes and Norwegians.

P. 39.—"Pope." (1688-1744.) An English poet. From early boyhood he was a student and writer. At thirteen he began a course of self-education, and at twelve wrote his "Ode to Solitude." The "Pastorals," his first published work, placed him at twenty-one among the first poets of his time, and introduced him to literary circles. In 1711 his "Essay on Criticism" appeared, and soon after the "Rape of the Lock." Pope's translation of the *Iliad* was the first of his works which was a financial success. In 1725 he edited an edition of Shakspeare, and in 1728 produced "The Dunciad," an attack on various contemporaneous scribblers. Of his other writings the "Moral Essays" are best known.

Pope was never married. He was a little, weakly man, critical, narrow, vain, and often untruthful, but withal generous, clear-minded, and true to his friends.

P. 40.—“Fane.” A place dedicated to some deity; hence a place dedicated for worship.

P. 41.—“Republic.” A work of Plato's, in which he sets forth his ideas of an ideal commonwealth. It treats of both Church and State, but is impracticable for the existing conditions of society.

P. 42.—“Petronius,” pe-tro’ni-us. The period at which he lived is uncertain, but he probably belonged to the age of the Emperor Nero. (A. D. 37-68.) The work here quoted describes the adventures of several young and dissipated men in southern Italy. Only fragments of it remain.

P. 42.—“Seneca.” See C. L. S. C. Notes in THE CHAUTAUQUAN for November.

P. 43.—“Bengal,” ben-gawl’. One of the ten political provinces of India. It is in the extreme east of the peninsula, and includes the regions lying about the mouth of the Ganges and Bramapootra rivers, and the adjacent hill regions.

“Medhurst.” (1796-1857.) An English missionary who spent most of his life in Java and China. Of the latter country and its people he wrote much. He translated the Bible into Chinese, beside publishing the “Chinese Repository,” a “Chinese and English Dictionary,” etc. “China, its Fate and Prospects” is still a book of high authority.

“Buddha,” bööd’da. The name not of a particular teacher, but of a class of deified teachers among the Buddhists. Great numbers of them have appeared at different times as saviors of the race. The Buddha of the present period is called Sakyamuni.

“Kalé,” ka’lee. The name of one of the many forms of *Doorga* a terrible goddess, so popularly and variously worshiped in Hindoostan. The goddess assumed the name Kalé on the occasion of a battle with a thousand-headed giant-demigod whom she slew. Her most common image is that of a black, or very dark colored woman, with four arms, the upper left arm holding a cimeter, the lower left a human head by the hair. Around her waist as a covering she wears a string of bloody human hands, with an immense necklace of human skulls reaching below the knees. Kalé is a female *Satan*, a most sanguinary goddess, and as terrible as anything the imagination can picture. The ceremonies of her worship require the sacrifice of animals and human beings, and are in keeping with the terrible character they adore.

P. 44.—“Apotheosis,” a-po-the’o-sis. To place among the gods; to deify.

P. 46.—“Numa.” The first king of the Romans. His time is uncertain. He was selected from among the Sabines, after the death of Romulus, and introduced many valuable institutions and laws.

“Augustan Age.” That period in which the Roman mind reached its highest point of culture and activity. Cicero, Ovid, Virgil, Horace, and many others adorned this period. It was called Augustan from Augustus Caesar, the reigning emperor.

“Jahn,” Otto. (1813-1869.) A German philologist. He studied in the best schools of Europe and held professorships in various universities. He was very liberal in his views, and became famous as an archæologist and philologist. Among his works are editions of Latin classics, a life of Mozart, essays on art, and various miscellaneous papers.

P. 47.—“Allegories.” That is, that the teachings concerning the gods were figurative stories, explaining the facts of human nature and the mysteries of the external world.

“Dionysius.” See Notes in THE CHAUTAUQUAN for October.

“Tholuck,” to’look. Friedrich August Gottreu. (1799-1877.) A German theologian, educated in Berlin, and afterward a professor there. He was transferred to Halle in 1826, where he spent the rest of his life. An eminent Christian, his doctrine at first met with opposition from the rationalism of the university, but changed the views of the majority of the faculty. He left eleven volumes on theology and philosophy.

P. 50.—“Chaotic,” ka-ot’ic. Confused, disordered; like chaos.

P. 53.—“Consanguinity,” kón’san-gwín’i-ty.

P. 56.—“Attrition,” at-trish’un. Wearing away, produced by constant friction.

P. 57.—“Conservator,” con’ser-va’tor. A keeper, preserver.

“Tabularasa.” A blank tablet.

“Concatenation,” con-cât’e-ná’tion. A series of connected events, depending upon one another.

P. 62.—“Concomitant,” con-com’i-tant. A companion; a person or thing connected with another.

“Swedenborg.” (1688-1772.) A native of Sweden educated at Upsal. For several years after leaving the university he was engaged in literary work. Having been appointed Assessor of the College of Mines he assisted the king, Charles XII., in his military operations, until after the death of the latter. His life was spent in scientific pursuits until 1745, when he claimed to have been called of God to reveal a new system of truth. The remainder of his life was spent in work upon the books which explained this system. Briefly, he claimed: One God, revealed to man through Christ; a trinity of principles, not persons; a redemption produced not by vicarious suffering, but by the conquest of the powers of hell; this victory restored to man his spiritual freedom, and gave him an opportunity to work out his salvation; the necessary features of religion are faith and an avoidance of sin. He claimed to reveal a new church—the New Jerusalem of Rev. xxiii—and his followers call themselves members of the “New Jerusalem.” His teachings concerning the future world are to be found in “Heaven and Hell,” and his theology is explained in “True Christian Religion.” Swedenborg claimed his writings to have been revealed in communications with the spirit world, and to the last affirmed his own honesty.

“Irvine,” Edward. (1792-1834.) A Scottish minister educated at Edinburgh, and in 1822 ordained to preach. Having been called to a small church in London he soon attracted, by his eloquence, an immense congregation of the nobility, the learned, and famous. Soon a new church was built for him. In 1825 he began to preach the second advent of Christ as a near event, and also to teach that the nature of Christ was one with ours, even in its infirmities and liabilities to sin, a doctrine which led to much controversy. In 1830 it was reported that supernatural phenomena were taking place in parts of Scotland. Irvine became convinced that the manifestations were divine. Soon after they appeared in his congregation and he published an account of them in Fraser’s Magazine. As a result he lost his popularity, was driven from his church, and set aside by the Scottish presbytery. Irvine’s followers obtained a place of worship and established what is now known as the Catholic Apostolic Church. Irvine claimed to have received ordination from the spirit to preach to this body, and was made bishop a position he held until his death.

“Elymas,” el’y-mas. See Acts xiii; 6-7-8.

“Smith,” Joseph. (1805-1844.) The founder of the Mormons. He first attracted attention by his “Book of the Mormons,” which he pretended to have discovered and translated under angelic guidance. He founded a church at Manchester, N. Y., which was soon moved to Kirtland, Ohio, thence to Missouri, where the conduct of the leaders so incensed the public that they were driven from the country. Smith next located his band in Illinois, but attempting to introduce polygamy as a revealed doctrine, the outraged inhabitants revolted, and in the raid Smith was killed.

P. 67.—“Beelzebub.” The name of the supreme god among all the Syro-Phœnician peoples was Baal, i. e., lord, or owner; and by adding to it *zebub*, insect, the proper name Baalzebub was formed; the fly-god, the avener of insects.

P. 68.—“Typhon.” In Egyptian mythology Typhon (or Set) was the manifestation of the abstract principle of evil, and at first equally honored with Osiris, the principle of good. Afterward he became the god of sin, and so was at war with Osiris, and an enemy of men. It is said that in the tenth dynasty the priesthood, fearing that Typhon was going to conquer in the conquest between good and evil, obtained a royal decree, ratified by sacerdotal order, to banish him out of Egypt.

“Serapis,” ser-a’pis. The worship of Serapis prevailed in the time of the Ptolemies. It is fabled that in the contest of Typhon and Osiris the latter was slain. He returned to earth in a second existence as the god Serapis. The name is thought to be a compound of Osiris and Apis, the soul of the former having entered the body of the bull. The worship of Serapis continued in Egypt long after the Christian era, and was even introduced into Italy.

P. 69.—“Isis.” Isis and Osiris were the only gods worshiped by all the Egyptians. Isis was represented as the wife of Osiris, and with him

one of the great benefactors of the people, he having introduced the plow, and she having taught them how to cultivate grain. As the Greeks influenced somewhat the religion of Egypt, she became the goddess of the moon. The worship of Isis was introduced into Italy in the first century, A. D., and a fine temple built to her at Rome. The ruins of a temple of Isis have been unearthed at Pompeii. In works of art she is represented with the face of Juno, wearing a long tunic, a lotus flower on her head, and in her hand the peculiar Egyptian musical instrument called the sistrum.

"Osiris," o-si'ris. The husband of Isis. He was called "the king of life," "the king of gods," and "ruler of eternity." He introduced civilization among the Egyptians and traveled through many countries, helping the people. He was murdered by Typhon, his brother, and his body thrown into the river Nile. He is represented as having a human form, and always the head of a man. He is colored green, as the god of vivification. His sacred symbols are the evergreen, the tamarisk, and a sort of Ibis with two long plumes at the back of the head.

P. 89.—"Succinctly," suc-sinct'ly. Briefly, concisely.

P. 99.—"Periphrasis," pe-riph'ra-sis. A periphrase; several words used to express an idea; a circumlocution.

P. 107.—"Holocaust," hól'o-caust. A burnt offering, the whole of which was consumed by fire.

P. 138.—"Poarch." The disciples of the poarch were the stoics, or followers of Zeno. See notes in THE CHAUTAUQUAN for November.

"Academy." The disciples of Plato, who taught in a garden near the academy.

P. 149.—"Tacitus." See notes in THE CHAUTAUQUAN for October.

"Pliny." See notes in THE CHAUTAUQUAN for November.

P. 148.—"Dulia," dú'li-a. The word comes from the Greek word for slave, and is applied to the worship of an inferior being, as of the saints.

"Juggernaut," jág'ger-naut'. Meaning in Hindoo the lord of the world. One of the most popular of Hindoo idols. His temple is at a town on the Bay of Bengal, and the shrine is considered the most holy in Hindostan. At least one million of people visit there every year. The temple contains several idols. The great festival of Juggernaut occurs in March of each year. The idol is taken from the temple on a ponderous wheeled platform, and is drawn by a crowd of men and women. It is said that votaries in their excitement have cast themselves under the wheels and been crushed, but this has not occurred for several years.

NOTES ON REQUIRED READINGS IN "THE CHAUTAUQUAN."

GERMAN HISTORY.

P. 189, c. 1.—"Charlemagne." After the death of Charlemagne, 814, the kingdom fell to his son Louis. In 843 it was divided between the three sons of the latter. The kingdom remained with the Carolingian house until 911, when the dynasty became extinct. The entire country was divided into many territories or states ruled by dukes, and the election of the king was given to them. After the death of the last of the Carolingians the electors chose Conrad I., a Franconian, after whom the Saxons held the throne until 1024. The Franconians succeeded, ruling until 1125, when the Hohenstaufen dynasty began. This latter ended with the death of Conrad IV., in 1254.

"Interregnum." The first meaning of the word is the time between the death of one king and the accession of his successor; hence a time in which the execution of the government is suspended. Here it refers to an extended period between the death of Conrad IV., 1254, and the rise of the house of Hapsburg. Rudolph I. was the first of this line, and was chosen in 1273, but the house did not become strong until about the time of the Reformation, after which time until the death of the empire, in 1806, it was almost stationary on the throne.

"Dark Ages." In the broadest sense the term "dark ages" refers to a period extending from the fifth century to about the middle of the fifteenth, in which the intellectual activity of Europe was at its lowest point, and corresponding almost to the middle ages. As used here, however, "dark ages" refers to a period in the literary life of Germany, particularly in the thirteenth and fourteenth centuries. After the time of the Minnesänger and the poets of chivalry there followed nearly two hundred years of great decay in literature. Hallam in his "Literary History," quotes Herren as saying that the thirteenth century was one of the most unfruitful for the study of ancient literature, and Leibnitz as declaring that the tenth century was a golden age of learning compared with the thirteenth; and says himself: "The fourteenth century was not in the slightest degree superior to the preceding age."

"Huss." (1273-1415.) Born at Hussintz, near the border of Bavaria, and educated at Prague, where he afterward became a professor. Having been installed as a preacher he began to declare against the vices of the clergy and the extravagant expenditures in ornamenting the churches. Huss had been made rector of the university, and his bold speech brought about a war between the archbishop of the cathedral at Prague, and the university. The archbishop had burned the writings of Wickliffe, and Huss declared against the act, using such strong arguments that the former was condemned. The charge of heresy was soon after raised against Huss; he was condemned and ordered to leave Prague. He did not remain away long, but was brought back by his zealous partisans. His doctrines, however, again brought down the papal wrath, and he was pronounced a heretic. He continued to preach and write until summoned in 1414 to a general council at Constance.

After a long delay the council condemned him as a heretic, and he was burned at the stake. D'Aubigne says in his "History of the Reformation," "He seemed to enter more deeply than all who had gone before him into the essence of Christian truth. But he attacked rather the lives of the clergy than the errors of the church. And yet he was, if we may be allowed the expression, the John the Baptist of the Reformation. The flames of his martyrdom kindled a fire which shed an extensive light in the midst of the general gloom, and was destined not to be speedily extinguished."

"Henry IV." His father, Henry III., died when the boy was but five years old. His mother was not strong enough to hold in order the nobles of the kingdom, and when Henry was thirteen years old, the regency was seized by an archbishop. After Henry's trouble with the pope, here related, he returned to Germany to find that a new king, called the priest's king, had been elected. Henry immediately appointed a new pope, and began war against Rudolph, the new king. Having defeated him he went to Italy, besieged Rome, and after three years took the city and was crowned emperor. His triumph was short, for his sons soon after rebelled, and Heinrich called his father to sign his own abdication. The old king soon after died in great poverty.

P. 189, c. 2.—"Simony," sim'o-ny. The term is derived from the proper name Simon, who wished to buy the power of the Holy Ghost, (Acts, vii.,) and is applied to the practice of buying ecclesiastical preferment, and of raising parties to church positions for reward.

"Worms," wurmz. A city of Hesse on the Rhine. It is one of the oldest of German cities, and was the scene of the Nibelungenlied. Many diets of the empire were held there.

"Mayence," ma'yangs. The French for Mentz. A city of Germany on the left bank of the Rhine, near its conjunction with the Main. It has been an important city since the time of the Romans. Gutenberg was born and died there.

"Augsburg," owgs'burg. A city of Bavaria, first established by Augustus in the first century. For several centuries it was free, and a most important commercial center.

P. 190, c. 1.—"Canossa," ca-nos'sa. A town in the northeastern part of Italy.

"Parma." See THE CHAUTAUQUAN for December.

"Holy Feme." These tribunals rose in the twelfth century and disappeared in the sixteenth. Sir Walter Scott, in "Anne of Geierstein," has given an account of the Westphalian Fehmgericht, as it was called.

"Westphalia," west-phá'li-a. A western province of Prussia, bordering on Holland.

"Dortmund," dort'móont. A town of Prussia in the province of Westphalia.

"Hildebrand," híl'de-brand. (1018?-1085.) Pope Gregory VII. He was educated in a monastery and became a monk. Having been

made prior of the abbey of St. Paul, he reformed many abuses and became prominent in the church. He at first refused the office of pope, but was compelled to accept. He immediately, on taking the position, instituted strong measures against simony and the licentiousness of the clergy. He summoned Henry to Rome to answer for his conduct, when there followed the trouble already related. Just before the capture of Rome the pope fled. Although Robert Guiscard soon after triumphed over his (the pope's) enemies, his health was broken, and he retired to Salerno, where he died. His last words are said to have been: "I have loved righteousness and hated wickedness, therefore do I die in exile."

"Peter the Lombard." (1100?-1160.) An Italian theologian. He was a pupil of Abè, and the tutor to the son of the king of France. He afterward became a professor in the university of Paris, and bishop of the city. His greatest work was a collection of passages from the church fathers on doctrinal points. This is still in repute.

"Seven Sacraments." The seven sacraments of both the Latin and Greek Churches are: Baptism, confirmation, penance, the eucharist, extreme unction, order or ordination, and matrimony.

"Eugene IV." (1383-1447.) Pope from 1431 until his death. During this period two important councils were held; that of Basel, in which there were efforts made to heal the Hussite schism, reform the clergy, and bring about a union between the eastern and western churches and the council of Florence. Eugene's term was embittered by civil wars and the outbreaks of numerous enemies.

"Transubstantiation." The Roman Catholic Church believes the bread and the wine used in the eucharist to be converted into the body and blood of Christ.

"Lateran," lat'e-ran. In the Lateran Church at Rome have been held eleven important historical councils. The fourth, at which this doctrine was proclaimed, occurred in November, 1215, and is said to have been "the most important ecclesiastical council ever convened."

"Auricular," au-ric'u-lar. Literally, told in the ear.

P. 190, c. 2.—"Council of Trent." The nineteenth œcumenical council was caused by Luther's doctrines. It began in 1545, and after twenty-five public sessions, adjourned in 1563. The chief results of the council were: Tradition was declared to be equally with the Bible a standard of faith; the Catholic doctrines of sin, justification and the sacraments were defined; and the doctrines of extreme unction, ordination, celibacy, marriage, purgatory, relics, indulgences, etc., were promulgated.

"Gutenberg," goo'ten-bérg. (1400-1468.) The partnership between Faust and Gutenberg was closed in five years (1455) because Gutenberg failed to pay the money advanced. After this Gutenberg carried on a printing house alone until, in 1465, he entered the services of Adolphus of Nassau, as a gentleman of court.

"Faust," fowst. He was a rich goldsmith, and probably had nothing to do with the invention of printing. The books produced by this firm were an indulgence, "An appeal to Christendom against the Turks," and a celebrated Latin Bible called the Mazarin Bible. After the dissolution of this firm Schœffer and Faust carried on the business.

"Schœffer, shô'fer.

P. 191, c. 1.—"Schwartz," shwartz. His true name was Aucklitz, but his fondness for magic, called the *black art*, led to his surname of Schwartz, which in German means black. It is considered by many that Schwartz applied the use of gunpowder to war and the chase, as its composition was supposed to have been known before his time.

"Agincourt," a'zhîn-koor. A town on the road from Calais to Paris, where, in 1415, Henry V., of England, defeated the French army. See "Pictures from English History," in THE CHAUTAUQUAN for June, 1883.

"Eisleben," is'la-ben. A town of Saxony of some 13,000 inhabitants. It is interesting as the place where Luther was born and died. The house in which he died still stands.

"St. Martin's Day." The day appropriated to St. Martin in the saints' calendar. He was a pope of the Catholic Church in the seventh century. As he opposed the spread of the doctrine of Monothelitism, or the doctrine that Christ had but one will in his two natures, and, as well, opposed the edict of the ruling emperor, which forbade all discussion on this subject, he was stripped of his clerical honors and banished. He is honored as a martyr.

"Raphael," rāf'a-el. (1483-1520.) The most famous of Italian painters.

"Copernicus," ko-per'ni-kūs. (1473-1543.) He first studied medicine and afterward spent some time in Italy, studying astronomy, where he also taught mathematics. In 1503 he returned to Prussia as a clergyman. He found time from his duties to study astronomy, and began to investigate the Ptolemaic system, for which he substituted the planetary system. The arguments and proofs of this system he published in six volumes, the first copy of which was placed in his hands the day of his death.

"Eisenach," i'zen-ak. A city of Germany on the borders of the Thuringian forest. The castle of Wartburg is near the town.

"Erfurt," ér'fóort. A city of Saxony of about 43,000 inhabitants. The most interesting building there is the old Augustine convent, where Luther lived; it is now used for an asylum for orphans.

"Elector." This elector was Friedrich the Wise, of Saxony. (1463-1525.) He founded the university at Wittenberg, and, although not thoroughly in favor of the Reformation, he protected Luther through his whole life. D'Aubigne says of him: "Friedrich was precisely the prince that was needed for the cradle of the Reformation. Too much weakness on the part of those friendly to the work might have allowed it to be crushed. Too much haste would have caused too early an explosion of the storm that from its origin gathered against it. Friedrich was moderate, but firm. He possessed that Christian grace which God has in all times required from his worshipers—he waited for God."

"Wittenberg." A town of Saxony of about 12,000 inhabitants. The great elector, Luther and Melancthon are buried here. The town is interesting to art students for several pictures of Cranach's which it contains. Schadow's statue of Luther is here, and also one of Melancthon by Drake (see Readings in Art in THE CHAUTAUQUAN for December). The university of Wittenberg was united to that of Halle in 1815.

P. 191, c. 2.—"Scholasticism." Methods of argument and of philosophy, which are very pedantic or subtle, are said to suit the schools or scholars; that is, they are scholastic.

"Aristotelianism," ar'is-to-té-li-an-ism. The methods of argument and the philosophy of the time was that of Aristotle; hence the name.

"Papal Indulgences." The Roman Catholic Church claims that when a sin is committed after baptism, the truly penitent must confess and receive sacramental absolution, but that after this there is a temporal penalty which the sinner must undergo in this world or the next. In the early church, when very severe penance was required of notorious sinners, it was sometimes softened by the prayers or intercessions of outside parties to the pope; this was termed indulgence. When the nations of northern Europe joined the Catholic Church, a custom formed among them was adopted as suitable for penitential atonement. Among these peoples, persons guilty of murder or theft could purchase exemption from the injured parties. When this practice was first admitted the church used the money for the poor, in redeeming captives, and in public worship. Abuses soon followed. The people confounded the remission of temporal penalties with the remission of sins, and the church adopted this method of raising money for the Crusades, to build churches, and finally to enable the popes to gratify their personal extravagance. The abuse was at its height with Tetzel. The council of Trent condemned these measures, and since there have been no conspicuous abuses.

"Tetzel," tét'sel. (1460?-1519.) He was educated at Leipsic, and after entering his order, was frequently employed as a vender of indulgences. He is usually represented as a very immoral man, and his abuse of the indulgence system to have been most flagrant. Catholic historians claim that these statements are overdrawn, although they admit his indiscretion. After his trouble with Luther, Tetzel seems to have lost all his influence with the public.

"Theses." Here are a few examples of these theses:

1. When our Master and Lord Jesus Christ says 'Repent,' he means that the whole life of his faithful servants upon earth should be a constant and continual repentance.

32. Those who fancy themselves sure of their salvation by indulgences will go to the devil with those who teach them this doctrine.

43. We must teach Christians that he who gives to the poor, or lends to the needy, does better than he who buys an indulgence.

95. For it is better, through much tribulation, to enter into the kingdom of heaven than to gain a carnal security by the consolations of a false peace.

"Cajetan," or Cajetan, kăj'e-ta'nus. (1469-1534.) A Dominican monk of superior education. He had held several high offices when sent to Germany to hear Luther. Afterward he went on several important embassies.

"Vicar General." This was Johann Staupitz, a man of superior character and learning. He was a friend of Frederic the Wise, and under his directions the latter had founded the university of Wittenberg. It was he who had secured a professorship for Luther there. In 1522 Staupitz became the abbot of a Benedictine convent.

P. 192, c. 1.—"Melancthon," me-lănk'thon. (1497-1560.) Called the second leader of the Lutheran Reformation. After a most careful education at Heidelberg and Tübingen he was given a professorship at Wittenberg, in 1518. He at once became a warm friend of Luther and the Reformation. His remarkable learning in classic literature and in Bible study, with his clear mind and elegant style, at once made him the most prominent teacher in the university. Although offered professorships at other universities, he would never leave Wittenberg. He devoted himself to theology, but was never ordained. His work was mainly done by writing. He wrote many sermons, defended Luther against Dr. Eck, wrote a system of Protestant theology, several commentaries, and helped Luther in his translation of the Bible. It was Melancthon who drew up the "Augsburg Confession," which became the principal book of the Lutheran church. Melancthon was mild and peace loving, presenting a great contrast to Luther. They were, however, friends to the last, though not always agreeing on the measures to be adopted. After Luther's death Melancthon became the leader of the German Reformation, and so remained until his death.

"Jonas." (1493-1555.) A theologian who became a professor at Wittenberg in 1521. He joined Luther in his great movement, and was with him at the diet at Worms. He also assisted in Luther's translation of the Bible. Having become a preacher at Halle he was banished, and went to Eisleben, where he died.

"Nuncio," nūn'shi-ō. A messenger, or literally one who carries something new. The word is generally applied to a messenger from the pope to a king or emperor.

"Altenburg," al'ten-burg. A town of about 20,000 inhabitants. The capital of a duchy of the German empire, bearing the same name.

"Eck." (1486-1543.) He had been a profound student of theology, and was a powerful opponent in argument. He first appeared as an adversary of Luther, in notes made on the Thesis. After the discussion mentioned he went to Rome to urge severe measures against the reformers, and through his entire life tried to heal the breach in the church.

P. 192, c. 2.—"Perseus," per'se-us. A hero of Grecian legendary lore. The son of Jupiter, who with his mother Danaë, had been cast adrift at sea in a chest. The chest floated to the island Seriphus, where the king wished to marry Danaë, but to get rid of Perseus, sent the latter to fetch the head of the gorgon Medusa. The gorgons were three sisters who had but one eye in common, and turned everything into stone that fell under their gaze. Perseus obtained winged sandals from the Nymphs, and a mirror from Minerva, in which he could see the reflection of Medusa. When the gorgons were asleep he accomplished his errand, and returned in time to rescue his mother and turn the king and his companions into stone. This gorgon head he afterward gave to Minerva, who placed it on her shield.

EXTRACTS FROM GERMAN LITERATURE.

P. 193, c. 2.—"Apollo of the Vatican." See THE CHAUTAUQUAN for November.

"Python." Grecian legends tell of a deluge in which Jupiter destroyed all men on account of their wickedness, except one man and his wife. From the mud left on the earth from this deluge sprang this serpent, or Python. He lived in the caves of Mount Parnassus, but was slain by Apollo, who commemorated his victory by establishing the Pythian games.

"Forehead of Jupiter." Minerva, or the goddess of Wisdom, is said to have sprung from the forehead of Jupiter.

"Graces." The Grecian goddesses which had care of social life and

its pleasures. They inspired all the virtues and accomplishments which make human intercourse delightful, and were the "patronesses of whatever is graceful and beautiful in nature and art."

P. 193, c. 2.—"Pygmalion," pyg-ma'li-on. A legendary king of Cyprus. He is said to have made an ivory statue of a maiden, of such rare beauty that he fell in love with it and prayed Venus to endow it with life. She granted his request, and Pygmalion married the maiden.

"Panthleon," pan-the'on. Literally, the word means to all the gods; i. e., a temple or work dedicated to all the divinities of a nation.

"Transcendentalists." Those persons who in their reasoning go beyond the facts and principles which spring from experience, and claim a knowledge of spiritual and immaterial things. It is also applied to those whose philosophy is vague and indefinite.

P. 194, c. 2.—"Voss." (1751-1826.) A German scholar. He was early in life a tutor, and afterward an editor at Göttingen. In 1778 he became rector of the gymnasium at Ottendorf. In 1781 he published a translation of the Odyssey, which has been the standard German translation ever since. He followed this by many original poems, an edition of Virgil's Georgics, a translation of the Iliad, and in 1799 a translation of the Æneid. Besides these he made translations from many other Latin and Greek writers, as well as from the French and English. He engaged in several controversies with Heyne on literary subjects, and in 1819 an essay in which he attacked the Roman Catholic and the Protestant mystics, caused much discussion.

P. 195, c. 1.—"Faustus." Dr. Johann Faustus, or Faust, is a character belonging to German tradition. "He was a celebrated Franconian, born about 1480. He is said to have studied magic at Cracow. Having mastered all the secret sciences, and being dissatisfied at the shallowness of human knowledge, he made an agreement with the evil one, according to which the devil was to serve Faust for full twenty-four years, after which Faust's soul was to be delivered to eternal damnation. The contract, signed by Faust with his own blood, contained the following conditions: '(1) He shall renounce God and all celestial hosts; (2) he shall be an enemy of all mankind; (3) he shall not obey priests; (4) he shall not go to church or partake of the holy sacraments; (5) he shall hate and shun wedlock.'" Faust now is attended by a spirit, Mephistopheles, who invents all sorts of dissipation to attract him. He wears of his life, but can not escape. Toward the end of the period he seeks the church, but all flee from him. At last he is carried away by the evil spirit. It is said that a man who was believed to have sold himself to the devil did live during the time of Melancthon and Luther. Goethe, in his poem, attempts to solve the mystery of the legend. He represents his hero as under the influence of evil that his longing for knowledge has caused, but does not permit the evil to gain the mastery in the end. Faust is represented as seeking and finding in a work which is for the benefit of others, the relief which learning, pleasure, art and culture have denied him. The selection here given is from the first part of the poem, where Faust is watching the sunset at the close of Easter Sunday.

P. 195, c. 2.—"Wagner." —"Is a very dull pedant. All that Faust disdains as the dry bones and mere lumber of erudition, is choice meat and drink for the intellectual constitution of Wagner. No amount of our modern preparations for examinations would have been too great for him. He is charmed with dead formulas, and can not have too many of them impressed upon his memory. * * * The character of this 'dry-as-dust' pedant is admirably contrasted with that of Faustus."—Gostwick and Harrison.

"Propagandist," prop'a-gan/dist. One who devotes himself to extending any system or principles.

P. 196, c. 1.—"Rose." In the Gothic system not only the rose was copied, but the oak, oak leaves, thistle, the ivy, the holly, and all leaves and vegetable forms that could be copied.

"Foliated." Where the mullions or bars which separate the lights in windows are broken into curves, arches and flowing lines, and leaf-like ornaments are added, we have foliated tracery.

SUNDAY READINGS AND POLITICAL ECONOMY.

P. 201, c. 1.—"Forensic," fo-rén'sic. Derived from forum. A place where court was held; hence, used in courts; appropriate to argument or debate.

"Paley." (1743-1805.) An English theologian. His most important works are "Principles of Moral and Political Economy," "Horæ Paulinæ," "Reasons for Contentment," and his "Natural Theology."

"In foro conscientia." Before the tribunal of conscience.

P. 202, c. 2.—"Carey." (1793—) He was educated in Philadelphia, to the book trade, and became a partner in his father's firm, afterward the largest publishing firm in the country. In 1835 he left the business to devote himself to the study of political economy. The chief principles of his system are given in the present article.

"Diametrically," di-a-mét'ric-al-ly. As remote as possible, as if at the opposite end of a diameter.

P. 203, c. 1.—"Ricardo," re-kar'do. (1772-1823.) An English political economist. A Jew; he was educated for a business life, and was associated with his father. As he became a Christian the partnership was dissolved. Ricardo, however, became wealthy, studied much, and finally became a member of parliament. His chief work is "On the Principles of Political Economy and Taxation."

"Malthus." (1766-1834.) An English political economist. He was educated for the ministry and took a parish. In 1798 he published the work on which his reputation rests mainly: "An essay on the Principle of Population." He afterward traveled much to obtain data to support his theories, and in 1826 published the sixth and last edition.

READINGS IN ART.

P. 204, c. 1.—"Lintels." A horizontal piece of wood or stone placed above the opening for a window or door.

"Trabeated," tra-be-a'ted.

P. 204, c. 2.—"Etruscans." A people formerly inhabiting Etruria or Tuscany, a portion of ancient Italy. Very little is known of their origin, though they are supposed to have come from the north. The people were short and heavy, their language completely isolated from any known language. They formed a confederacy of twelve cities, possessed many flourishing colonies, and carried on commerce. Their religion was a polytheism resembling the Greeks. The monuments of these people still remaining are the walls of their cities, sewers, vaults, tombs, and bridges. Their bronze statues were famous, as well as their pottery. The Etruscans were most prosperous the centuries before and after the founding of Rome. In the long wars which Rome carried on in her struggle to become mistress of Italy, the power of Etruria was finally broken.

"Romanesque," ró-man-ěsk.

"Byzantine," by-zán'tine, or byz'an-tine.

"First Crusade." It started out in 1096.

P. 205, c. 1.—"Buttress." A projecting support applied to the exterior of a wall, most commonly to churches of the gothic style.

"Turret." A small tower attached to a building and rising above it.

P. 205, c. 2.—"Pilasters," pi-las'ter. A square column sometimes free, but oftener set into a wall at least a fifth of its diameter. A pilaster has a base, capital and entablature, as other columns.

"Polychromy," pol'y-chrō'my. The practice of making a building in many colors; also of coloring statues or other works of art to imitate nature.

"Beni-Hassan," ba'ne-has'san. On the east bank of the Nile, about one hundred and forty miles south of Cairo, and famous for its grottoes. There are about thirty of them. They contain an almost endless number of paintings, representing scenes from the life of the ancient

Egyptians. Almost our entire knowledge of ancient Egyptian life is based on them. Charles Dudley Warner says of the grottoes: "They are fine, large apartments, high and well lighted by the portal. Architecturally no tombs are more interesting; some of the ceilings are vaulted in three sections; they are supported by fluted pillars, some like the Doric, and some in the beautiful lotus style; the pillars have architraves; and there are some elaborately wrought false door ways."

"Luxor," lux'or. A village on the east bank of the Nile, which, with Karnak contains part of the ruins of Thebes.

"Denderah." "Edfou." See THE CHAUTAUQUAN for October.

"Cephren," ceph'ren; "Mycerinus," mys'e-ri'nus.

"Syene," sy'e-ne. A place in Upper Egypt where syenite was quarried by the ancient Egyptians.

P. 206, c. 1.—"Truncated pyramid." One whose vertex or top is cut off by a plane parallel to the base.

"Typhonia," ty-pho'ni-a; "Mammisee," mam-mi'si. "Pylon," py'lon.

"Hypostyle," hy'po-stile. A hall, with pillars; that which rests on columns.

"Clerestory," clere'stō-ry, or clear-story. An upper story or row of windows in a building of any kind, which rises clear above adjoining parts of the building.

"Usertesen," u-ser'te-sen.

P. 206, c. 2.—"Abacus," ab'a-cus. A tablet or plate upon the capital of a column, between it and the architrave.

"Architrave," ar'chi-trave. The lower division of an entablature, resting on the column or the abacus.

"Plinth." The lowest division of the base of a column. A square, projecting piece with vertical face.

"Astragal," ás'tra-gal. A little round moulding which surrounds the top or bottom of a column in the form of a ring, representing a ring or band of iron, to prevent the splitting of the column. It is often cut into beads or berries, and is used in ornamental entablatures to separate the several faces of the architrave.—Webster.

"Cavetto," ca-vét'to.

"Façade," fa-sád'. Front; front view of a building.

SELECTIONS FROM AMERICAN LITERATURE.

P. 209, c. 1.—"Gentian," jěn'shan. The *Gentianus crinita*. A branching plant found in low grounds in autumn. The lobes of the corolla are of a deep sky-blue and beautifully fringed.

"Thetis," the'tis. The selection here given is taken from the first book of the Homeric story. Agamemnon, the commander-in-chief of the Greeks, has compelled Achilles, the favorite warrior, to give up Briseis, his captive. In revenge Achilles has shut himself up in his tent, refusing to take further part in the war. Thetis, the mother of Achilles, has promised to obtain from Jupiter, the king of the gods, a promise to give the victory to the Trojans until Agamemnon shall repent the wrong. Thetis was one of the daughters of Nereus, called here the "Ancient of the Deep," the god of the Mediterranean.

"Santa Filomena," Saint Fil-o-me'na. In the early part of this century a grave was discovered with a Latin inscription which read "Filomena, peace be with you." She was at once accepted as a saint, and many wonders worked by her. In a picture by Sabatelli, this saint is represented hovering over a group of sick and maimed, healed by her intercession. Longfellow here gives the title to Florence Nightingale.

TALK ABOUT BOOKS.

"Home Worship, and the Use of the Bible in the Home,"* is a book of real excellence, and will do good. Home, worship, and the Bible as the basis and inspiration of both, are things of no ordinary importance, and it is a joy to every Christian philanthropist that, severally, and in their relation to each other, they are attracting the attention of the thoughtful. The work, heartily commended, is a book for the times—meets a want

*Home Worship and the Use of the Bible in the Home, by J. P. Thompson, D.D., and Rev. C. H. Spurgeon. Edited by Rev. James H. Taylor, D.D. New York: A. C. Armstrong & Son.

that many have felt, and guards against dangers to which all are liable. In the midst of multifarious benevolent activities, plans and schemes innumerable, for public service, it is quite possible to be so much occupied with the out-door enterprises of the church, as, unwisely, to neglect the religion of the home. The plan and execution of the work are both admirable. The well arranged scripture readings open up the Bible in the richness of its practical teachings, and the daily lessons are readily found suited to every need. The notes, with but few exceptions, express in a plain, terse, common-sense manner, the truth, as held by most evan-

gical Christians. Being eminently practical, devout in spirit, and free from any offensive dogmatism, they will be accepted as most valuable, even by those who, in a few instances, might suggest a different exposition. As a help to the spirituality and joyousness of domestic worship, the book will prove to many a treasure of priceless worth.

"Christian Educators in Council,"* a well filled volume, containing sixty addresses delivered in the National Educational Assembly, at Ocean Grove, August, 1883. The book, like the Assembly, whose work it reports, must do good, and we wish for it a very wide circulation. For this great Assembly, from whose discussions and methods much is expected, the country is indebted to the indefatigable exertions of Dr. Hartzell. From years of toil among the lowly he knew their needs, and the demand for greater and more concerted efforts in their behalf. The thought of a really national convention, with a broad platform on which all Christian statesmen, educators and philanthropists might be represented, was to him an inspiration. After consultation the Assembly was convened, organized, and furnished with a detailed program of the exercises that proved intensely interesting to the multitudes that were present. It was a grand assembly—grand in its conception, in the objects contemplated, and not less in its *personel*. There were able ministers of nearly all denominations, and honored laymen, not a few. The Secretaries of the Benevolent Societies, the U. S. Commissioner of Education, Presidents of Colleges, Editors, Teachers, and Elect Ladies were all heard in person or through well written communications. And they evidently speak from their convictions, confronting us, not with theories, but with facts—facts bearing on the most difficult problems with which the nation has to grapple, *illiteracy*, and the *shame of polygamous Mormonism*. Ignorance is a foe to freedom that must be expelled, and Mormon lust, that changes the home to a harem, crucifies womanhood, and makes children worse than fatherless must be made as perilous to the guilty, as it is infamous in the eyes of all good citizens. The well considered, manly utterances from Ocean Grove have our hearty indorsement. It is a pleasure to say the speeches that so enthused those vast audiences seem worthy of the men and of the occasion.

The admirable Home College Series has reached the eighty-third number. A decidedly practical and useful idea it was to throw these terse, interesting scraps of knowledge into everybody's hands. The tracts are all good. One that will please all reading people, as well as be suggestive to those who do not know how to read, is Rev. H. C. Farrar's talk on "Reading and Readers."† While it contains nothing new, it tells well many true and essential facts that every reader ought to consider.

There are no two characters in the list of English writers who hold so warm a place in our hearts as Charles and Mary Lamb. We mention them together, for who could separate him from her any more than they could separate him from his essays? Mary, Charles, Elia, the tales and sketches are woven together in a way unique in literature. It is strange that with all its interests Mary Lamb's life should never have been written until now, save in scraps, and as the necessary complement in every sketch of her brother. The cloud that hung over her gentle life, the tender, close friendship of the brother and sister, and the interesting circle of friends that formed their circle, make her an exceptionally entertaining character. Mrs. Gilchrist‡ in her book has given us the best that is known of Mary Lamb. Little of the material is entirely new; with few exceptions it has all appeared before, but never so well arranged. The story is carried from her earliest life, when the unsympathetic mother would say to the child, whose brain was full of morbid phantoms: "Polly, what are those poor, crazy, moythered brains of yours thinking alway?" to the time when at eighty death ended the shadowed life. The Hazlitts, Stoddarts, Coleridge and many others receive much attention, but this is necessary, so intimately was Mary Lamb's life joined to her friends. In a few instances, however, notes on people are introduced into the text, which seem entirely irrelevant, and would have figured better as foot-notes, if introduced at all; as in the case of the story of Mr. Scott, the Secretary of Lord Nelson.

*Christian Educators in Council. Sixty addresses by American Educators. Compiled and edited by Rev. J. C. Hartzell, D.D. New York: Phillips & Hunt. Cincinnati: Walden & Stowe. 1883.

†Reading and Readers. By H. C. Farrar, A.B. New York: Phillips & Hunt. 1883.

‡Mary Lamb. By Anne Gilchrist. Boston: Robert and Brothers. 1883.

Of all our elegant holiday books not one is more chaste and beautiful than the Artist's Edition of Gray's *Elegy*.* It is the first really fine edition of the poem ever published. It could hardly have been better done. The illustrations are the work of such eminent artists as R. Swain Gifford, F. S. Church, etc., and are perfectly suited to the calm, dignified and thoughtful beauty of the poem.

A pleasing book for fireside reading is "Bright and Happy Homes."† It is largely a compilation, and, too, on a subject on which much fresh and valuable matter is being constantly written. The book contains, however, the best and wisest articles on all varieties of home affairs, and can not fail to both amuse and instruct.

BOOKS RECEIVED.

"Life of Luther." By Julius Köstlin. With illustrations from authentic sources. Translated from the German. Charles Scribner's Sons. New York. 1883.

"A Brief Handbook of English Authors." By Oscar Fay Adams. Boston: Houghton, Mifflin and Company. 1884.

"The Odes of Horace." Complete in English Rhyme and Blank Verse. By Henry Hubbard Pierce, U.S.A. Philadelphia: J. B. Lippincott & Co. 1884.

"Richard's Crown; How he Won and Wore It." By Anna D. Weaver. Published by the author. Jamestown, New York.

"An Elegy Written in a Country Churchyard." By Thomas Gray. The artist's edition. Philadelphia: J. B. Lippincott & Co. 1883.

"Probationer's Catechism and Compendium." By Rev. S. Olin Garrison, M.A. New York: Phillips & Hunt; Cincinnati: Walden & Stowe. 1883.

"Small Things," by Reese Rockwell. New York: Phillips & Hunt; Cincinnati: Walden & Stowe. 1883.

"His Keeper." By Miss M. E. Winslow. New York: Phillips & Hunt; Cincinnati: Walden & Stowe. 1883.

"Sights and Insights; or, Knowledge by Travel." By Rev. Henry W. Warren. New York: Phillips & Hunt; Cincinnati: Walden & Stowe.

"Worthington's Annual." New York: R. Worthington. 1884.

"Appleton's European Guide-Book for English-Speaking Travelers." Nineteenth edition. Two volumes. New York: D. Appleton & Co. 1883.

"A Yacht Voyage." Letters from High Latitudes. By Lord Dufferin. New York: R. Worthington. 1882.

"Across Patagonia." By Lady Florence Dixie. New York: R. Worthington. 1881.

"The Watering Places and Mineral Springs of Germany, Austria and Switzerland." By Edward Gutmann, M.D. New York: D. Appleton & Co. 1880.

*An Elegy Written in a Country Churchyard. By Thomas Gray. The Artist's Edition. Philadelphia: J. B. Lippincott & Co. 1883.

†Bright and Happy Homes. A Household Guide and Companion. By Peter Parley, Jr. Chicago and New York: Fairbanks, Palmer & Co. 1882.

This powder never varies. A marvel of purity, strength and wholesomeness. More economical than the ordinary kinds, and can not be sold in competition with the multitude of low test, short weight, alum or phosphate powders. Sold only in cans. ROYAL BAKING POWDER CO., 106 Wall Street, New York.

THE CHAUTAUQUAN.

1883-1884.

The Fourth Volume Begins with October, 1883.

A monthly magazine, 76 pages, ten numbers in the volume, beginning with October and closing with July.

THE CHAUTAUQUAN

is the official organ of the C. L. S. C., adopted by the Rev. J. H. Vincent, D.D., Lewis Miller, Esq., Lyman Abbott, D.D., Bishop H. W. Warren, D.D., Prof. W. C. Wilkinson, D.D., and Rev. J. M. Gibson, D.D., Counselors of the C. L. S. C.

One-half of the "Required Readings" in the C. L. S. C. course of study for 1883-84 will be published only in THE CHAUTAUQUAN.

Our columns will contain articles on Roman, German, French and American History, together with "Sunday Readings," articles on Political Economy, Civil Law, Physical Science, Sculpture and Sculptors, Painting and Painters, Architecture and Architects.

Dr. J. H. Vincent will continue his department of C. L. S. C. Work.

We shall publish "Questions and Answers" on every book in the course of study for the year. The work of each week and month will be divided for the convenience of our readers. Stenographic reports of the "Round-Tables" held in the Hall of Philosophy during August will be given.

Special features of this volume will be the "C. L. S. C. Testimony" and "Local Circles."

THE EDITOR'S OUTLOOK, EDITOR'S NOTE-BOOK AND EDITOR'S TABLE, WILL BE IMPROVED.

The new department of *Notes on the Required Readings* will be continued. The notes have met with universal favor, and will be improved the coming year.

Miscellaneous articles on Travel, Science, Philosophy, Literature, Religion, Art, etc., will be prepared to meet the needs of our readers.

Prof. Wallace Bruce will furnish a series of ten articles, especially for this Magazine, on Sir Walter Scott's "Waverley Novels," in which he will give our readers a comprehensive view of the writings of this prince of novelists.

Rev. Dr. J. H. Vincent, Rev. Dr. G. M. Steele, Prof. W. C. Wilkinson, D.D., Prof. W. G. Williams, A.M., Bishop H. W. Warren, A. M. Martin, Esq., Rev. C. E. Hall, A.M., Rev. E. D. McCreary, A.M., and others, will contribute to the current volume.

The character of THE CHAUTAUQUAN in the past is our best promise of what we shall do for our readers in the future.

THE CHAUTAUQUAN, one year, - - - \$1.50

CLUB RATES FOR THE CHAUTAUQUAN.

Five subscriptions at one time, each, - - - \$1.35
Or, for the five - - - 6.75

In clubs, the Magazine must go to one postoffice.

Remittances should be made by postoffice money order on Meadville, or draft on New York, Philadelphia or Pittsburgh, to avoid loss. Address,

General Secretary—Albert M. Martin, Pittsburgh, Pa.

REQUIRED READING

FOR THE

Chautauqua Literary and Scientific Circle for 1883-4.
FEBRUARY.

GERMAN HISTORY.

By Rev. W. G. WILLIAMS, A.M.

V.

The present and last of this series of readings in German history includes an outline of the historical changes and great events of the period of nearly four hundred years since the Reformation. Though condensed to a very great degree, it furnishes the reader a survey of that important period, and will afford him a helpful basis for his future study of the history of Germany. The reading closes with a selection from the pen of the poet and historian, Schiller, descriptive of the battle of Lutzen, where Gustavus Adolphus, that greatest character and hero of the Thirty Years' War, met his fate.

SUMMARY OF GERMAN HISTORY FROM THE REFORMATION TO THE PRESENT TIME.

From the death of Luther, 1546, to the end of the century the struggle continued. Now and then there came a brief pause to the general strife, such as followed the Treaty of Pissau, or the Religious Peace of Augsburg, but it was soon renewed by the tyranny or treachery of the Catholic powers, whose hatred of the followers of Luther and of the spirit of protestantism did not abate till Europe had passed through the most terrible and disastrous war of history. This was the thirty years' war, dating from 1618 to 1648, and involving not only the whole German Empire, but also the principal states of Europe. Scarcely, if ever, has there been known such depletion of population and resources. It was finally brought to an end by the peace of Westphalia, when the worn-out and impoverished states subscribed to a treaty which gave comparative toleration in Germany. Under its conditions, in all religious questions Protestants were to have an equal weight with Catholics in the high courts and diet of the empire. The Calvinists were also included with the Lutheran and Reformed creeds in this religious peace. By its termination of the religious wars in Europe the peace of Westphalia forms a great landmark in history.

The seventeenth century, from the thirty years' war on to its close, might not inappropriately be called the period of pusillanimity in Germany. Public buildings, schools and churches were allowed to stand as ruins while the courts of petty princes were aping the stiff, formal, artificial manners of that of the

French monarch, Louis XIV. The latter seeing the weakened state of the empire seized the opportunity to enlarge his own kingdom at the expense of Germany. He laid claim to Brabant and many of the fortresses of the frontier fell into the hands of the French. His ambition was only checked by the intervention of Holland, England and Sweden, and the war terminated by the peace of Aix-la-Chapelle. Meanwhile the Turks in alliance with the Hungarians marched with an army of 200,000 up the Danube and encamped around the walls of Vienna. There is good evidence that they were aided and abetted in this invasion by Louis XIV. The Emperor Leopold fled, leaving his capital to its fate. But the little guard of 13,000 men under Count Stahremberg held the fortifications against the invader's overwhelming force till Duke Charles of Lorraine and the Elector of Saxony with their armies, and still another army of 20,000 Poles under their king John Sobieski came to their relief. The Turkish army was routed and driven into Hungary. All this time Louis, like an eager bird of prey, was watching Germany. Finally, in 1688, two powerful French armies appeared upon the Rhine. The allied states at last saw their imminent danger and rallied to resist and drive back the common foe. Louis resolved to ruin if he could not possess the country; so he adopted a course than which a more wanton and barbarous was never known, even in the annals of savagism. Vines were pulled up, fruit-trees cut down, and villages burned to the ground. Multitudes of defenseless people were slain in cold blood, and 400,000 persons beggared. Germany, aroused at last, now entered with vigor into the war with France, and carried it on till both sides were weary and exhausted. It was concluded by the Treaty of Ryswick.

The eighteenth century dawned, still to witness Germany the arena of war. Indeed from earliest history her soil, especially along the Rhine, had been the battle-ground of Europe. This time it was the war of the Spanish succession, whose tangled episodes and details we can not undertake to follow. It will be remembered by the student of history for its great battle of Blenheim, where the allied armies under the Duke of Marlborough and Prince Eugene defeated and routed the French. Louis XIV. was now old, infirm, and tired of war, and hence consented to a treaty of peace, which was concluded March 7, 1714.

The century now begun witnessed the rise of Prussia out of the German chaos and the wonderful and brilliant career of Frederick the Great. It also saw the stronger and more enlightened reigns of Maria Theresa and Joseph II. in Austria.

Though the wars never ceased, breaking out again in one quarter while peace was being concluded in another, yet the century as a whole gave prophesy of a coming better state of affairs.

The grandfather of Frederick the Great had founded the university of Halle in 1694, and in 1711 an academy of science was established in Berlin upon a plan drawn up by the philosopher Leibnitz. Frederick William I., father of Frederick the Great, though coarse and brutal in his nature, had the wisdom to see the importance of German education and of breaking off from the established custom of imitating French man-

ners and life. He accordingly established four hundred schools among the people, and by the vigor and economy of his reign contributed to the development of the character and individuality of his people. Frederick the Great and his rival, Maria Theresa, possessed greater elements of personal character and intelligence than their predecessors, and hence gave to their subjects, if not a more liberal form, at least a higher order of government. Contemporary with these was the beginning of that literary bloom which, by the genius of Lessing, Herder, Klopstock, Goethe and Schiller, gave to Germany a glory surpassing all she has ever achieved, either by war or statesmanship.

We have now reached, just before the beginning of the nineteenth century, the time of the French Revolution. It was a time that required great political prudence on the part of the rulers in Germany. Unhappily the successors of Frederick the Great and Joseph II. were incompetent to their responsibilities. That great military genius that rose out of the turmoil and chaos of the revolution in France is soon marching through Germany, and on the 6th of August, 1806, Francis II., the last of the line, laid down his title of "Emperor of the Holy Roman Empire of the German nation" at the feet of Napoleon. Thus, just a thousand years after Charlemagne the empire of his founding passed away. It had culminated under the Hohenstauffens, and for a long time before its formal burial had existed in tradition rather than in fact. Truly may it be said that Germany was as far as ever from being a nation at the beginning of our century.

From 1806 to 1814 Germany underwent the humiliation of subjection to the power of Napoleon. By a succession of victories, such as Jena and Auerstädt, he cowed the spirit of the German princes and proceeded to construct the famous "Rhine-Bund" which made him protector over a territory embracing fourteen millions of German inhabitants, and imposed upon the states and principalities included conditions the most exacting and disgraceful. Prussia and Austria, which held out at first, were also compelled by force of his victorious armies to yield, and Napoleon dictated terms to all Germany. He marched in triumph into Berlin and Vienna; he changed boundaries, levied troops, prescribed the size of their standing armies at will, and when he set out on his campaign against Alexander of Prussia 200,000 previously conquered Germans marched at his command. Such was the abject state of Germany during those years when it seemed that all Europe must bend before the insatiate conqueror. But in the year 1813 the spirit of liberty began to live again. The revival began, however, not with the princes, but in the breasts of the people. The works of the great German authors were becoming familiar to them and were producing their effect. Klopstock was awakening a pride in the German name and race; Schiller was thrilling the popular heart with his doctrine of resistance to oppression, whilst the songs of Körner and Arndt were inspiring courage and hope. All classes of the people participated in the uprising, and within a few months Prussia had an army of 270,000 soldiers in the field ready to resist the power of France. This was the beginning of the turn in the tide of affairs which led in 1815 to the overthrow of Napoleon at Waterloo, and gave liberation to Germany.

The remaining history of the present century is that of the Confederation formed in 1815 and lasting till 1866; of the North German Confederation which succeeded the above, and continued to the establishing of the present empire in 1871, as a result of the Franco-Prussian war; and of the new empire to the present time. The confederation of 1815, known as the "Deutscher Bund," embraced a part of Austria, most of Prussia, the kingdoms of Bavaria, Würtemberg, Saxony and Hanover, the electorate of Hesse-Cassel, a number of duchies, principalities and free cities; in all thirty-nine states.

When in 1866 the "Bund" was dissolved and the North German Confederation formed, Austria was excluded, and Prussia

assumed the headship of the new compact which embraced the states north of the Main. The term Germany, from 1866 to 1871, designated the new Confederation, and the four South German States, Bavaria, Würtemberg, Baden and Hesse Darmstadt. The four latter had been made independent states, but were united with the North German Confederation by the Zollverein, and by alliances offensive and defensive.

The late war between France and Germany belongs to the history of the present generation. Its great events and changes to Germany are within the memory of many of our readers. It will be longest remembered because of its association with the formation of the present empire. While the siege of Paris was yet in progress (January 1871) the spirit of enthusiasm became so great, and the desire for national unity so strong, that the various sovereign states, as well as the members of the Confederation determined on a revival of the empire. At their joint instance, in the great hall of Louis XIV., at Versailles, King William of Prussia received the imperial crown with the title of German Emperor. Under this new empire the whole German nation, Austria alone excepted, is united more closely than it has been for more than six hundred years, or since the Great Interregnum. It is not too much to say that the last decade has been the brightest and most prosperous in German history. The new empire has made possible and developed a feeling of patriotism which could not exist while the race was divided into fifty or more separate states. It was the complaint of her greatest poet, Goethe, that there was no united Germany to awaken pride and patriotism in the German heart. That condition of things is now done away by the present national government, which, though retaining many of the imperial features of the past, has, at the same time, embodied some of the more liberal governmental ideas of the present age. Such, for instance, is the election by direct universal suffrage and by ballot, of the Reichstag, one of the two legislative councils of the empire. The German name was never more respected and honored throughout the world than it is to-day; not alone for her eminent position among the powers of Europe, but for her high rank in the empires of art, philosophy and science. Her great universities are admired wherever in the world there is appreciation for scholarship, industry and genius. If the present has any right to prophesy it must be that the coming years contain for Germany less of wars and dissension, more of peace, coöperation and unity.

BATTLE OF LUTZEN—DEATH OF GUSTAVUS ADOLPHUS.

"At last the fateful morning dawned, but an impenetrable fog, which spread over the plain, delayed the attack till noon. * * * 'God with us!' was the war cry of the Swedes; 'Jesus Maria!' that of the Imperialists. About eleven the fog began to disperse, and the enemy became visible. At the same moment Lutzen was seen in flames, having been set on fire by command of the duke, to prevent his being outflanked on that side. The charge was now sounded; the cavalry rushed upon the enemy, and the infantry advanced against the trenches.

"Received by a tremendous fire of musketry and heavy artillery, these intrepid battalions maintained the attack with undaunted courage, till the enemy's musketeers abandoned their posts, the trenches were passed, the battery carried and turned against the enemy. They pressed forward with irresistible impetuosity; the first of the five imperial brigades was immediately routed, the second soon after, and the third put to flight. But here the genius of Wallenstein opposed itself to their progress. With the rapidity of lightning he was on the spot to rally his discomfited troops; and his powerful word was itself sufficient to stop the flight of the fugitives. Supported by three regiments of cavalry, the vanquished brigades, forming anew, faced the enemy, and pressed vigorously into the broken ranks of the Swedes. A murderous conflict ensued. * * * In the meantime the king's right wing, led by himself, had fallen upon the enemy's left. The first impetuous shock of the heavy Finland cuirassiers dispersed the

lightly mounted Poles and Croats, who were posted here, and their disorderly flight spread terror and confusion among the rest of the cavalry. At this moment notice was brought to the king, that his infantry was retreating over the trenches, and also that his left wing, exposed to a severe fire from the enemy's cannon posted at the windmills, was beginning to give way. With rapid decision he committed to General Horn the pursuit of the enemy's left, while he flew, at the head of the regiment of Steinback, to repair the disorder of his right wing. His noble charger bore him with the velocity of lightning across the trenches, but the squadrons that followed could not come on with the same speed, and only a few horsemen, among whom was Francis Albert, Duke of Saxe-Lauenberg, were able to keep up with the king. He rode directly to the place where his infantry were most closely pressed, and while he was reconnoitering the enemy's line for an exposed point to attack, the shortness of his sight unfortunately led him too close to their ranks. An imperial Gefreyter, remarking that every one respectfully made way for him as he rode along, immediately ordered a musketeer to take aim at him. 'Fire at him yonder,' said he, 'that must be a man of consequence.' The soldier fired, and the king's left arm was shattered. At that moment his squadron came hurrying up, and a confused cry of 'the king bleeds! the king is shot!' spread terror and consternation through all the ranks. 'It is nothing, follow me,' cried the king, collecting his whole strength; but overcome by pain, and nearly fainting, he requested the Duke of Lauenberg, in French, to lead him unobserved out of the tumult. While the duke proceeded toward the right wing with the king, to keep this discouraging sight from the disordered infantry, his majesty received a second shot through the back, which deprived him of his remaining strength. 'Brother,' said he, with a dying voice, 'I have enough! look only to your own life.' At the same moment he fell from his horse, pierced by several more shots; and abandoned by all his attendants, he breathed his last amidst the plundering bands of the Croats. His charger flying without its rider, and covered with blood, soon made known to the Swedish cavalry the fall of their king. They rushed madly forward to rescue his sacred remains from the hands of the enemy. A murderous conflict ensued over the body, till his mangled remains were buried beneath a heap of slain. Bernard, Duke of Saxe-Weimar, gave to the bereaved Swedes a noble leader in his own person; and the spirit of Gustavus led his victorious squadrons anew.

"The sun was setting when the two lines closed. The strife grew hotter as it drew to an end; the last efforts of strength were mutually exerted, and skill and courage did their utmost to repair in these precious moments the fortune of the day. It was in vain; despair endows every one with superhuman strength; no one can conquer, no one will give way. The art of war seemed to exhaust its powers on one side, only to unfold some new and untried masterpiece of skill on the other. Night and darkness at last put an end to the fight, before the fury of the combatants was exhausted; and the contest only ceased, when no one could any longer find an antagonist. Both armies separated, as if by tacit agreement; the trumpets sounded, and each party claiming the victory, quitted the field."

[End of German History.]

SELECTIONS FROM GERMAN LITERATURE.

ALEXANDER VON HUMBOLDT.

After every deduction has been made he yet stands before us as a colossal figure not unworthy to take his place beside Goethe as the representative of the scientific side of the culture of his country.—*Encyclopædia Britannica*.

The Cataracts of the Orinoco.

The impression which a scene makes upon us is not so deeply fixed by the peculiarities of the country as by the light, the clear azure or the deep shade of low lying clouds, under which hill and river lie. In the same way descriptions of scenes impress us with more or less force according as they harmonize with our emotions. In our inner susceptible soul the physical world is reflected true and life-like. What gives its peculiar character to a landscape, to the outline of the mountain range which borders the dimly distant horizon, to the darkness of the pine forest, to the mountain stream which rushes madly between overhanging cliffs? They all stand in strange mysterious relations with the inner life of man, and on these relations rest the nobler share of enjoyment which nature affords. Nowhere does she impress us more strongly with consciousness of her greatness; nowhere does she speak more powerfully to us than under the Indian heavens. If I venture here to describe that country may I hope that its peculiar charm will not remain unfelt? The memory of a distant richly-endowed land, the glimpse of a luxuriant, vigorous plant-life refreshes and strengthens the mind as the restless worn spirit finds pleasure in youth and its strength.

Western currents and tropical winds favor the voyage over the peaceful straits which fill up the wide valley between America and western Africa. Before the coast appears one notices that the waves foam and dash over each other. Sailors who were unacquainted with the region would suspect shallows to be near, or fresh water springs, such as are in mid ocean among the Antilles. As the garnet coast of Guiana draws near there appears the wide mouth of a mighty stream. It bursts forth like a shoreless sea and covers the surrounding ocean with fresh water. The name Orinoco which the first discoverers gave to the river, and which owes its origin to a confusion of language, is unknown in the interior of the country, for the uncivilized inhabitants give names to only those objects which might easily be mistaken for others. The Orinoco, the Amazon, the Magdalena are called simply the river, in some cases perhaps, the great river, the great water, when the inhabitants wish to distinguish them from a small stream.

The current which the Orinoco causes between the continent of South America and the island of Trinidad is so powerful that ships which attempt to struggle against it with outspread sails are scarcely able to make any headway. This desolate and dangerous place is called the Gulf of Sorrow; the entrance is the Dragon's Head. Here lonely cliffs rise tower-like in the raging flood. They mark the old, rocky isthmus which, cut off by the current, once joined the island of Trinidad and the coast of Venezuela.

The appearance of this country first convinced the hardy discoverer, Colon, of the existence of the American continent. Acquainted with nature as he was he concluded that so monstrous a body of fresh water could only be collected by a great number of streams, and that the land which supplied this water must be a continent and not an island. As the followers of Alexander believed the Indus, filled with crocodiles, was a branch of the Nile, so Colon concluded that this new continent was the easterly coast of the far away Asia. The coolness of the evening air, the clearness of the starry firmament, the perfume of the flowers borne on the breeze, all led him to believe that he had approached the garden of Eden, the sacred home of the first human beings. The Orinoco seemed to him one of the four streams which are said to flow from Paradise, and to water the plants of the newly-planted earth.

This poetical passage taken from Colon's diary has a peculiar interest. It shows anew how the fancies of the poet are in the discoverer as in every great human character.

HEINRICH HEINE.

Heine had all the culture of Germany; in his head fermented all the ideas of modern Europe. And what have we got from Heine? A half-

result, for want of moral balance, and nobleness of soul, and character.
—*Matthew Arnold.*

In spite of the bitterness of spirit that pervades all his writings he possessed deep natural affections. His mother survived him, and although almost entirely separated from him for the last twenty-five years, he often introduces her name in his writings with expressions of reverence.—*Translated by E. A. Bowring.*

Heine left a singular will, in which he begged that all religious solemnities be dispensed with at his funeral. * * He added that this was not the mere freak of a freethinker, for that he had for the last four years dismissed all the pride with which philosophy had filled him, and felt once more the power of religious truth. He also begged forgiveness for any offence which, in his ignorance he might have given to good manners and good morals.—*Translated preface.*

To Matilda.

I was, dear lamb, ordained to be
A shepherd here, to watch o'er thee;
I nourished thee with mine own bread,
With water from the fountain head.

And when winter storm roared loudly,
Against my breast I warmed thee proudly;
Then held I thee, encircled well,
Whilst rain in torrents round us fell,
When, through its rocky dark bed pouring,
The torrent with the wolf, was roaring,
Thou fear'dst not, no muscle quivered,
E'en when the highest pine was shivered
By forked flash—within mine arm
Thou slept'st in peace without alarm.

My arm grows weak, and fast draws near
Pale death! My shepherd's task so dear,
And pastoral care approach their end.
Into thy hands, God, I commend
My staff once more. O do thou guard
My lamb, when I, beneath the sword
Am laid in peace, and suffer ne'er
A thorn to prick her anywhere.

From thorny hedges guard her fleece,
May quagmires ne'er disturb her peace.
May there spring up beneath her feet
An ample crop of pasture sweet,
And let her sleep without alarm,
As erst she slept within mine arm!

I have been wont to bear my head right high,
My temper too is somewhat stern and rough;
Even before a monarch's cold rebuff
I would not timidly avert mine eye.
Yet mother dear, I'll tell it openly:
Much as my haughty pride may swell and puff,
I feel submissive and subdued enough,
When thy much cherished, darling form is nigh.
Is it thy spirit that subdues me then,
Thy spirit grasping all things in its ken,
And soaring to the light of heaven again?
By the sad recollection I'm oppress'd
That I have done so much to grieve thy breast,
Which loved me more than all things else, the best.

Prose Extracts From Heine.

The French are the chosen people of the new religion, its first gospels and dogmas have been drawn up in their language; Paris is the New Jerusalem, and the Rhine is the Jordan which divides the consecrated land of freedom from the land of the Philistines.

When Candide came to Eldorado, he saw in the streets a number of boys who were playing with gold nuggets instead of marbles. This degree of luxury made him imagine that they must be the king's children, and he

was not a little astonished when he found that in Eldorado gold nuggets are of no more value than marbles are with us, and that the school-boys play with them. A similar thing happened to a friend of mine, a foreigner, when he came to Germany and first read German books. He was perfectly astounded at the wealth of ideas which he found in them; but he soon remarked that ideas in Germany are as plentiful as gold nuggets in Eldorado, and that those writers whom he had taken for intellectual princes, were in reality only common school-boys.

The Lorelei.

I know not what it may mean to-day
That I am to grief inclined;
There's a tale of a Siren—an old-world lay—
That I can not get out of my mind.

The air is cool in the twilight gray,
And quietly flows the Rhine;
On the ridge of the cliff, at the close of the day
The rays of the sunset shine.

There sits a maiden, richly dight,
And wonderfully fair;
Her golden bracelet glistens bright
As she combs her golden hair.

And while she combs her locks so bright,
She sings a charming lay;
'Tis sweet, yet hath a marvelous might,
And 'tis echoing far away.

The sailor floats down, in the dusk, on the Rhine
That carol awakens his grief;
He sees on the cliff the last sunbeam shine,
But he sees not the perilous reef.

Ah! soon will the sailor, in bitter despair,
To his foundering skiff be clinging!
And that's what the beautiful Siren there
Has done with her charming singing.

FRIEDRICH SCHLEIERMACHER.

He was an admirable dialectician, and did more than any other writer to promote in Germany a sympathetic study of Plato. Yet there is a touch of Romanticism in the vague, shadowy and mystic language in which he presents the elements of Christian thought and life.—*Sime.*

Wilhelm Von Humboldt says that Schleiermacher's speaking far exceeded his power in writing, and that his strength consisted in the "deeply penetrative character of his words, which was free from art, and the persuasive effusion of feeling moving in perfect unison with one of the rarest intellects."—*American Cyclopædia.*

Extracts From Schleiermacher.

TRUE PLEASURE.—Pleasure is a flower which grows indeed of itself, but only in fruitful gardens and well cultivated fields. Not that we should labor in our minds to gain it; but yet he who has not labored for it, with him it will not grow; whoever has not brought out in his own character something profitable and praiseworthy, it is in vain for him to sow. Even he who understands it best can do nothing better for the pleasure of another than that he should communicate to him what is the foundation of his own. Whosoever does not know how to work up the rough stuff for himself, and thereby make it his own, whosoever does not refine his disposition, has not secured for himself a treasure of thoughts, a many sidedness of relations, a view of the world and human things peculiar to himself—such a man knows not how to seize the proper occasion for pleasure, and the most important is assuredly lost for him. It is not the indolent who finds so much difficulty in filling up the time set aside for repose. Who find vexation and ennui in everything? From whom are we hearing never ending complaints about the poverty and dull uniformity of life? Who are most bitter in their lamentations over the slender powers of men for social intercourse, and over the insufficiency of all

measures to obtain joy? But this is only what they deserve; for man cannot reap where he has not sown.

THE ESTEEM OF THE WORLD.—We all consider what is thought of us by those around us as a substantial good. Trust in our uprightness of character, belief in our abilities, and the desire that arises from this to be more intimately connected with us, and to gain our good opinion, everything of this kind is often a more valuable treasure than great riches. Of this the indolent are quite aware. If men would only believe in their capacity without the necessity of producing anything painstaking and really praiseworthy! If they would only agree to take some other proof of their probity and love of mankind than deeds! If they would only accept some other security for their wisdom than prudent language, good counsel, and a sound judgment on the proper mode of conducting the affairs of life! Instead of rising to a true love of honor, such men creep amidst childish vanities, which try to fix the attention of mankind by pitiful trifles and to glitter by shadowy appearances; instead of attempting to reach something really noble, they rest only on external customs; the mental disposition that arises from this is their virtue, and their governing passion is what they regard as understanding.

ARTHUR SCHOPENHAUER.

A young man not understood.—*Goethe*.

German philosophers have as a rule been utterly indifferent to style, but Schopenhauer's prose is clear, firm and graceful, and to this fact he owes much of his popularity.—*Simé*.

Our inductive science ends with the questions—"Whence?" "Wherefore?" We observe facts, and classify them; but then follows a question respecting the substance that lies behind the facts? What do they express? What is the Will of which they are the Representation?—If we were isolated from the world around us, we could not answer the question. But we are not so isolated. We belong to nature, and nature is included in ourselves. We have in ourselves the laws of the world around us. We find in our own bodies the mechanical laws, and those of the organic life manifested in plants and animals. We have the same understanding which we find working around us in the system of nature. If we consisted only of the body and the understanding, we could not distinguish ourselves from nature. If we know what is in ourselves, we know what is in nature. Now what do we find controlling the facts of our own natural life? An impulse which we may call the Will to live. We often use the word Will in a complex sense, as implying both thought and choice; but in its purest, simplest sense, as the word is used here, it means the impulse, or force, which is the cause of a phenomenon. In this sense, there is a Will from which the movements within the earth and upon its surface derive their origin. It works continuously upward from the forms of crystals, through the forms of zoöphytes, mollusca, annelida, insectia, arachnida, crustacea, pisces, reptilia, aves, and mammalia. There is one Will manifested in the growth of all plants and animals. That which we call a purpose when viewed as associated with intellect, is, when regarded most simply, or in itself, a force or impulse—the natural Will of which we are now speaking. It is the Will to live—the mighty impulse by which every creature is impelled to maintain its own existence, and without any care for the existence of others. It is an unconscious Egoism. Nature is apparently a collection of many wills; but all are reducible to one—the Will to live. Its whole life is a never-ending warfare. It is forever at strife *with itself*; for it asserts itself in one form to deny itself as asserted in other forms. It is everywhere furnished with the means of working out its purpose. Where the Will of the lion is found, we find the powerful limbs, the claws, the teeth necessary for supporting the life to which the animal is urged by his Will. The Will is found associated in man with an understanding; but is not subservient to that understand-

ing. On the contrary, the understanding or intellect is subservient. The Will is the moving power; the understanding is the instrument.

This one Will in nature and in ourselves serves to explain a great part of all the movements of human society. Hence arise the collisions of interest that excite envy, strife, and hatred between individuals or classes. Society differs from an unsocial state of life in the forms imposed by intelligence on egoistic Will, but not in any radical change made in that Will. Thus etiquette is the convenience of egoism, and law is a fixing of boundaries within which egoism may conveniently pursue its objects. The world around us, including what is called the social or civilized world, may seem fair, when it is viewed only as a stage, and without any reference to the tragedy that is acted upon it. But, viewed in its reality, it is an arena for gladiators, or an amphitheater where all who would be at peace have to defend themselves. As Voltaire says, it is with sword in hand that we must live and die. The man who expects to find peace and safety here is like the traveler told of in one of Gracian's stories, who, entering a district where he hoped to meet his fellow-men, 'found it peopled only by wolves and bears, while men had escaped to caves in a neighboring forest. The same egoistic Will that manifests itself dimly in the lowest stages of life, and becomes more and more clearly pronounced as we ascend to creatures of higher organization, attains its highest energy in man, and is here modified, but not essentially changed, by a superior intelligence. The insect world is full of slaughter; the sea hides from us frightful scenes of cruel rapacity; the tyrannical and destructive instinct marks the so-called king of birds, and rages in the feline tribes. In human society, some mitigation of this strife takes place as the result of experience and culture. By the use of the understanding, the Will makes laws for itself, so that the natural *bellum omnium contra omnes* is modified, and leaves to the few victors some opportunities of enjoying the results of their victory. Law is a means of reducing the evils of social strife to their most convenient form, and politics must be regarded in the same way. The strength of all law and government lies in our dread of the anarchic Will, that lies couched behind the barriers of society and is ready to spring forth when they are broken down.

READINGS IN PHYSICAL SCIENCE.*

V.—THE SEA.

[Continued.]

The sea is full of life, both of plants and animals. These organisms die, and their remains necessarily get mixed up with the different materials laid down upon the sea floor. So that, beside the mere sand and mud, great numbers of shells, corals, and the harder parts of other sea creatures must be buried there, as generation after generation comes and goes.

It often happens that on parts of the sea bed the remains of some of these animals are so abundant that they themselves form thick and wide-spread deposits. Oysters, for example, grow thickly together; and their shells, mingled with those of other similar creatures, form what are called shell banks. In the Pacific and the Indian Oceans a little animal, called the coral-polyp, secretes a hard limy skeleton from the sea water; and as millions of these polyps grow together, they form great reefs of solid rock, which are sometimes, as in the Great Barrier Reef of Australia, hundreds of feet thick and a thousand miles long. It is by means of the growth of these animals that those wonderful rings of coral rock or coral islands are formed in the middle of the ocean. Again, a great part of the bed of the Atlantic Ocean is covered with fine mud, which on examination is found to consist almost wholly of the remains of very minute animals called foraminifera.

* Abridged from Professor Geikie's *Primer of Physical Geography*.

Over the bottom of the sea, therefore, great beds of sand and mud, mingled with the remains of plants and animals, are always accumulating. If now this bottom could be raised up above the sea level, even though the sand and mud should get as dry and hard as any rock among the hills, you would be able to say with certainty that they had once been under the sea, because you would find in them the shells and other remains of marine animals. This raising of the sea bottom has often taken place in ancient times. You will find most of the rocks of our hills and valleys to have been originally laid down in the sea, where they were formed out of sand and mud dropped on the sea floor, just as sand and mud are carried out to sea and laid down there now. And in these rocks, not merely near the shore, but far inland, in quarries or ravines, or the sides and even the tops of the hills, you will be able to pick out the skeletons and fragments of the various sea creatures which were living in the old seas.

Since the bottom of the sea forms the great receptacle into which the mouldered remains of the surface of the land are continually carried, it is plain that if this state of things were to go on without modification or hindrance, in the end the whole of the solid land would be worn away, and its remains would be spread out on the sea floor, leaving one vast ocean to roll round the globe.

But there is in nature another force which here comes into play to retard the destruction of the land.

THE INSIDE OF THE EARTH.

It may seem at first as if it were hopeless that man should ever know anything about the earth's interior. Just think what a huge ball this globe of ours is, and you will see that after all, in living and moving over its surface, we are merely like flies walking over a great hill. All that can be seen from the top of the highest mountain to the bottom of the deepest mine is not more in comparison than the mere varnish on the outside of a school globe. And yet a good deal can be learnt as to what takes place within the earth. Here and there, in different countries, there are places where communication exists between the interior and the surface; and it is from such places that much of our information on this subject is derived. Volcanoes are among the most important of the channels of communication with the interior.

Let us suppose that you were to visit one of these volcanoes just before what is called "an eruption." As you approach it, you see a conical mountain, seemingly with its top cut off. From this truncated summit a white cloud rises. But it is not quite such a cloud as you would see on a hill top in this country. For as you watch it you notice that it rises out of the top of the mountain, even though there are no clouds to be seen anywhere else. Ascending from the vegetation of the lower grounds, you find the slopes to consist partly of loose stones and ashes, partly of rough black sheets of rock, like the slags of an iron furnace. As you get nearer the top the ground feels hot, and puffs of steam, together with stifling vapors, come out of it here and there. At last you reach the summit, and there what seemed a level top is seen to be in reality a great basin, with steep walls descending into the depths of the mountain. Screening your face as well as possible from the hot gases which almost choke you, you creep to the top of this basin, and look down into it. Far below, at the base of the rough red and yellow cliffs which form its sides, lies a pool of some liquid, glowing with a white heat, though covered for the most part with a black crust like that seen on the outside of the mountain during the ascent. From this fiery pool jets of the red hot liquid are jerked out every now and then, stones and dust are cast up into the air, and fall back again, and clouds of steam ascend from the same source and form the uprising cloud which is seen from a great distance hanging over the mountain.

This caldron-shaped hollow on the summit of the mountain is the crater. The intensely heated liquid in the sput-

tering boiling pool at its bottom is melted rock or lava. And the fragmentary materials—ashes, dust, cinders, and stones—thrown out, are torn from the hardened sides and bottom of the crater by the violence of the explosions with which the gases and steam escape.

The hot air and steam, and the melted mass at the bottom of the crater, show that there must be some source of intense heat underneath. And as the heat has been coming out for hundreds, or even thousands of years, it must exist there in great abundance.

But it is when the volcano appears in active eruption that the power of this underground heat shows itself most markedly. For a day or two beforehand, the ground around the mountain trembles. At length, in a series of violent explosions, the heart of the volcano is torn open, and perhaps its upper part is blown into the air. Huge clouds of steam roll away up into the air, mingled with fine dust and red hot stones. The heavier stones fall back again into the crater or on the outer slopes of the mountain, but the finer ashes come out in such quantity, as sometimes to darken the sky for many miles round, and to settle down over the surrounding country as a thick covering. Streams of white hot molten lava run down the outside of the mountain, and descend even to the gardens and houses at the base, burning up or overflowing whatever lies in their path. This state of matters continues for days or weeks, until the volcano exhausts itself, and then a time of comparative quiet comes, when only steam, hot vapors, and gases are given off.

About 1800 years ago, there was a mountain near Naples shaped like a volcano, and with a large crater covered with brushwood. No one had ever seen any steam, or ashes, or lava come from it, and the people did not imagine it to be a volcano, like some other mountains in that part of Europe. They had built villages and towns around its base, and their district, from its beauty and soft climate, used to attract wealthy Romans to build villas there. But at last, after hardly any warning, the whole of the higher part of the mountain was blown into the air with terrific explosions. Such showers of fine ashes fell for miles around, that the sky was as dark as midnight. Day and night the ashes and stones descended on the surrounding country; many of the inhabitants were killed, either by stones falling on them, or from suffocation by the dust. When at last the eruption ceased, the district, which had before drawn visitors from all parts of the old world, was found to be a mere desert of grey dust and stone. Towns and villages, vineyards and gardens, were all buried. Of the towns, the two most noted were called Herculaneum and Pompeii. So completely did they disappear, that, although important places at the time, their very sites were forgotten, and only by accident, after the lapse of some fifteen hundred years, were they discovered. Excavations have since that time been carried on, the hardened volcanic accumulations have been removed from the old city, and you can now walk through the streets of Pompeii again, with their roofless dwelling houses and shops, theaters and temples, and mark on the causeway the deep ruts worn by the carriage wheels of the Pompeians eighteen centuries ago. Beyond the walls of the now silent city rises Mount Vesuvius, with its smoking crater, covering one half of the old mountain which was blown up when Pompeii disappeared.

Volcanoes, then, mark the position of some of the holes or orifices, whereby heated materials from the inside of the earth are thrown up to the surface. They occur in all quarters of the globe. In Europe, beside Mount Vesuvius, which has been more or less active since it was formed, Etna, Stromboli, and other smaller volcanoes, occur in the basin of the Mediterranean, while far to the northwest some volcanoes rise amid the snows and glaciers of Iceland. In America a chain of huge volcanoes stretches down the range of mountains which rises from the western margin of the continent. In Asia they are thickly grouped together in Java and some of the surrounding islands, and stretch thence through Japan and the Aleutian

Isles, to the extremity of North America. If you trace this distribution upon the map, you will see that the Pacific Ocean is girded all round with volcanoes.

Since these openings into the interior of the earth are so numerous over the surface, we may conclude that this interior is intensely hot. But we have other proofs of this internal heat. In many countries hot springs rise to the surface. Even in England, which is a long way from any active volcano, the water of the wells of Bath is quite warm (120° Fahr.). It is known, too, that in all countries the heat increases as we descend into the earth. The deeper a mine the warmer are the rocks and air at its bottom. If the heat continues to increase in the same proportion, the rocks must be red hot at no great distance beneath us.

It is not merely by volcanoes and hot springs, however, that the internal heat of the earth affects the surface. The solid ground is made to tremble, or is rent asunder, or is upheaved or let down. You have probably heard or read of earthquakes; those shakings of the ground, which, when they are at their worst, crack the ground open, throw down trees and buildings, and bury hundreds or thousands of people in the ruins. Earthquakes are most common in or near those countries where active volcanoes exist. They frequently take place just before a volcanic eruption.

Some parts of the land are slowly rising out of the sea; rocks, which used always to be covered by the tides, come to be wholly beyond their limits; while others, which used never to be seen at all, begin one by one to show their heads above water. On the other hand some tracts are slowly sinking; piers, sea walls, and other old landmarks on the beach, are one after another enveloped by the sea as it encroaches further and higher on the land. These movements, whether in an upward or downward direction, are likewise due in some way to the internal heat.

Now when you reflect upon these various changes you will see that through the agency of this same internal heat land is preserved upon the face of the earth. If rain and frost, rivers, glaciers, and the sea were to go on wearing down the surface of the land continually, without any counterbalancing kind of action, the land would necessarily in the end disappear, and indeed would have disappeared long ago. But owing to the pushing out of some parts of the earth's surface by the movements of the heated materials inside, portions of the land are raised to a higher level, while parts of the bed of the sea are actually upheaved so as to form land.

This kind of elevation has happened many times in all quarters of the globe. As already mentioned most of our hills and valleys are formed of rocks, which were originally laid down on the bottom of the sea, and have been subsequently raised into land.

This earth of ours is the scene of continual movement and change. The atmosphere which encircles it is continually in motion, diffusing heat, light, and vapor. From the sea and from the waters of the land, vapor is constantly passing into the air, whence, condensed into clouds, rain and snow, it descends again to the earth. All over the surface of the land the water which falls from the sky courses seaward in brooks and rivers, bearing into the great deep the materials which are worn away from the land. Water is thus ceaselessly circulating between the air, the land, and the sea. The sea, too, is never at rest. Its waves gnaw the edges of the land, and its currents sweep round the globe. Into its depths the spoils of the land are borne, there to gather into rocks, out of which new islands and continents will eventually be formed. Lastly, inside the earth is lodged a vast store of heat by which the surface is shaken, rent open, upraised or depressed. Thus, while old land is submerged beneath the sea, new tracts are upheaved, to be clothed with vegetation and peopled with animals, and to form a fitting abode for man himself.

This world is not a living being, like a plant or an animal,

and yet you must now see that there is a sense in which we may speak of it as such. The circulation of air and water, the interchange of sea and land; in short the system of endless and continual movement by which the face of the globe is day by day altered and renewed, may well be called the Life of the Earth.

SUNDAY READINGS.

SELECTED BY THE REV. J. H. VINCENT, D.D.

AM I NOT IN SPORT?

By JAMES WALKER, D.D., LL.D.

[February 3.]

"As a madman who casteth firebrands, arrows, and death, so is the man who deceiveth his neighbor, and saith, 'Am I not in sport?'" Proverbs xxvi, 18:19.

It is incalculable how much pain is inflicted, and how much injury is done, without anything which can properly be called malicious intent, or deliberate wrong. Thus there are those who, like the madman mentioned in Scripture, will cast firebrands, arrows, and death, and then think it a sufficient excuse to say, "Are we not in sport?" Let it be that they *are*; I think it will not be difficult to show that this will not excuse, or do much to palliate, the conduct in question. I think it will not be difficult to show that men are answerable for the mischiefs they do from mere wantonness or in sport, and that it is wrongdoing of this description which makes up no inconsiderable part of every one's guilt.

It is to little or no purpose to be able to say that such offences do not originate in conscious malice, for, as has just been intimated, the same is true of a large proportion of acknowledged crimes. It is seldom, very seldom, that men injure one another from hatred, or for the sake of revenge—because they find, or expect to find, any pleasure in the mere consciousness of inflicting pain. Men injure one another from wantonness, or want of consideration; or, more commonly still, because the carrying out of their policy, or their prejudices, or their sport, happens to interfere with the interests and comfort of others, and, though really sorry for this, they are not prepared to give up either their policy or their prejudices, or their sport to spare another's feelings. Wars are waged and conquests made, mourning and desolation spread through a whole country, in the wantonness of honor, or to gratify an insatiable ambition; but without anything which can properly be called malice, either in the first movers or immediate agents. Men opposed to each other in politics or religion will allow this opposition to go to very unjustifiable lengths, even to the disturbing of the peace of neighborhoods, and the breaking of friendships and family connections; and all this, to be sure, must give rise to a great deal of ill-will and hot blood; but it does not originate in malice, properly so called—in positive malice toward anybody. Likewise a rash and improvident man may bring incalculable mischief on all connected with him, involving them in pecuniary difficulties, or committing and paining them in other ways, and yet be able to allege with perfect truth that he did not mean to do them any harm; that, so far from being actuated by malice, he feels nothing and has felt nothing but the sincerest affection for the very persons whom he has injured, and most affection, perhaps, for those whom he has most injured. But why multiply illustrations? The whole catalogue of the vices of self-indulgence and excess—black and comprehensive as it is—has nothing to do with malicious intent; that is to say, these vices do not find any part of their temptation or gratification in ill-will to others, or in the consciousness of causing misery to others. And yet who, on this account, denies that they are vices, or that they are among the worst of vices?

The moral perplexity existing in some minds on this subject may be traced to two errors: making malice to be the *only* bad

motive by which we can be actuated and confounding the mere *absence of malice* with that active principle of benevolence, or love of our neighbor, which Christianity makes to be the foundation and substance of all true social virtue.

How unfounded the first of these assumptions is, appears generally from what has been said; but the same may also be shown on strictly ethical grounds. We must distinguish between what is simply *odious*, and what is immoral. The malignant passions when acted out by animals are odious, but they are not immoral, because they are not comprehended in that light by the agent. The reason why the malignant passions are immoral in man is that he knows them to be immoral; and accordingly any other passion, which he knows to be immoral, becomes for the same reason alike immoral to him as a principle of conduct. Hence it follows that, though not actuated by malice, we may be by some other motive equally reprehensible in a moral point of view, though not perhaps as odious—by the love of ease, by vanity or pride, by unjust partialities, by inordinate ambition, by avarice or lust—dispositions which have nothing to do with malice, but yet are felt and acknowledged by all to be bad and immoral.

[February 10.]

Moreover, the tendencies of modern civilization are to be considered in this connection. Times of violence are gradually giving place to times of self-indulgence and fraud; and the consequence is that now, where one man is betrayed into vices of malevolence and outrage, twenty are betrayed into those of frivolity, licentiousness, or overreaching. I go further still. Suppose a man actuated by none of these positively bad motives; nay, suppose the injury done to be accidental and wholly unintentional, this will not in all cases justify the deed. The question still arises whether the injury done, supposing it to be wholly unintentional, might not have been foreseen, and ought not to have been foreseen; for, where the well-being of others is concerned, we are bound not only to mean no harm, but to take care to avoid everything which is likely to do harm; and negligence in this respect is itself a crime. So obviously just is this principle, so entirely does it approve itself to the reason and common sense of mankind, that we find it everywhere recognized, in some form or other, in the jurisprudence of civilized countries. "When a workman flings down a stone or piece of timber into the street, and kills a man, this may be either misadventure, manslaughter, or murder, according to the circumstances under which the original act is done. If it were in a country village, where a few passengers are, and he calls out to all people to have a care, it is misadventure only; but if it were in London, or other populous town, where people are continually passing, it is manslaughter, though he gives loud warning; and murder, if he knows of their passing and gives no warning at all, for then it is malice against all mankind."*

Equally groundless is the second of the above mentioned assumptions, to wit: that of confounding the mere *absence of malice* with the active principle of benevolence itself or that love of our neighbor which Christianity makes to be the foundation and substance of all true social virtue. There is nothing, perhaps, which more essentially distinguishes worldly propriety and legal honesty from Christian virtue than this, that they stop with negatives. They are content with avoiding what is expressly forbidden, not reflecting that this, at the best, only makes men to be *not bad*; it does not make them to be good. Besides, if we take this ground, if we allege the absence of all anger and resentment, we bar the plea that we were hurried into the act by the impetuosity of our passions—a plea which the experience of a common infirmity has always led men to regard as the strongest extenuating circumstance of wrongdoing. If we have given pain to a fellow creature, it is stating an aggravation of the fault and not an excuse, to say that we

did not do it in passion, but in cold blood; and worse still, if we say that we did it in sport. What! find sport in giving pain to others? This may consist, I suppose, with the absence of what is commonly understood by malice; but I utterly deny its compatibility with active Christian benevolence, or with what indeed amounts to the same thing, a kind, generous, and magnanimous nature. Were I in quest of facts to prove the total depravity of man, I should eagerly seize on such as the following: The shouts of heartless merriment sometimes heard to arise from a crowd of idlers collected around a miserable object in the streets; a propensity to turn into ridicule, not merely the faults and affectations of others, but their natural deformities or defects; jesting with sacred things, or practical jests, the consequences of which to one of the parties are of the most serious and painful character; and the pleasure with which men listen to sarcastic remarks though causeless and unprovoked, or to wit the whole point of which consists in its sting. Not that the doctrine of universal and total depravity is actually proved even by such conduct, for happily the conduct itself is not universal; to some it is repugnant from the beginning; and besides, even where it is fallen into, I suppose it is to be referred in a majority of cases to a love of excitement, rather than to a love of evil for its own sake. Still I maintain that the conduct in question, however explained, is incompatible, or at any rate utterly inconsistent, with thoughtful and generous natures.

[February 17.]

Still, many who would not think entirely to excuse the conduct in question can find palliations for it and extenuating circumstances, some of which it will be well to examine.

In the first place it is said that the sport is not found in the sufferings of the victim, but in the awkward and ludicrous situations and embarrassments into which he is thrown. Now I admit, that, if these awkwardnesses and absurdities could be entirely disconnected with the idea of pain, they might amuse even a good mind; but as they can not be thus disconnected—as all this is known and seen to be the expression of anguish either of body or mind, or to be the consequence of some natural defect or misfortune, or some cruel imposition on weakness or good nature—I affirm as before, that he whose mirth is not checked by this single consideration betrays a want of true benevolence, and even of common humanity. Neither will it help the matter much to say that the pain and mortification are not known, are not seen, or at least *are not attended to*; that this view of the subject is entirely overlooked, the mind being wholly taken up with its ludicrous aspects. For how comes it that we have so quick a sense to everything ludicrous in the situation and conduct of others, but no sense at all to their sufferings? Our hearts, it would seem, are not as yet steeled against all sympathy in the sufferings and misfortunes of our neighbors, provided we can be made to apprehend and realize them; and this is well; but why *so slow* to apprehend and realize them? If, though directly before our eyes, the thought of them never occurs to our minds; if we can say, and say with truth, that while we enjoy the sport it never once occurred to us that it was at the expense of another's feelings, though this fact was all the time staring us in the face—does it not at least betray a degree of indifference or carelessness about the feelings of others, which is only compatible with a cold and selfish temper? Put whatever construction you will, therefore, on this kind of sport, it argues a bad state of the affections; for either its connection with the pain and mortification of others is perceived, and then it is downright cruelty; or it is not perceived, and then it is downright insensibility.

Another ground is sometimes taken. There are those who will say, "We cannot help it. Persons of a constitution less susceptible to the ludicrous, or less quick to observe it, may do differently, but we can not." Obviously, however, reasonings of this sort, if intended as a valid excuse, betray a singular and

* Blackstone.

almost hopeless confusion of moral ideas. They cannot help it? Of course they do not mean that they would be affected in the same way by the same thing, under all circumstances and in all states of feeling. Let the coarse jest be at the expense of a parent, or of a sister; or let its tendency be to bring derision on an office, a cause, or a doctrine which we have much at heart; or let it offend beyond a certain point against the conventional usages of what is called good society—and, instead of provoking mirth, it provokes indignation or contempt. All they can mean, therefore, is simply this: Their sense of the ludicrous is so keen, that, when not restrained by some present feeling of justice, humanity, or decorum, it becomes irrepressible. Undoubtedly it does; but this is no more than what might be said of the worst crimes of sensuality and excess. What would you think if a sordid man should plead, that being sordid by nature, and not having any high principle or feeling to restrain him, he cannot help acting sordidly? Does he not know that it is this want of high principle and feeling which constitutes the very essence of his sin? We have shown that to find sport in what gives pain, argues a bad state of the principles and affections. Manifestly, therefore, it is to no purpose to urge as an excuse, that in the existing state of our principles and affections we can not help it; for the existing state of our principles and affections is the very thing which is complained of and condemned.

It may be contended, as a last resort, that this state of mind is consistent, to say the least, with amiable manners, companionable qualities, and good nature. But if herein is meant to be included real kindness of heart, or the highest forms of generosity and nobleness of soul, I deny that it can be. There is no necessity of trying to make it out that men of this stamp are worse than they really are. Unquestionably they can and often do make themselves agreeable and entertaining, especially to those who are not very scrupulous about the occasions of their mirth, and feel no repugnance to join in a laugh which perhaps they would hesitate to raise. Good-natured also they may be, if nothing more is meant by this than the absence of an unaccommodating, morose, and churlish disposition; for there are two sorts of good nature, the good nature of benevolence, and the good nature of ease and indifference. The first will not consist, as we have seen, with wrong-doing from wantonness or in sport; but the last may; yet even when it does, not much credit can accrue from this circumstance. Worthy of all honor is that good nature which springs from genuine kindness and sympathy, or a desire to make and to see everybody happy; but the same can hardly be said of what often passes for good-nature in the world, though it is nothing but the result of an easy temper and loose principles.

[February 24.]

Still, I can not but think that a large majority of those who sometimes look for sport in wrong-doing have enough of humanity and of justice to restrain them, if they could only be made to understand and feel the extent of the injury thus occasioned. Take, for example, jesting with sacred things. Its influence on those who indulge in it is worse than that of infidelity, for it destroys our reverence, and it is harder to recover our reverence, after it has been lost, than our convictions. Nay, it is often worse than that of daring crime; the latter puts us in opposition to religion, but it does not necessarily undermine our respect for it, or the sentiment on which the whole rests. Consider, too, its effect on others. The multitude are apt to mistake what is laughed at by their superiors for what is ridiculous in itself. In France it was not the sober arguments of a knot of misguided atheists, but the scoffs and mockeries and ill-timed pleasantries in which the higher classes generally shared, which destroyed the popular sense of the sanctity of religion; and when this great regulative principle of society was gone, it was not long before the mischief came back, amidst scenes of popular license and desperation, "to

plague the inventors." And so of cruel sports. In reading the Sermon on the Mount, you must have been struck with the fact that, while he who is angry with his brother is only said to be in danger of the judgment, "whosoever shall say, thou fool, shall be in danger of hell fire." But, on second thoughts, is this anything more than a simple recognition of what we all know to be true; that hatred does not inflict half so deep or bitter a feeling of wrong as scorn? Much is said about the disorganizing doctrines and theories of the day, but, bad as these are, they are not likely to do so much to exasperate the poor against the rich, and break down the bulwarks of order and law, as the conduct of some among the rich themselves. The time was when the few could trample with indifference on the interests and feelings of the many, and make sport of their complaints with impunity, but that time has passed away.

One word also on those cruel sports where animals, and not men, are the sufferers. Cruelty to animals is essentially the same feeling with cruelty to a fellow-creature, and in some respects it is even more unbecoming. Man is as a god to the inferior races. To abuse the power which this gives us over the helpless beings that Providence has placed at our mercy, is as mean as it is inhuman. If we would listen to the pleadings of what is noble and generous in our natures, it would be as impossible for us needlessly to harm an unoffending animal, as it would be to strike an infant or an idiot. Shame on the craven who quails before his equals, and then goes away and wreaks his unmanly resentments on a creature which he knows can neither retaliate nor speak! Besides, we may suppose that there are orders of beings above us, as well as below us. Look then at our treatment of the lower animals, and then ask yourselves what we should think, if a superior order of beings should mete out to us the same measure. What if in mere wantonness, or to pamper unnatural tastes, they should subject us to every imaginable hardship and wrong? What if they should make a show, a public recreation, of our foolish contests and dying agonies? Nay, more; what if it should come to this, that in their language a man-killer should be called a *sportsman* by way of distinction?

But I must close. We have it on the authority of the Bible, and we read it in the constitution of man, that there is "a time to weep and a time to laugh." There will also be ample scope or the legitimate action of caustic wit, so long as there are follies to be shown up, pretenders to be unmasked, and conceit and affectation to be taught to know themselves. But, in the serious strifes of the world, the ultimate advantages of this weapon, though wielded on the right side, are more than dubious. "The Spaniards have lamented," it has been said, "and I believe truly, that Cervantes' just and inimitable ridicule of knight-errantry rooted up, with that folly, a great deal of their real honor. And it was apparent that Butler's fine satire on fanaticism contributed not a little, during the licentious times of Charles II., to bring sober piety into disrepute. The reason is evident; there are many lines of resemblance between truth and its counterfeits; and it is the province of wit only to find out the likenesses in things, and not the talent of the common admirers of it to discover the differences." At any rate we can shun the rock of small wits who think to make up for poverty of invention by a scurrility and grimace, who think to gain from the venom of the shaft what is wanting in the vigor of the bow. We can imitate the example of those among the great masters of wit in all ages, who have ennobled it by purity of expression and a moral aim; so that, in the end, virtue may not have occasion to blush, or humanity to mourn, for anything we have said or done. Take any other course and we are reminded of the confession which experience wrung from the lips of the wise man: "I said in my heart, go to now, I will prove thee with mirth; therefore enjoy pleasure; and behold this also is vanity. I said of laughter, it is mad; and of mirth, what doeth it?" "Even in laughter the heart is sorrowful, and the end of that mirth is heaviness."

COMMERCIAL LAW.

By EDWARD C. REYNOLDS, Esq.

I.—LAW IN GENERAL.
